Supplies of Perry.—While cider apples were plentiful in 1908, writes Mr. C. W. Radcliffe Cook, perry pears, except in a few favoured spots, were conspicuous by their absence. This was especially the case with the best sorts, such as Taynton Squash, Barland, Oldfield, and Moorcroft. The deficiency of this fruit is felt almost exclusively in the counties of Hereford, Gloucester, Worcester, and parts of Monmouth, as the perry pear is unknown in Devon and Somerset. It not uncommonly happens that in a year when the apple crop is scanty pear trees bear well and so help to fill the hogshead. Pear trees, growing to a much larger size than apple trees, bearing consequently heavier crops, and being far longer lived, constitute a valuable asset to the makers of champagne in France and to the cider makers in England; for although perry is not so well known to the bulk of the community as is cider, it is much appreciated in the districts in which it is made. Some perry, too, so closely resembles cider as only to be distinguished therefrom by an unusually keen or a trained palate. A blend of cider and perry makes, in the opinion of many good judges, a better drink than cider makes alone; certain choice varieties of each fruit excepted. When, therefore, cider runs short, perry can be blended with it without detriment to the consumer and with advantage to the maker.

Shropshire Flower Show is to be held on August 18 and 19, and will be on the same magnificent scale as in previous years. Plants have ample provision made for them, and in the class for groups of flowering and ornamental-leaved plants, the three prizes aggregate £60, while for the groups of fine foliage plants the amount offered as prizes is only £5 less. Fifteen stove and greenhouse plants have been allocated prizes of the value of £42, and in the class for thirty stove and greenhouse plants in pots not exceeding ten inches in diameter the prizes aggregate £45. The class for champion decorated fruit [illegible] is retained, and in this the six prizes [illegible] from £20 to £5, and in addition the winner of the first prize takes the champion silver cup of the value of twenty-five guineas, which has to be won three times, and the society's large gold medal. The classes for collections of vegetables are less numerous than usual, but those for single dishes have been augmented, and cultivators with the fifty odd classes have full opportunity for demonstrating their skill in the production of kitchen garden crops.

Mr. C. Harman Payne has been elected a member of the chrysanthemum section of the Floral Committee of the Société Nationale d'Horticulture de France, a distinction not previously conferred upon a foreigner, and our old friend and correspondent has our heartiest congratulations on the distinction he has received.

LILIUM SPECIOSUM.

Although we are often told that all lily bulbs should be potted or planted in the autumn, the fact remains that the best examples of Lilium speciosum and L. auratum, the supplies of which we obtain principally from Japan, do not, as a rule, reach here much before Christmas, while for a couple of months or so later than that splendid bulbs for either potting or planting can be obtained.

Lilium longiflorum, which Japan sends in its hundreds of thousands, blooms and goes to rest earlier than the two species previously mentioned, and consequently the first importations of the long-flowered lily reach here before autumn has left us, usually towards the latter part of October or in November. Successional batches are, however, sent over till long after that. In the case of the later arrivals it will be often found that the bulbs, when unpacked, are rooting freely into the clayey soil used for packing purposes.

Concerning Lilium speciosum it may be pointed out that though it is still grown by the Dutch, whose supplies reach here in the autumn, yet the numbers sent from Holland are nothing compared with the Japanese importations. The bulbs of this lily travel, as a rule, in splendid condition, and are ready to commence rooting directly they are potted. Some of these Japanese bulbs are of immense size, particularly those of the coloured varieties. Generally speaking, they are seldom disposed of under any varietal names, except those of rubrum and Melpomene, but from them can be picked out several beautiful and interesting forms. Some are delicately tinted, but the majority are remarkable for their rich colouring. In time of flowering, too, there is a certain amount of variation. The white-flowered kinds mainly consist of Krætzeri, with a few of album novum. This last is really a white form of an old variety known as punctatum, and remarkable for its bright yellow anthers.

Of those commonly grown by the Dutch there are two that I have never seen among the Japanese importations, viz., punctatum itself, a white flower dotted with pink, and album, which is totally distinct in bulb and flower from any Japanese form.

Lilium speciosum has many desirable qualities. In the first place it is not at all exacting in its requirements, and readily lends itself to pot culture. Next it is but rarely troubled by insect pests, while the blossoms have not the heavy overpowering scent of some lilies. Its normal season of flowering, too, is just as many summer-flowering subjects are on the wane, though, as the bulbs are now so readily retarded, it may be had in bloom at any season of the year

Concerning the early history of Lilium speciosum, the following interesting details occur in a French publication entitled "Monographie, Historique et Littéraire des Lis," par Fr. de Cannart d'Hamale, Malines, 1870. The entire note is too long for reproduction here, but, translated freely and briefly, it is stated that: Among some Japanese lilies which Dr. Von Siebold gave to the care of M. Mussche, chief of the Botanic Garden at Ghent, where Lilium speciosum of Thumberg, wrongly called L. lancifolium in gardens. This lily flowered for the first time at the University Botanic Garden at Ghent, in August, 1832. The beauty and elegance of its flowers caused at the time quite a sensation among the principal Belgian amateurs. The white variety flowered in the same establishment a year later, viz., August, 1833.

Concerning the variety punctatum above alluded to, the author says that Dr. Von Siebold could not recall ever having seen it in Japan, T.

IVY AND ARCHITECTURE.

Very wide are the differences of opinion among garden lovers as to the real value or otherwise of ivy in conjunction with architectural features. It is said, and not without cause, that ivy may become a real danger to architectural features in the garden by reason of the power exerted by its strong, sinuous stems and the action of its stem-roots. On the other hand, few deny the beauty of well-kept ivy upon house walls, gate pillars, terrace walls, and the balustrading of terrace steps. After all, a great deal depends upon the way in which the ivy is cared for. An annual close trimming in early spring, March for preference, is a necessity, for the sake of cleanliness, and to permit one to see where new growths are extending in a way that may lead to damage to the support. At Lord Hillingdon's beautiful garden, Hillingdon Court, Uxbridge, the ornamental terrace walls and balustrading, and the pillars on either side of the curved terrace steps, are clothed with ivy, and small, neatly-kept bushes of tree ivies are planted in the border below. The effect is very fine, especially as the climbing ivy has not been allowed to hide the architectural beauty of the terrace. The accompanying illustration admirably illustrates the scene along the front, with the terrace steps in the centre.

IVY AND ARCHITECTURE: THE TERRACE AND STEPS AT HILLINGDON COURT, UXBRIDGE.

SEEDS AND SEED SOWING.

Every seed is provided with an embryo, the vitality of which remains dormant so long as the carbon which the seed contains is not eliminated, by forming carbonic acid with oxygen during the process of germination. It has been fully demonstrated in the Rothamsted investigations that the composition of a seed is less liable to vary than that of any other part of a plant.

One of the most wonderful works of nature is the provision made for the perpetuation of the species. Every seed germ, or embryo, is really a plant in miniature, having its stem and leaves in a more or less undeveloped state.

If kept dry, and excluded from air and its oxygen, the duration of its vitality differs with different seeds. If the seed of any given plant which ordinarily retains its vitality for an extended period, is, when fully matured, thoroughly dried, and perfectly protected from contact with air and moisture, there is no reason why it may not retain its vitality for many years.

There is considerable difference of opinion between experimenters in regard to the duration of vitality in horticultural and agricultural seeds under ordinary climatic influences; but it probably depends upon the comparative condition of the seed and the influence of the different climates of their respective countries. Mons. Vilmorin, the well-known seed grower in France, states that few horticultural seeds can be depended upon to germinate after six years, and that the onion loses its germinating power after two years.

Some seeds lose their germinating power if allowed to become dry, as will those of the willow, two weeks after ripening. Experience has taught that fresh seeds of cucumbers, melons, etc., produce plants that are likely to run to vine, while older seeds yield more abundant crops of fruit. Old seeds, endowed with weaker vitality, are slower to germinate; they come up irregularly, and too large a percentage is absolutely sterile. Seeds of ten-weeks stock, four years old, are used by gardeners to produce plants to bear double flowers, while fresh seeds produce the more perfect single flowers. Such being the case, only fresh tomato seed should be used, as the double flowers produce irregularly-shaped, knobby fruit, while it is only the single flowers that form the desirable round and smooth fruit

The chemical constituents in an imperfectly matured seed seem unstably combined. If such germinate at all, it will be sooner than seeds fully ripe, but the plants will be of weaker growth, owing, probably, to an insufficient storage of nourishment. Such unripe seeds will also be the earliest to become sterile. Some vegetable physiologists believe that immature seeds will produce earlier varieties than the mature. There are many facts in regard to the distribution and germination of seeds which appear unaccountable and wonderful. After the destruction of forests or prairies by fire certain plants will spring up in large numbers, although no parent plants of the same species may have been growing in the vicinity. The Rothamsted experiments on permanent pasture show that the character of the herbage, and the description of the plants may be entirely changed by altering the manures and without any sowing of seeds. The unavoidable conclusion is, that the seeds had remained in the soil for years, awaiting favourable conditions for their development.

Plants, unlike any in the vicinity, have grown in the soil excavated from deep wells; thus the upper crust of the earth seems full of seeds.

No safe rule can be established as to the depth at which different seeds should be sown, as the weather and varieties of soil must be considered. If continued damp weather could be assured, the rule to cover the seed to a depth equal to its own thickness might be a safe one. In such case seeds would germinate if merely laid upon the surface, although darkness is more favourable for the formation of carbonic acid, and therefore for germination. In this matter the gardener must in each instance be governed by the character of his seed, and by the conditions of weather and nature of soil which obtain at the time. Seeds should never be sown, particularly on sandy soils, when the ground, from previous drought, is very dry below, with the surface only moist from recent rain, for if rain does not follow the seeds may perish after germination has merely commenced, or the lower soil may be too dry a little later to supply the young root with sufficient moisture.

At whatever depth the seeds are sown, the soil should have been carefully broken up or "fined" before sowing. After the seeds are sown the soil, if light and friable, should be "firmed" by patting it with the back of a spade, in order to bring the soil in close contact with the seeds. For large areas a light roller may be employed for this purpose. J. J. Willis.

Harpenden.

NOTES FROM SCOTLAND.

Early Potato Planting.

The fine dry weather in the autumn of last year was largely taken advantage of by growers of potatoes for the early markets to have the ground well and deeply broken up in readiness for the succeeding planting season. This having arrived, another favourable period is being experienced, the middle part of the month of February having been exceptionally dry and mild, and land ploughed as stated, and left rough for the winter, has become thoroughly sweetened and pulverised, thus minimising the labour and cost of planting very considerably.

Notwithstanding the general abundance of potato crops last year, and the large stocks of sound, well-ripened tubers still on hand in many cases, which, if well looked after, will probably carry the supply well into the coming summer, growers for the early markets appear none the less energetic and hopeful than in former years, and ere the close of the month large breadths of land will in all probability be thus occupied. During the past season prices were considerably lower than in the one immediately preceding it, the larger and earlier crop, together with the effects wrought by the industrial depression in the larger centres of population, accounting mainly for this. Among market growers on a large scale new varieties for early use are looked upon with a certain amount of suspicion, which arises, in the first place, from the uncertainty of the cropping qualities and earliness of the newcomer, and, secondly, the time required to get sufficient tubers of the right stamp to plant a large area. In some districts, and these among the foremost in the enterprise, Puritan still holds the lead, while in others it is largely displaced by Epicure, which, year by year, is more extensively grown. Several others find a place among first earlies, but those named are certainly the most highly esteemed at the present time. It may be stated in passing that quality is of less consequence than earliness, and a fair, uniform sample, suitable for market towards the end of June, and this is borne out by the fact that neither Puritan nor Epicure are much in favour among gardeners, though upon certain soils both do well, and are passable for quality.

Seed Storing and Planting.

Very diverse methods are adopted in the saving and storing the seed tubers, and many cultivators make the selection when lifting the crop, the tubers being placed in shallow boxes, and perhaps are turned or placed on end at some time during autumn or early winter to facilitate sprouting. The boxes are constructed in a way that readily admits of their being placed one upon the other without injuring their contents, thus economising space and allowing air to circulate freely all round. Owing to the length of time the tubers are housed in this way but little inducement by way of warmth is required to have the sprouting process sufficiently advanced in time for planting, consequently a cool, but frost-proof building fulfils the purpose very well. The bustle and animation manifested in a potato growing district during a spell of good weather at this season is interesting from various standpoints, and form a striking contrast to the previous quietness and solitude of the fields to which in rural districts one gets accustomed during the winter months.

All available hands employed regularly upon the farm are pressed into service for carrying out the principal work, while the neighbouring village is often depleted of most of its more youthful members to aid in the distribution and committal of the tubers to the soil.

Soil and Position.

A deep, well-drained sandy loam, that will work freely and cleanly, except when very wet, appears to be an ideal soil for the purpose; though often the heaviest and earliest maturing crops are produced where sand very largely predominates, but in this much depends upon the season, especially the amounts of rainfall and sunshine that prevail.

The potato crop being early cleared from the ground a sowing of rape seed immediately follows, and in a few weeks a luxuriant covering of herbage ensues, which is in turn consumed by sheep or cattle. The remnant of this crop is turned under by the plough in autumn, accompanied generally by a liberal dressing of farmyard manure. The green crop referred to makes a change of crop, and adds very considerably to the fertility of the soil, as it is obvious, owing to the limited extent of land suited to the potato crop, and more particularly its position, a systematic rotation of cropping cannot be carried out; but by careful and [illegible] cultivation crops of tubers are produced year after year from the same soil with but little, if any, diminution of bulk or precocity. A site by the seashore is favoured, as here the late spring frosts are of less intensity than further inland, and it is at times astonishing how the tender [illegible] escapes damage in the open fields, [illegible] to every wind that blows, when in enclosed and well sheltered gardens scarcely a trace of what but a short time previously was a flourishing crop remains.

James Day.

Galloway House, Wigtownshire.

There is no better guide to the kitchen garden than Vegetables and Their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden and the successful culture [illegible] saladings, and herbs for home use. Price [illegible] post, in box, 5s. 6d., from W. H. and L. [illegible] 148 and 149, Aldersgate Street, London.

SOME NEW ROSES OF 1907—II.

As was pointed out in the previous paper, the varieties of roses which are the subject of these notes fall under three divisions, viz.: (1) those that the writer has grown himself, (2) those seen growing elsewhere, and (3) those seen only at the exhibitions. Having considered Division 1, let us now pass on to Divisions 2 and 3.

Division II.—Varieties Seen Growing.

Mrs. Aaron Ward, H.T. (Pernet Ducher).—Colour orange-yellow, reverse of petals paler. Very distinct. Flowers of medium size, full and globular, produced singly on short, erect growth. In form the flower has a tendency to irregularity after passing the bud stage. This variety has been much praised in some quarters, and possibly it may improve in the coming season. It is not large enough for an exhibition rose, where its colour would be most welcome, but it may be suitable for massing, in which form it was exhibited at the Franco-British Exhibition.

Mrs. Cutbush, Polyantha (Cutbush).—Colour bright cherry-red. Small rosette-shaped flowers on long foot-stalks, produced in clusters, each stem forming a large, elegant bunch. Growth free. An attractive variety, suitable for massing; late flowering.

Division III.—Varieties Seen at Exhibitions.

Goldfinch, multiflora (Paul and Son).—Colour golden yellow, like R. ecæ in the bud, the opening bloom shading to almost white. Flowers small, semi-double, produced in clusters. It appears to be very vigorous, and, if sufficiently free flowering, will be an acquisition in the class of summer-flowering pillar roses.

Hugo Roller, Tea (William Paul and Son). Colour quite distinct, somewhat difficult to describe, a lemon-yellow suffused and edged with pink. Flowers of medium size, full, pointed, and of fairly good form. Said to flower freely until late in autumn. Attractive examples of it were staged by the raisers at the Horticultural Hall late in July. A promising decorative tea.

Lady Faire, H.T. (Bentley).—A sport from Mrs. W. J. Grant. Colour bright blush. As seen at the Leicester Show in August, 1907, where it was finely staged by the introducer, it appeared to possess all the characteristics of the variety from which it is said to have sported, both in form and habit. An attractive, distinct rose. An almost identical sport has been sent out by Messrs. Lowe under the name of Joseph Lowe.

Mrs. Dudley Cross, Tea (William Paul and Son).—Colour pale yellow, suffused red. Flowers of medium size, pointed, fairly full, growth free and vigorous. A decorative variety.

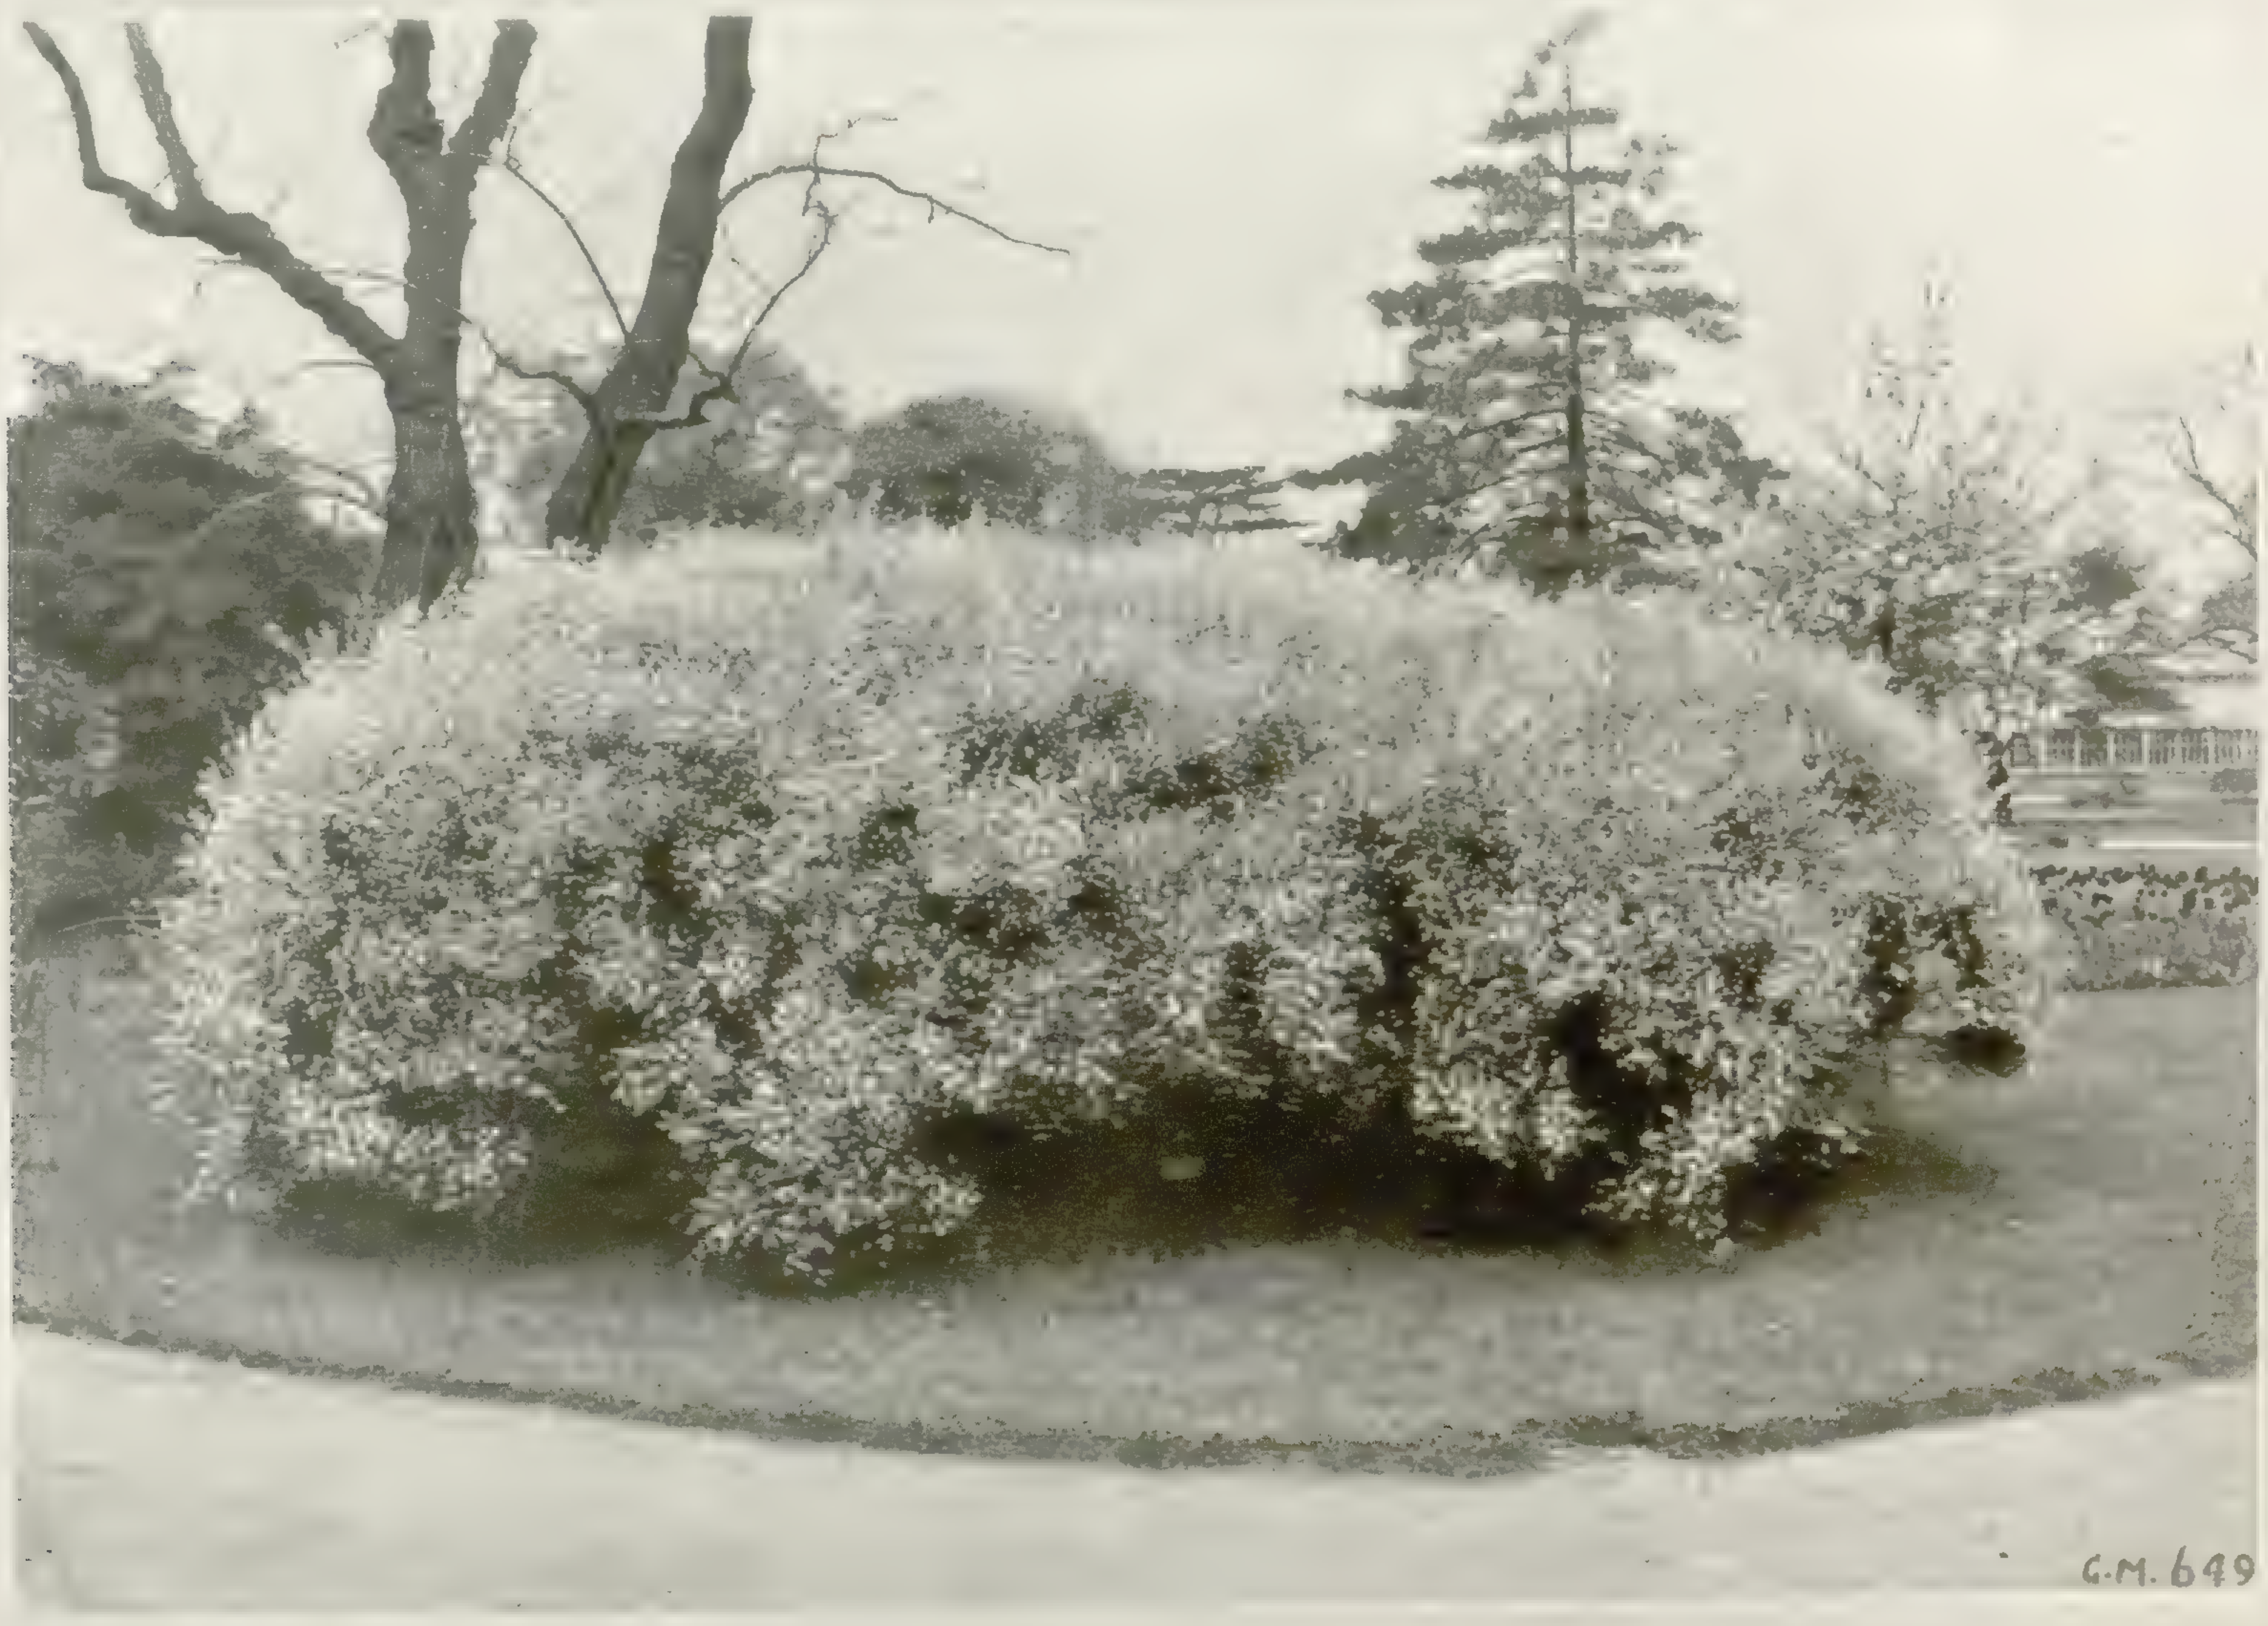
Mrs. Stewart Clark, H.T. (Hugh Dickson).—Colour bright pink. Flowers large, full, and of good form. Awarded gold medal of the N.R.S. A promising variety.

It will probably be found that the best roses in the lists given are W. E. Lippiatt, Harry Kirk, and Mrs. Cutbush. The first as an exhibition variety, and the other two as excellent for the garden and decorative effect. As to the Continental novelties, at present they are disappointing; they seem to be too thin, and wanting in form and distinctiveness. **Joseph H. Pemberton.**

Roses may be grown to perfection by following the instructions given in Roses and Their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

THE MOONLIGHT BROOM.

The most attractive of the brooms now at the command of the planter, if not particularly numerous, form a group of shrubs of much value for the ornamentation of the garden and pleasure grounds, and for the production of bold masses of colour in conspicuous positions in the park and on the margin of the home plantations. Of the several kinds, the Moonlight Broom (Cytisus præcox) has much to recommend it to the notice of planters. It is not superior to other of the finer kinds, but it is perfectly distinct from them all, and is highly attractive when grown under the conditions most favourable to flower production. It presents a pleasing appearance when planted in the shrubbery border in association with other subjects of moderate stature, and arranged in bold lawn groups, such as that herewith illustrated, it produces a striking effect when the slender growths are enwreathed with pale primrose-coloured flowers. Groups of this character are only suitable for large gardens; but small groups, consisting of three or four plants, are remarkably attractive and well suited for gardens of limited dimensions. Cytisus præcox is a hybrid obtained from a cross effected between the bright yellow C. purgans and the white Spanish Broom (C. albus), and has been in cultivation between thirty and forty years. Its hybrid origin is of considerable practical interest, inasmuch as it suggests that to raise plants identical in growth and colour of the flowers, increase of stock should be effected by means of cuttings. It commences to flower early in May, the exact date being determined by the season and district, and continues in bloom for about one month.



A LAWN GROUP OF THE MOONLIGHT BROOM (CYTISUS PRÆCOX) AT KEW.
A beautiful early-flowering hybrid with primrose-coloured flowers.

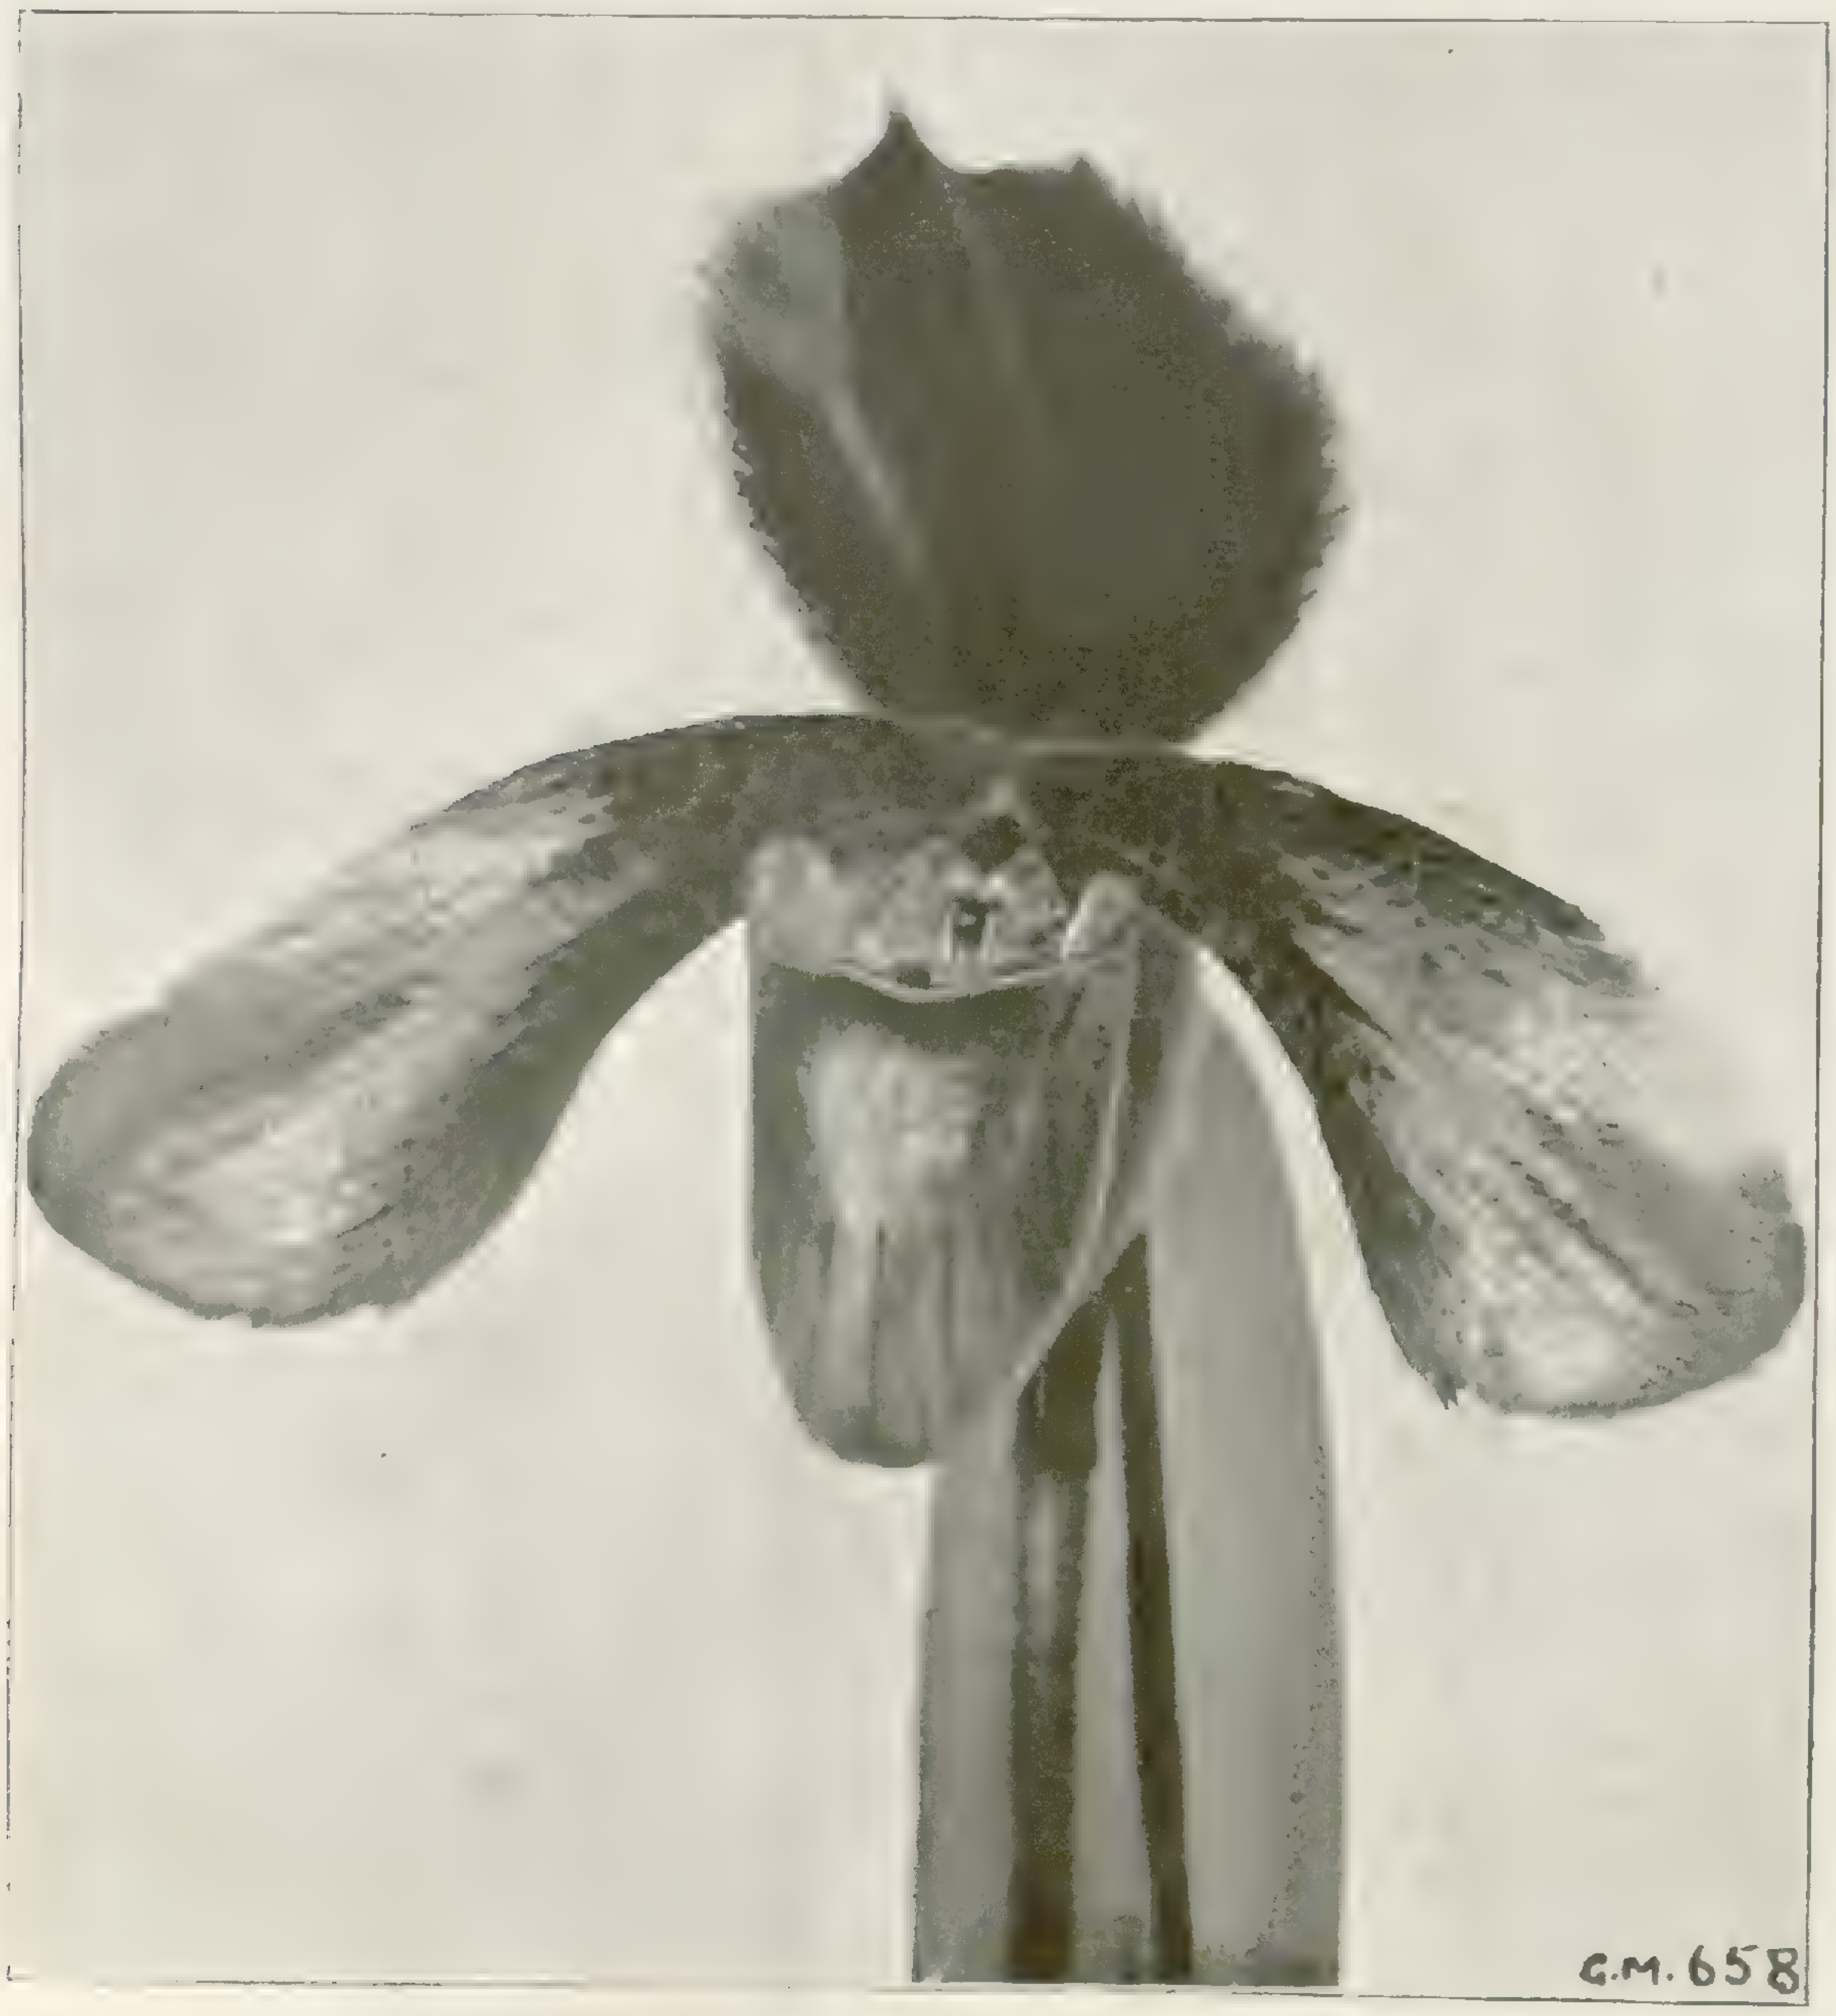
NEW PLANTS, ETC.

CYPRIPEDIUM BRIDGEI MAGNIFICUM.

The parents of this large and very distinctly coloured cypripedium are C. Godseffianum and C. Argus Moensi, and it is finer than the original hybrid both in form and colour. The dorsal sepal is dark purple with brown shading, and the broad, curved petals are of brighter purple with brown shading, the lip being green and purple. A.M., R.H.S., February 23. Mr. G. F. Moore, Chardwar, Bourton-on-the-Water.

CYPRIPEDIUM CURTE-MANNI.

This is a good orchid with an unfortunate name, that is meant to suggest the parentage, i.e., C. Mons. de Curte and C. Beckmanni; when it gets into commerce the hybrid will in all probability become C. Curtmanni, and the question will arise as to who was Mons. Curtmann. The new comer has a green, purple-spotted, white-margined dorsal petal, and very much waved petals that are brown and green, as also is the lip. A.M., R.H.S., February 23. Mr. G. F. Moore, Chardwar.



CYPRIPEDIUM BRIDGEI MAGNIFICUM.
Flowers green, purple, white, and rose. A.M., R.H.S., February 23. Mr. G. F. Moore, Chardwar, Bourton-on-the-Water.

LÆLIO-CATTLEYA PIZARRO WESTONBIRT VAR.

A very large-flowered hybrid derived from Lælia Jongheana and Cattleya aurea. The one bloom shown was rather flat, thus taking after the first named parent, and yet the petals were more or less waved. Petals and sepals are a bright shade of purplish mauve, and the broad, rounded lip is deep yellow with a pale purplish frilled margin. F.C.C., R.H.S., February 23. Lieut.-Colonel G. Holford.

CATTLEYA TRIANÆ MOOREANA.

A very beautiful variety of a fine old orchid. It is of fine form, and has very broad, light rose-purple petals, and narrower sepals, and a lip with an intense crimson-purple apex. F.C.C., R.H.S., February 23. Lieut.-Colonel G. Holford (grower, Mr. H. G. Alexander), Westonbirt, Tetbury.

FREESIA ROSE QUEEN.

A pretty new freesia with spikes of tubular rosy-pink flowers, that are white-throated, and sweetly fragrant. A useful addition. A.M., R.H.S., February 23. Messrs. Barr and Sons, Covent Garden.

ODONTIODA LUTETIA.

This is a beautiful new hybrid orchid, and its parents are Odontoglossum luteo-purpureum and Cochlioda Noetzliana. The flowers are of fair size and form, and very attractive. The ground-colour is yellowish, and on this are laid numerous brilliant orange-scarlet markings; the lip has a prominent golden crest. A handsome addition to our bigeneric hybrids. F.C.C., R.H.S., February 23. Messrs. Charlesworth and Co., Haywards Heath. (See figure on p. 159.)

ODONTOGLOSSUM KEIGHLEYENSIS.

A pretty orchid, with bright scarlet flowers, somewhat small and starry, borne on a branching spike. Odontoglossum cirrhosum and Cochlioda Noetzliana are the parents. A.M., R.H.S., February 23. Messrs. Charlesworth and Co., Haywards Heath.

CYCNOCHES PERUVIANA TRACEY'S VAR.

In this variety the curious and interesting flowers are borne in unusually dense spikes. The flowers are creamy-white, with purple-brown spots. A.M., R.H.S., February 23. Mr. H. A. Tracey, Twickenham.

CYMBIDIUM WOODHAMSIANUM ORCHIDHURST VAR.

This is a pretty orchid, derived from C. Lowianum, crossed with C. eburneo-Lowianum. The flowers are of good size and substance, greenish-white, with bright red-brown marks on the lip. The plant shown carried two fine spikes. A.M., R.H.S., February 23. Messrs. Armstrong and Brown, Tunbridge Wells.

DENDROBIUM LADY COLMAN.

A very handsome and large-flowered hybrid; one of the very best. Its parents are D. Artemis and D. Findlayanum. The sepals and petals are rose-pink, paling very much at the base. The big round lip is rosy, with a white rim around the fine central blotch of deep red-purple. A.M., R.H.S., February 23. Sir J. Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

DENDROBIUM ATRO-BRYMERIANUM.

Although not beautiful, this orchid was deemed worthy of an award by the R.H.S. Orchid Committee, because of its interest as being the result of a cross between such very distinct species as D. atro-violaceum and D. Brymerianum. The council altered the Award of Merit to a Certificate of Appreciation, this being the first time the new award has been made. The habit of the plant suggests both parents. The broad flowers are greenish, with purple shading and dots; the colouring and fringing of D. Brymerianum have been lost in the hybrid. C.A., February 23. Mr. R. G. Thwaites, Chessington, Streatham.

APPLE BARNACK BEAUTY.

A very useful late apple, roundish oval with a fleshy bulge close to the insertion of the stalk. Pale yellow, with red cheek on the sunny side. Flesh yellow. Of good quality, and a fine market apple. F.C.C., R.H.S., February 23. Mr. A. Poupart, Twickenham Green.

ERIA RHYNCHOSTYLOIDES.

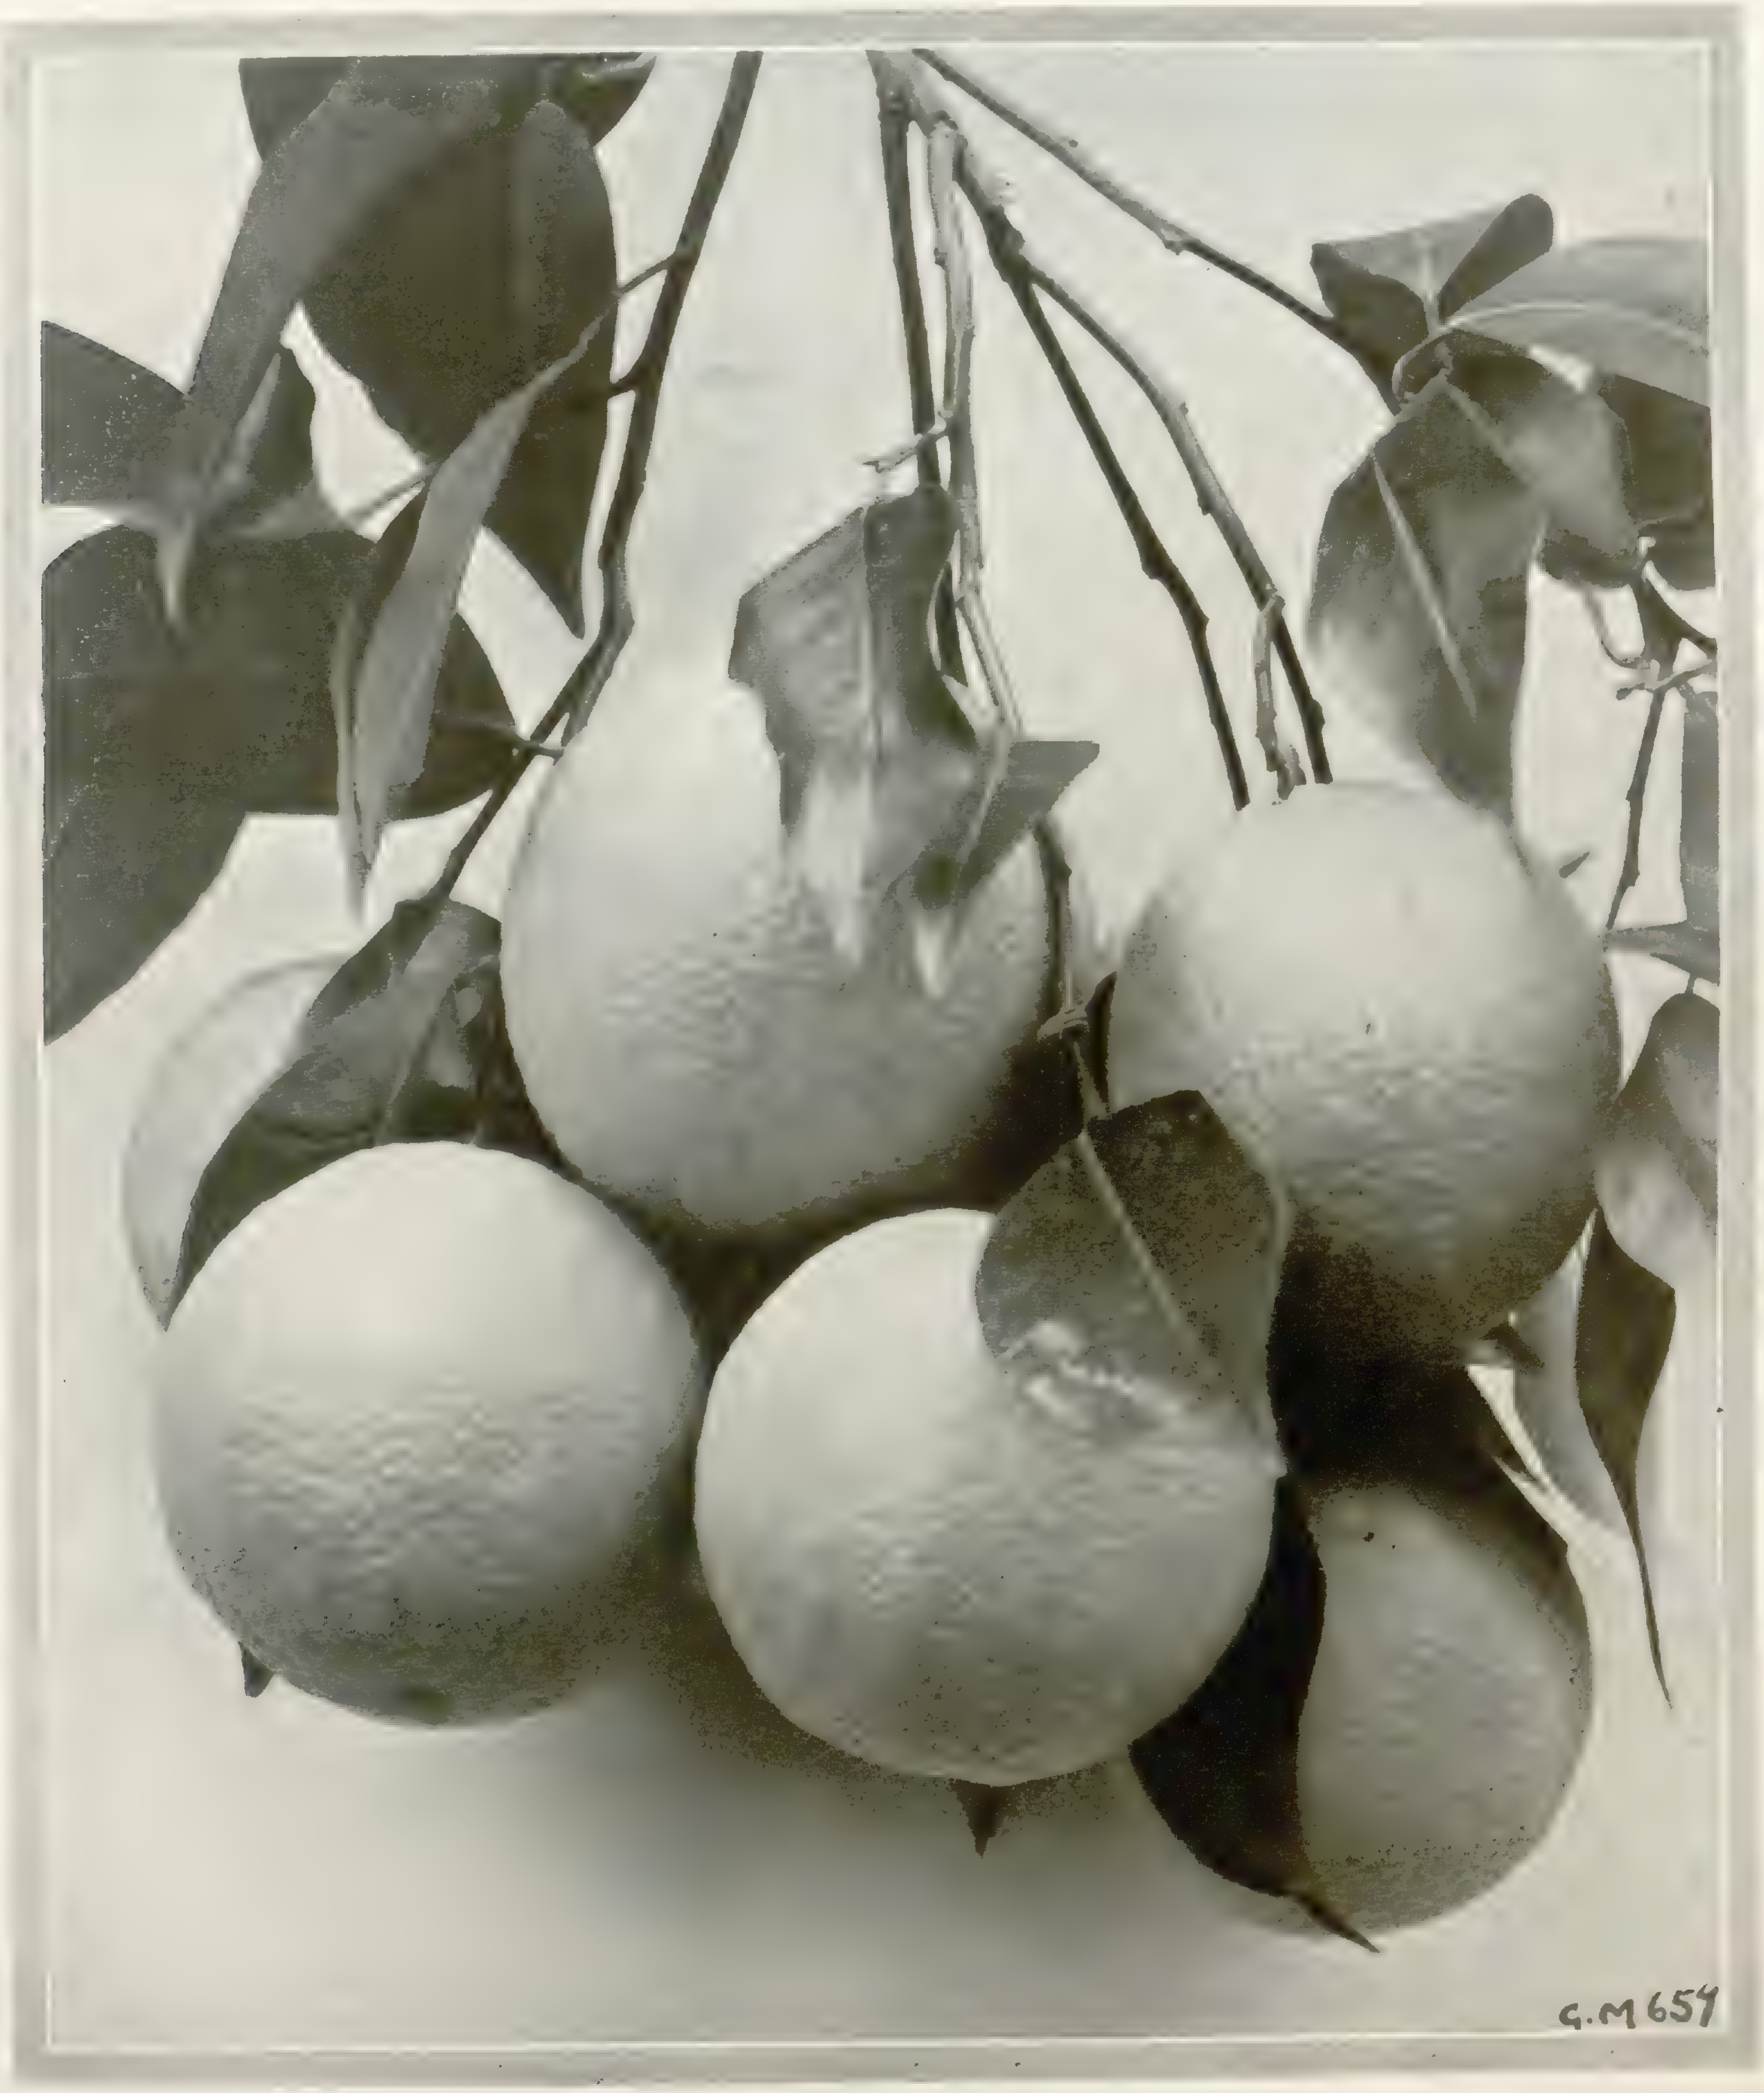
A Japanese species, and one that lends itself readily to cultivation in a warm orchid house. The tiny white and purple flowers are borne in large numbers on a dense curved spike about six inches long. Bot. Mag., t. 8,234.

Turnips.—Early turnips are given to prematurely running to seed, therefore, the best plan is to make small and frequent sowings. The first should be made in a warm and protected position. As the spring advances gradually select cooler quarters. The crop, too, is subject to attack from the turnip fly. As a means of prevention of this, and to assist growth, apply dustings of soot and light sprinklings of nitrate of soda when the young plants are nicely up. The variety Early Milan quickly bulbs, and is useful for the first sowing or two; afterwards [illegible] Snowball is more satisfactory.—C. F.

Ixoras.—The best time for taking cuttings is early in the spring, and preference should be given to the strong shoots [illegible] push from the base of the plants. In[illegible] them singly in small pots, in a compost [illegible] half peat and sand, or even in pure sand. [illegible] water them in and plunge in a bottom heat of from 75 to 80, and a night temperature [illegible] 75. Shift young plants, if not already done, into larger pots. Plants in vigorous health growing in 6 to 7-inch pots may be shifted into 10-inch pots. Pot them moderately [illegible] and use a compost of one part peat, two parts fibrous loam, and coarse sand. Water [illegible]fully until established, but make free and free use of the syringe. During the growing season keep the plants well up to the glass; give them a temperature ranging from 75 to 80 degrees. Amongst the best varieties are Ixora coccinea, I. Colei, I. W[illegible]liamsi, and I. Pilgrimi. Mealy bug and scale are partial to ixoras, and to keep them under unremitting attention is generally necessary. —William Fyfe.

ENGLISH ORANGE CULTURE.

There is a vast amount of difference between keeping large orange trees in presentable condition for conservatory or terrace decoration, and in growing oranges for the purpose of providing fruits of the highest quality. The tasteless pithy fruits the former trees yield are not to be mentioned in the same breath with those delicious examples given under good culture. Moreover, the difference between a ripe, well-grown English orange, and a good imported one is almost beyond description. The late Dr. Bonavia said the difference was as great as that between night and day. Anyhow, if the reader has not tasted a fully ripe English-grown fruit of St. Michael's, Brown's Orange, Sustain, or Navel varieties, he or she has no knowledge of the delicious flavour these possess.



A SEVEN-FRUITED CLUSTER OF ST. MICHAEL'S ORANGE.
Grown at Sawbridgeworth by Messrs. T. Rivers and Sons.

In these days when greenhouse construction and heating apparatus are so cheap, it is rather difficult to understand why so few have taken up the culture of oranges under glass seriously. Vast numbers of houses are devoted to peaches, but very few to oranges, and yet the latter yield freely, and the crop lasts over a much longer period than in the case of peaches, etc. The cost of production would be rather more for oranges than for peaches, not per fruit, but per size of house, because one could not leave the orangery unheated during the autumn and early winter. Some idea of the fruiting capacity of oranges trained loosely on wires, peach-tree fashion, in a span-roofed house, may be gathered from the fact that at Sawbridgeworth, Messrs. T. Rivers and Son could show, last week, a crop of 860 splendid fruits in a house 60ft. long, with a 4ft. border on either side of the 3ft. pathway. This is a very old house, planted experimentally many years ago, but it serves to show what could be done in a modern structure a little wider and with more headroom. Moreover, additional width would permit of the introduction of several dozen pot trees.

In such a house it would be a quite easy matter to obtain a thousand or more fruits each season, and the crop would last over a period of three months. Something must be said for the extreme beauty of a house full of oranges in fruit. The display at Sawbridgeworth, in the house referred to, was extremely beautiful, and one can imagine the delight with which a garden owner and lover would invite his friends from far and near to see a splendid display of this kind, just as he would delight to invite them to see his grapes or his chrysanthemums. Then, when the trees are flowering, there is an exquisite beauty and fragrance that no other fruiting tree can approach. Whether home-grown oranges would pay to market is doubtful, though it might do in a small way, because, one is thankful to say, there are always some folks able to appreciate and pay for the very best.

Equal parts of loam and leaf-soil, with some small charcoal added, and the whole made quite firm over good drainage, is all the orange asks for rooting in. If in a border, it needs an annual top-dressing, and the removal of inert surface soil; if in a pot, it needs potting about once in three years, and a top-dressing in the other years. A fairly even state of moisture is desirable at the roots, because drought and over-watering produce checks with oranges as with other plants. Feeding presents no difficulties simply because it is rarely necessary; soot water, and soapy water are both useful for occasional application, as they serve to keep the fine leaves deeply coloured, and also assist in brightening the colour of the fruits.

PERPETUAL CARNATION WINONA.
A fragrant salmon-pink variety of American origin.

You cannot carve a peach tree with impunity, and one has to deal very carefully with a vine or fig-tree, but the orange has not the slightest objection to the use of the knife. Cut hard back, it quickly starts into growth again, and practically every growth becomes a flowering and fruiting spray. As regards temperature the thermometer should not register less than 50 degrees during winter, with a rise to 65 degrees on bright days, when a little ventilation should be given near the hot-water pipes. When the crop has been gathered 45 to 50 degrees will suffice for a while, but 60 degrees at night and 70 degrees by day will be necessary when new growth commences, every advantage being then taken of the increasing sun-heat. Syringing is essential before and after flowering, but must cease during flowering and also when the fruits are colouring. Ventilation and damping down must be done in accordance with the range of outside temperature. No shading is ever necessary; indeed, the plants should not be trained right up to the ridge of the span, as their dark leaves would then exclude too much light.

From the foregoing remarks it would appear that orange culture under glass offers few difficulties. That is so. And yet there is one serious difficulty to overcome, and that is the one of keeping the plants clean. An annual cleaning of the house and plants, a free use of the syringe whenever permissible, frequent fumigation by evaporation of some nicotine compound, and an occasional examination of the trees, with sponge in hand, will keep insect pests and their attendant uncleanliness at bay. In short, the orange asks for no more attention than other fruits under glass, and in return it gives fruits of most delicious flavour, a veritable Garden of the Hesperides, a period of most delightful fragrance, and "Golden Apples" that will tempt the most fastidious Atalanta.

There are many varieties of oranges, but the best for the purpose suggested are St. Michael's, represented in the accompanying illustration by a seven-fruited cluster cut from the trained trees at Messrs. Rivers and Sons' nurseries; Sustain, Brown's Orange, Dom Louise, Bittencourt, White Orange, Silver, Washington Navel, and Blood Orange. The Jaffa is fine, but rather a shy bearer. It must also be pointed out that citrons, lemons, limes, and shaddocks may be grown side by side with the oranges. One feels quite certain that if owners of large gardens were to see the display and crop at the Sawbridgeworth nurseries, they would be so interested in and enchanted by it, that they would at once take up orange culture at home.

C.

PERPETUAL CARNATION WINONA.

The perpetual carnation Winona is one that is growing in favour with many of the lovers of winter flowers. We illustrate it herewith, and refer our readers to the excellent article on p. 162, by Mr. P. S. Hayward, wherein he refers to the variety as follows: Winona is another sterling acquisition from that expert American raiser, Mr. F. Dormer. In colour it is a taking salmon-pink, and will prove a strong rival to Mrs. H. Burnett. Winona is a very fragrant variety and with a good habit and pleasing formation, it should find a place in many collections.

THE WAYS OF THE BULLFINCH.

No one would willingly destroy this beautiful bird, but he is such a mischievous fellow that he cannot be tolerated, and the hand of every gardener is against him. He has chosen his spouse for the season now, and Mr. and Mrs. Bullfinch are on the warpath pecking the buds out of the currants and gooseberries, plums and pears, and if there is a shortage of this kind of food they turn their attention to the lilacs in the pleasure grounds. I do not mean to say that bullfinches are the only birds which destroy fruit buds, but I know of none that are so handy at the work, nor any that can do so much damage in so little time. Some well-meaning people would have us believe that the bullfinch is really a friend, and that he pecks out the buds for the sake of some insect there is inside them. We know our piping friend, or rather enemy, better than that, and are satisfied that it is a dainty morsel inside the bud that he is after, though a spirit of mischief may also to some extent account for his bad habits.

No one of late years has devised an original device for preventing the ravages of bullfinches, and we have to rely on the methods adopted by our grandsires. Perhaps small shot is the most effective remedy, not so much with the object of killing the birds as scaring them away until the buds have developed and there is no longer fear of damage. Wire netting round quarters of gooseberry and currant bushes, with wire netting over the top, is a well-known device, but everybody cannot employ it, and the next best thing is to make the buds distasteful to the birds. This can be done by syringing them with soapy water, and while the twigs are wet to dust them forcibly with soot and lime. This will also kill green moss and slime that sometimes infest bush fruits. Another remedy, also an old-time one, is that of webbing black thread over the bushes, and the fact of its long usage is evidence of its efficiency. But, after everything has been said about prevention and remedies, the fact remains that every spring season the piping bullfinch is a thorn in the side of the gardener.

H.

JAPANESE ART IN ENGLISH GARDENS.

As a striking contrast to the spread of Western ideas in Japan, one notes with the greatest interest the spread of Japanese ideas in our English gardens. One has not far to go to find out how deep an impression Japanese art has made in our English country gardens, for there are so many direct evidences of it. It is strange, certainly, that the Eastern nation, which has bowed itself to the incoming tide of Western ideas, and has grasped the main essential points of European progress in order to take its place in the ranks of progressive nations, should have silently and imperceptibly transferred to the West many of her own exquisite ideas in garden decoration. And it is these same delightful ideas which have assisted in the overthrow of the stolid formal garden.

In a subtle, mysterious way the mystic spell of the flowery land has been cast over our English gardens. We had not noticed its coming, although we had imported flowers and roots from Japan for many years; but all the same it is with us, and is moulding our own ideas of garden decoration on lines almost parallel with the land from whence it came. This spell has touched the quiet slumbering beauty of the old English garden, and with its fairy wand has transformed it into a living picture. All the magic and witchery of the East are apparent, and under its influence the English garden is entering upon halcyon days, and where we once had to look deep for beauty, lo, here we are confronted by it at every turn.

Can ought equal the iris gardens in Japan? Those glorious stretches of moisture-loving iris, which combine in themselves the most exquisite colourings under heaven, are already exercising their sway in this country. By the banks of pool and stream, margining the lakes, filling sunken beds upon the lawn, or growing in long sweeps of garden especially devoted to them, these magnificent iris are certainly a power in the land. The dainty tea house of Japan, clad with its wondrous covering of wistarias and vines, will certainly supersede the cumbrous artificiality of the English summer-house. There is a lightness in the tea-house of Japan, a daintiness of outline which harmonises with the garden proper. In itself it is a home of flowers, not like its English predecessor, a seeming "fowl-house in a garden." Everywhere the mystic influence is manifest, the graceful outline of bamboos, grouped in natural style, give a softness and exquisite touch of beauty to the landscape which never existed before.

Flowering trees, such as the cherry and many others, are ousting the funereal cypress, junipers, cedars, and other heavy evergreen trees which our fathers loved to plant. We may yet in our enthusiasm emulate the Japanese and have our feast days in accordance with the blossoming-time of our favourites. Certainly we are impelled to a strong love of flowering trees.

In the lilies of Japan we have another important factor in the English garden. Those lilies: auratum, magnificum, elegans, odorum, concolor, tigrinum, speciosum, yea, a whole host of them, call them what you will, but recognise in them the proof of the Japanese invasion. A long series of magnificent beauties, adapting themselves to the English garden as though they were native born. Surely never an army of invaders have had such a warm welcome before? A further look around reveals Japanese pæonies in immense numbers, Japanese roses, Japanese chrysanthemums, Japanese primulas, and hosts of other favourites of the Flowery Land all in keeping with their surroundings.

To go a step further, one notes the rapid strides made upon Japanese lines in the flower-clad pools. Lily pools, upon which rest the soft-hued water-lilies are already a feature in many gardens. What is more, the Japanese ideal in stonework for garden decoration is gradually displacing the appalling statues, vases, urns, and other incongruities which we received as a heirloom from the past. Japanese art in stone exists for an avowed purpose, and whether it is those interesting old stone seats, or those exquisite stone bridges, or, what perhaps will be more popular than either, those charming old stone lanterns, which at nightfall shed their diffused rays over rippling pools and waving irises, one realises the harmonious association they have with the garden scene. A harmony which entirely justifies their existence.

Certainly the outcome of this blending of East with West, will make for daintiness and simplicity in the garden, and furthermore it has considerably widened the scope of the landscape gardener. With such characteristically beautiful phases of garden decoration, it is not to be wondered that the garden-maker's art is being lifted to a higher plane than ever before.

We are on the upward grade, and though the idea in some quarters is to copy existing gardens, yet there is a widespread desire to give the country garden a complete living individuality of its own. In this manner the garden, complete and harmonious in its design and execution, will differ from its fellows. In this lies the interest and charm of the garden, and a combination of natural decoration and daring contrast should result in a phase of beauty which, initiated by the requirements of the one garden, it would be folly to endeavour to repeat in full in another.

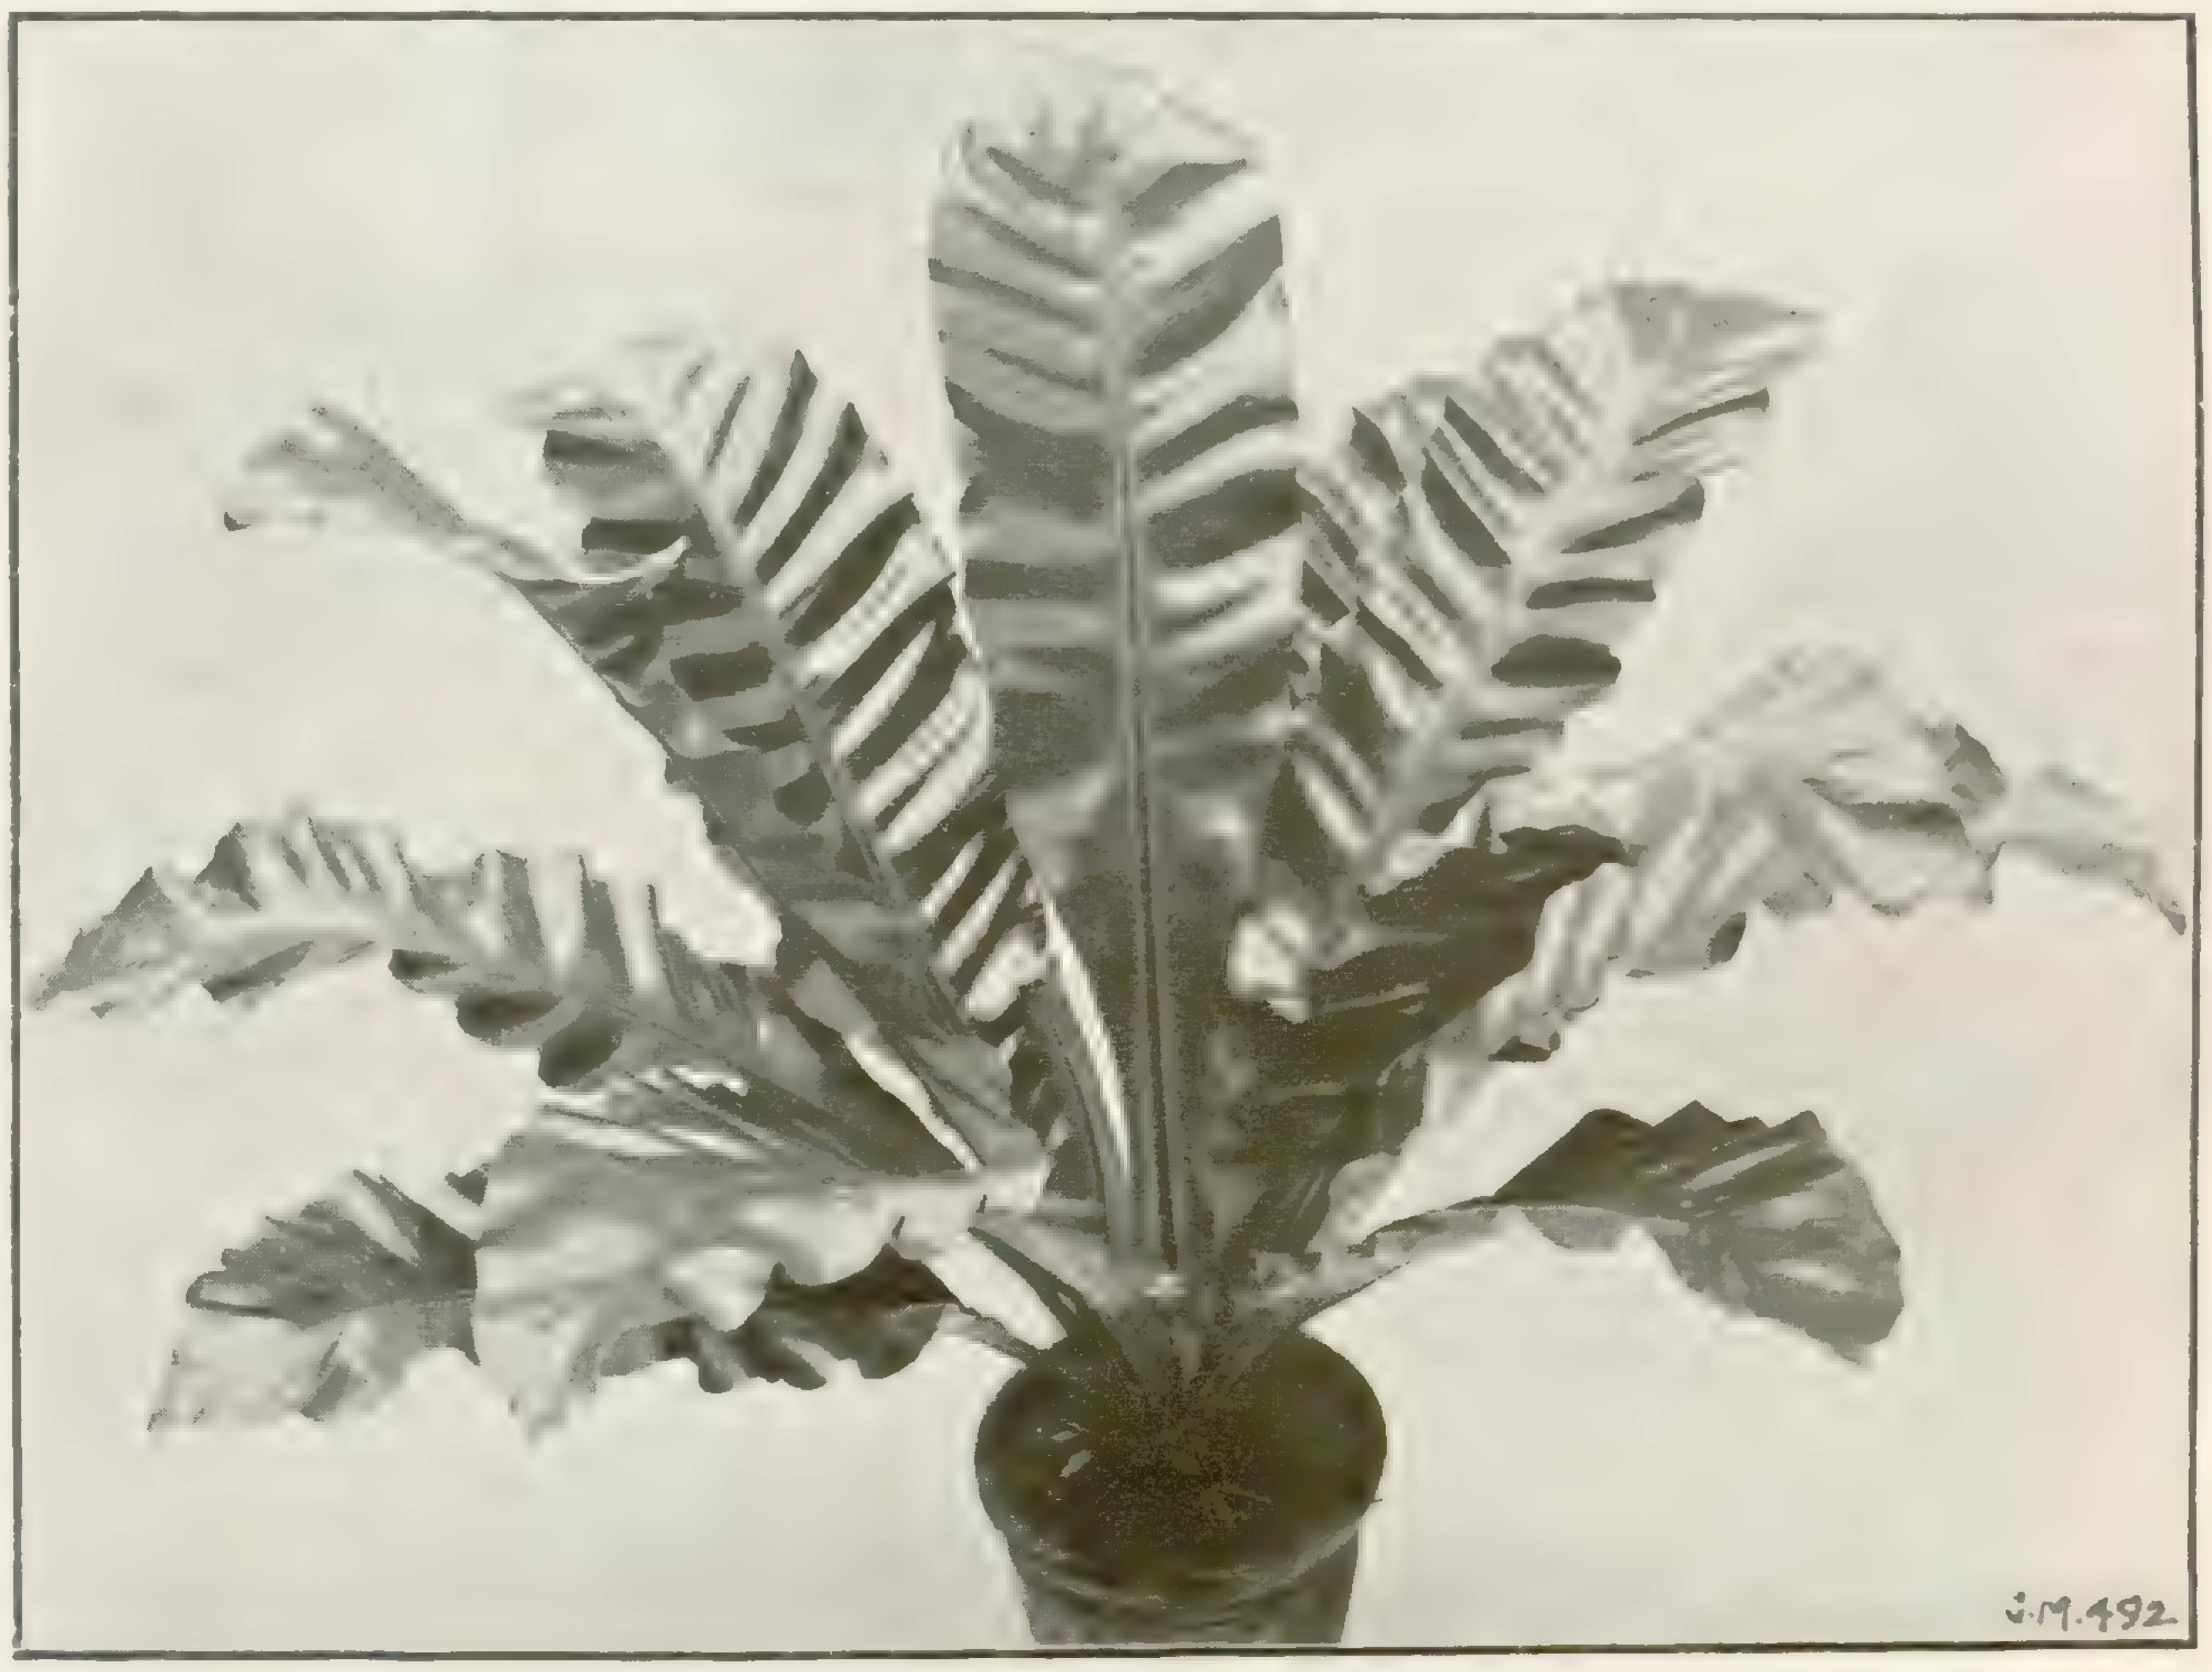
P. S. Hayward.

THE BIRD'S NEST FERN.

One of the boldest and most distinct of all ferns, and one that it is hardly possible to mistake for any other species, is the handsome Bird's Nest Fern, Asplenium nidus. The species has a wonderfully wide distribution, being found in the Mauritius, Seychelle Islands, Japan, India, Burmah, Assam, the Society Islands, Queensland, Norfolk Island, and Lord Howe's Island. The species is not markedly variable. In any large number of plants slight differences will be apparent, but of really distinct varieties there are few, the principal being A. n. australasicum, with rounded fronds and a keeled midrib; and A. n. musæfolium, with very large, rather upright fronds, that are elliptic in outline.

Although the bird's nest fern and its varieties will succeed under warm greenhouse treatment, it is as stove plants that they thrive best, but, as is the case with not a few other stove plants, they require little artificial heat during the summer, and may be placed out of doors then, in a sheltered and shaded position. In the production of sub-tropical effects Asplenium nidus is very useful. These ferns do not need a large amount of root room, because nourishment is very freely obtained by the roots that appear at the base of the fronds, and on the stem-like stock of the plant. The roots will also soon make their way out over the pot and attach themselves to its sides, so that moisture is more necessary than an abundance of soil. A suitable compost consists of fibrous peat and chopped sphagnum in equal parts, with a little sand added. Slugs and woodlice are persistent enemies, and will quickly spoil young fronds if they have the chance.

In 1906 a fern closely resembling A. nidus was exhibited; it had the fronds divided freely right down to the midrib into irregular segments. It was named A. n. laceratum, but some doubt has been thrown upon its relationship with A. nidus, several fanciers regarding it as a distinct species. The accompanying figure repre-



A FINE BIRD'S NEST FERN.
Grown by Messrs. J. Hill and Son, Edmonton.

sents a fine plant of a good type of Asplenium nidus, one of the many splendid plants exhibited not long since at Westminster by Messrs. J. Hill and Son, Barrowfield Nursery, Edmonton, who also showed the lacerated form just referred to, and obtained for it a First Class Certificate from the Royal Horticultural Society.

PANSIES FOR COLOUR EFFECT.

The pansy can be regarded in many different ways—as an exhibition flower of great worth, a spring bedding plant, a decorator of borders and window boxes in shade, and a lovely blossom for vases; but perhaps its chief merit is its suitability for creating vast stretches of colour in cold places away from midday sunshine. There are few of the lesser plants willing to thrive under these circumstances, and yet capable of imparting warm hues to the scene; on a higher level we may possess phloxes, but for a carpet pansies are unrivalled.

> "See, how a breadth of purple spreads
> Across the earth,
> Made up of myriad nodding heads
> Just sprung to birth.
> Mauve verges soft in rose and cream,
> White flushes into blue;
> And gold is splendid as a dream,
> For pansies are on view."

The garden landscape thus described is bound to be a fair one, and all the more valued because it may exist in the less favoured portions of the pleasure grounds. Pansy planting on a large scale can be well done in February, the weather being open. A regular plan should be pursued in order to gain the finest effect from the plants; thus, mixed varieties should only be used when they are of almost identical tints; a selection of pansies of gold generally proves satisfactory, so, too, with whites, but purples, blues, mauves, and even crimsons cannot be indiscriminately mingled without risk, as their shades clash so often.

A rarely beautiful effect may be created by covering the whole of a large bank, on the north, east, or north-west, or north-east sides, with this flower; a western aspect is also a good one, and a sloped wide border will do almost as well as a bank. There should be no regular pattern planting, but a long stretch of purple may be followed by one of mauve, next to which crimson, followed closely by rosy shades will look well; the next space may be a mass of lilac, then can come cream, white, indigo blue, and paler blues, perhaps separated by mahogany-brown.

All these colours are at the command of the pansy enthusiast, whether he raises his own plants from seed, or buys them. If only a beginning can be made this early spring by raising in heat in February, an autumn bloom can generally be relied upon, and the following spring display will be grand indeed. Of course, the quickest method is to purchase the plants at the cheap rate by the hundred, or half-hundred.

As a summer addition to pansy displays calceolarias are admirable; there can be gaps left at yard intervals, and these filled up with a trio of gold or brown calceolarias in May, the former tone with either the lavender, blue, and violet, or the lilac, mauve, and purple, or the crimson pansies; the latter look best with cream, gold, white, lavender, or pale blue. Such a bankside gives a glorious show from a slight distance, and is sufficiently telling even across several lawns, etc.

Named fancy pansies that are of extra merit for giving pronounced colour effects are represented by those old familiar varieties, Mrs. William Watson, lemon-yellow and black; Miss Stirling, cream and mauve; and Crimson Marmion. Show pansies, having petals less covered by dark blotches, appear of more "self" hues, yet it is doubtful if anything can surpass the warm or golden tints that the fancies, when grown to giant size, are sure to yield.

When shrubs are to be associated with pansy displays the golden-foliaged should be placed only among the dark-hued, and green-foliaged among white, cream, pale blue, mauve, rose, or yellow.

Shrubbery glades can be made beautiful by pansy planting in sufficient quantity; among sheltering branches the flowers will be protected from too much sun scorching, and the roots will find the cool moisture they need.

It will be essential to make the soil thoroughly rich, and if possible stiff clayish loam should also be incorporated; after this preliminary care a weekly watering of complete nature, followed an hour or so later by an application of liquid manure, will keep the plants healthy through the dryest summer.

In shade, or semi-shade, pansies will blossom freely for eight or nine months of the year, provided that they are kept from seeding, and have their number of shoots reduced now and then. M. H.

EARLY VEGETABLES.

In many gardens broccoli and other winter green crops have suffered very much this season through the exceptional severe weather at the end of December. Here we have not a dozen broccoli alive in the whole plantation, all varieties having suffered alike, and the same may be said of the asparagus kale, and Brussels sprouts. The bright sunny days, accompanied by cold east winds and sharp frosty nights that we are experiencing, are putting an end to the other green vegetables that were left. Under such conditions the garden will be denuded of all green crops with the exception of a few turnip greens and spring cabbage.

Therefore, it will be necessary to make other provisions where a large establishment has to be regularly supplied. Not only will it be necessary to force an extra quantity of such vegetables as asparagus, French beans, and seakale, but an extra supply of early potatoes, carrots, and other forced vegetables will be needed. Potatoes that have been prepared in boxes with a view of being planted on early borders should be brought forward if possible by planting a portion of them in frames or pits. Where practicable a slight hotbed should be provided to give them a start, but as the days are now becoming longer and the sun has sufficient power to generate a gentle warmth in the frames, all that will be necessary to ensure an active growth will be to cover the glass at night by means of mats to ward off the frost. Such provision can also be made for bringing forward carrots of the quick-growing kinds, also early turnips and dwarf cauliflower.

Asparagus is easily forced, either on an ordinary hotbed or in heated pits, but at this season of the year it is far better to have permanent beds where frames can be put over them, as this saves a great waste of roots. By doing this, growth can be forwarded at least a month in advance of that in the open ground, especially if the beds are raised, so that fermenting material can be put round the frames to generate a gentle heat, and the glass covered at night so as to prevent the temperature from falling too low. Most people are partial to asparagus, especially that of home growth, not the dry, blanched sticks that one sees in the shops. Nice green, juicy heads are appreciated by most people. French beans require more heat to bring them to perfection, but seed sown now on a hotbed where a temperature of from 65 degrees to 70 degrees can be maintained, will give a supply in from eight to ten weeks. These things are, however, a luxury that can only be indulged in by those who have the means for their production.

Cauliflowers raised from seed that was sown in boxes during January should now be making headway, and if plants of these are put out on a slight hotbed and given the protection of glass they will soon make headway, and will turn in during the latter part of May. Carrots and turnips may also be brought forward in like manner. If a frame can be afforded for early peas, these sown early in February under glass may be transferred to them. If these are placed in a sunny position, and the lights covered at night in case of frost, the crop will be accelerated by at least a month, but it is useless to bring such things forward unless attention is paid to them in later stages.

Where a large establishment has to be supplied, it is not only the dining-room that requires consideration, but there are other branches of the establishment that need looking after, and as the winter green crops in many instances are almost a failure, such crops as spring cabbage and turnip greens ought to be encouraged as much as possible. It would be well to give these a dressing of nitrate of soda the first warm, showery day, but care must be taken in applying it, otherwise much injury may be done to the leaves. To be of the greatest benefit the fertiliser should be reduced to as fine a state as possible, and then be carefully sprinkled over the surface between the rows. The rains and moist weather will soon dissolve the small particles and carry the nutrient matter to the roots. A good breadth of spring cabbage should always be planted, for there is no vegetable more useful in early spring, and it is doubly valuable in a season like the present. Those who still have plants standing in the seed-bed would do well to plant some of them out if they are at all likely to be required later on. It will also be advisable to make a sowing of parsley under glass, for in many places after such a spell of ungenial weather there may be a shortage as the season advances. H. C. Prinsep

Buxted Park Gardens.

Ferns.—The present is a very suitable time to undertake the repotting of ferns, though where a constant supply of adiantums is required, either for cutting or conservatory decoration, it would not be prudent to deal with them all at once. A batch should be picked out, selecting those somewhat more forward in growth than the rest, and keep them in a fairly warm, moist house; these will provide either fronds or plants till the freshly-potted get over their check. If it is necessary to increase the stock of adiantums, and seedlings are not available, some of the plants may be split up quite small, and this allows for all the others to be shifted into a size larger pot, but for all ordinary purposes 32 size or 24 size pots are large enough, though, of course, good specimen ferns in 12in. pots look very fine. A mixture of loam, leaf-soil, peat, and [illegible] with some well-broken crocks and rubble, will suit practically all kinds of ferns, and they should be potted firmly, placing them in a house where they can have a minimum temperature of [illegible] degrees, keeping them moistened overhead until growth commences, when syringing should be discontinued.—T. Stevenson.

LATE WINTER APPLES.

The heavy shipments of Colonial apples would seem very much to discount the value of late stocks of English fruit, indeed, there is a feeling abroad that not only late, but midwinter kinds also have suffered a setback. When such beautifully coloured, well-graded, and high-flavoured fruit comes in such quantities in the midst of our apple season, it cannot do other than injure the British outlook, judged from a commercial standpoint. Fortunately, however, those who have gardens in which to cultivate will have no heartburnings in regard to the Colonial enterprise, for though praise and credit is readily given the fine red-cheeked fruit from over the seas, we can still stand by our own when the question of quality arises.

There is yet an opening for our own or any other country to produce apples better than our best-class Cox's Orange Pippins. The British Columbians, though of fine size, have toughened skins that cannot gain in the race for flavour over our own. It is unfortunate that Bess Pool as a garden tree is so shy, for in the true forms of this variety there is a fine rich quality resembling somewhat a Cox's. From a large, healthy, established standard we have recollections of heavy crops of highly esteemed fruits. It belongs to the late section in its season of flower, commonly called "wise apples," and for this reason bears very regular and heavy crops. Mannington's Pearmain is another useful garden bush sort, cropping regularly and freely, and it has yellow-toned, richly-flavoured flesh. It must be left late on the trees in order that it be maintained in a plump condition until its season comes round. King of Tompkins County is another favourite for late use. This not only has good table qualities, but fine appearance also. King's Acre Pippin, an apple of modern introduction, is destined to furnish another useful high-flavoured late fruit. We are partial also to Claygate Pearmain, for this has several sterling qualities among winter selections.

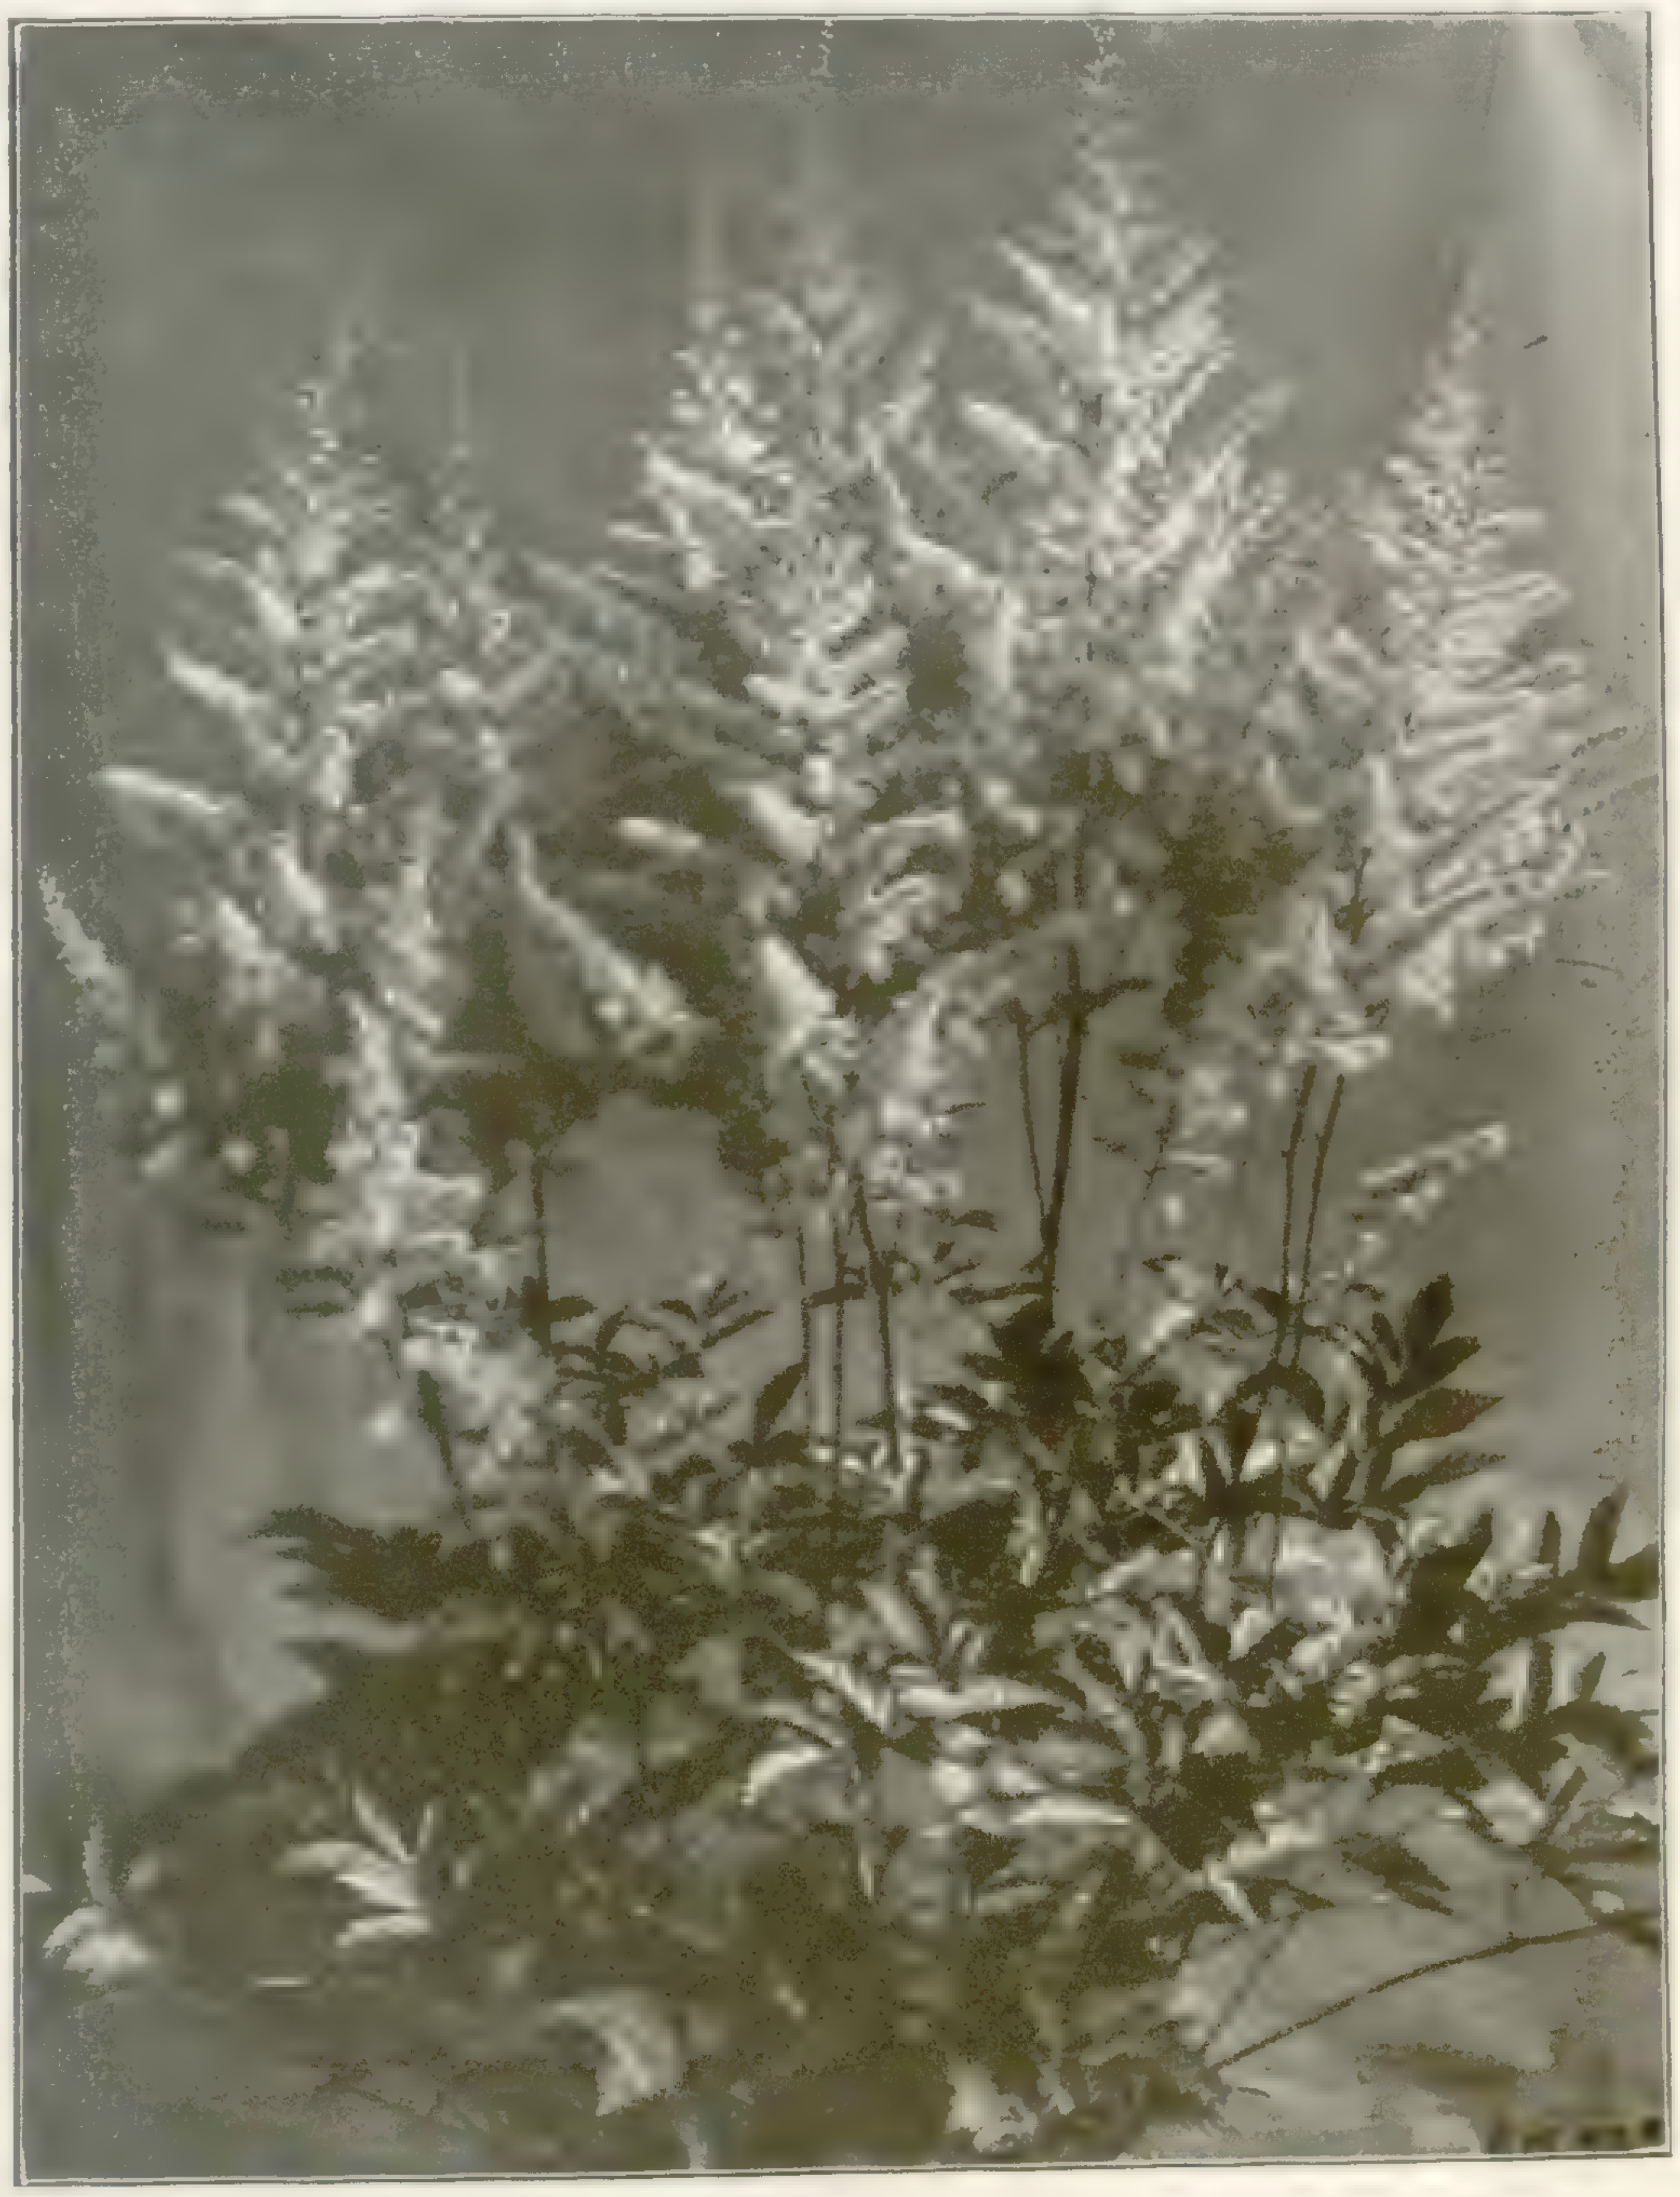
Lord Burghley and Sturmer Pippin both have many adherents, the latter certainly is valuable because of its prodigious bearing and its bright skin. It is valuable also because it will retain its freshness till so late in the spring. Lord Hindlip and Adams' Pearmain are other well-proved trees that will yet be retained in spite of Colonial ascendency. The old Cockle's Pippin possesses a crisp and sweet flavour which is much appreciated as a change from the yellow-fleshed apples. This has unusually pale flesh, which is one of its distinguishing features. With us it bears heavily every alternate year. Whether this is characteristic of the apple I am unable to say, possibly on the paradise stock it may be more regular. It will keep quite plump until March and retain its juicy crispness. Allen's Everlasting, Barnack Beauty, Hormead Pearmain, and Reinette du Canada are a quartette which claims the planter's attention when his bent is late spring stocks. The last named must be left as long as it is safe to do so on the tree, for the inevitable shrinkage of the flesh will spoil the best sample if this rule is disregarded.

One might easily extend the list of late winter apples, but it is, after all, not so much a long list that is needed, as one that can be depended on both as regards crop, storing, and table quality. These attributes are combined in several of the varieties mentioned, which renders them trustworthy.

W. Strugnell.

PINK ASTILBES.

There can be no question as to the beauty and value of the new pink flowered astilbes, and therefore we must accord all the more praise to Astilbe Davidi, the strong growing, deep coloured species that is so fine grown near water. The latter was one parent of the newest race of pink astilbes, and A. astilboides floribunda is the other. Several very beautiful forms of this hybrid were exhibited before the Royal Horticultural Society on July 21 last, and attracted a great deal of attention. The plants were all of sturdy growth, and said to be absolutely hardy. These crossbred plants, raised by Mr. Arends, of Ronsdorf, Germany, open up a fine prospect for planting in moist situations and in beds or borders for giving charming effects, for, with rare exceptions, all the herbaceous members of the spiraea group of plants are elegant and beautiful. Two varieties among the several that Mr. Arends has raised, stand out prominently by reason of their distinctness, vigour, and delightful colouring, and these are Astilbe Arendsi Ceres and A. Arendsi Pink Pearl. The former, of which there is an illustration herewith, grows about 2½ft. high., and produces graceful plumose spikes of deep rose-pink flowers. A. Arendsi Pink Pearl is soft, pearly pink, quite distinct, and equally beautiful, and the flowers open more slowly than in the case of the first-named variety, so that the flowering period is prolonged. To each of these two new astilbes the Royal Horticultural Society has granted an Award of Merit, and both are well worthy of inclusion in our gardens.



ASTILBE ARENDSI CERES.
Flowers deep rose-pink. Raised by Mr. Arends, Ronsdorf, Germany.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

General Remarks. — With the lengthening days and increased strength of the sun's rays, there will arise the necessity for providing more moisture in the atmosphere, but discretion is needed in increasing the amount at this season of the year. The changeable outside conditions, which of late years have been characteristic of our spring season, renders every caution necessary. No hard and fast rules can be laid down, therefore it is useless to advise that this or that division must be damped down two or three times a day. The grower must use his discretion. Situations also make a very considerable difference; naturally, in the neighbourhood of large towns and smoky manufacturing districts, where the sun's rays are more or less obscured, the drying conditions will not be so severe as under favourable situations. Under the latter conditions as long as we can keep up the temperature in the houses, damping may be done early in the morning from the present time onward, but even then the greatest care must be exercised during the prevalence of cold winds and frosty nights. Excess of atmospheric moisture during the prevalence of a low temperature is of no advantage to the plants, in fact I have not the slightest hesitation in saying that a considerable amount of the unsightly black spotting of the foliage is due to the effects of much moisture in the atmosphere during unfavourable outside conditions.

Shading.—Many houses with a southern aspect will now require shading during the hottest parts of the day. The blinds on all the houses should now be put in order for use at any time that they may be required.

Some classes of plants, such as odontoglossums, do not require a large amount of light, therefore sufficient shade is necessary at this season of the year to prevent loss of foliage through the ripening of the pseudobulbs. It is a very good plan where two sets of blinds can be used from the present time until the middle of April. All the shade that is absolutely necessary for these is something to break up the sun's rays, therefore a thinner material, with a larger mesh than that of the usual No. 5 greenhouse shading, may be used with advantage. The great disadvantage I find in lath roller blinds and thick shading material is that they obstruct more light than is absolutely necessary at the spring and fall of the year. I have no doubt others will have observed the sudden fall in temperature that takes place in houses where such blinds are let down over the glass. This necessitates the immediate closing of the ventilators, and this is one of the greatest possible dangers to plants, especially when their growth is in an early stage of development; nothing is more conducive to checks than a sudden fall in temperature, especially when it occurs when the atmosphere is heavily charged with moisture. A very considerable advantage is thus procurable from the use of thinner shading material.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

FERNS.—Now that the plants are dormant have them thoroughly cleaned of insect pests, and in the process of cleaning guard against their escaping by having some receptacle such as canvas underneath the plants. Should the fronds not yet have commenced to grow, fumigate two or three times in succession to clear the plants of thrips, the most difficult pest to clear. Now is a good time to pot, and the compost for the general collection of ferns should consist of two parts good yellow loam and two parts good peat, a little charcoal, and sufficient sharp sand to keep it porous and sweet. For such as gymnogrammas, make the compost fairly firm, which should consist of peat and plenty of sharp sand, with a portion of charcoal broken fairly fine. For gleichenias use shallow pots or pans, and give plenty of drainage, and, as in the case of davallias, assist the rhizomes to take root by pegging them down.

WHEN DIVIDING OLD PLANTS of Adiantum cuneatum, Pteris serrulata, etc., pull them to pieces for 4½ and 6-inch pots, in which they are so useful for decoration; keep the plants rather dry for a few days before the operation. The beautiful varieties of nephrolepis should not be overlooked for pots or baskets. Give attention to baskets containing adiantums, Woodwardia radicans, and Goniophlebium subauriculatum.

TREE FERNS, when repotted, should be kept fairly close for two or three weeks, and have their stems well syringed to encourage growth, maintain a day temperature of about 60 degrees. The method of increasing the popular varieties of ferns by means of spores is very interesting. Select fronds with spores of a dark brown colour, and, whether peat or loam is used to sow in, destroy all insect life by heat before using it. Press firmly, well water, and allow it to drain, then scatter the spores thinly, cover with glass, and put in the propagating pit or house until the seedlings are large enough to be pricked off into small pots.

ANTHURIUMS.—For stove decoration these are among the most useful plants when grown in 6in. or 8in. pots, for winter flowering. A. Andreanum is fine for filling vases, and is of easy culture when given good drainage, with farty peat and sphagnum moss in about equal parts, and a good proportion of sand for a rooting medium. Tall plants with bare stems will emit roots freely if a handful of sphagnum moss is placed tightly round under the leaves, and kept moist, and when roots have been freely made the top may be cut off and potted. Such kinds as A. Richardi and A. Scherzerianum are readily increased by divisions. The ornamental-leaved, including A. crystallinum, A. Veitchi, and A. Warocqueanum, with their large leaves, delight in a strong, moist heat, and a compost of turfy loam, peat, and sand, large pots, and good drainage.—Wm. Fyfe, Lockinge Gardeas.

FRUITS UNDER CLASS.

STRAWBERRIES.—The fruits should be thinned as early as possible after they are set, or as soon as can be seen which are swelling away. Six to eight fruits at this time are as many as the plants will bring to a high state of perfection. Supply the plants with some good liquid from the farmyard. A supply should be put in the house overnight, when it will be warm and fit for use in the morning. Syringe the plants well twice daily, and the house may be closed at 2 p.m. with sun heat. If the temperature rises to 75 deg. no harm will be done; but an average temperature of 60-65 should be maintained. To ensure a succession of ripe fruits, introduce batches about every ten days to follow up the earliest. Remove the loose soil from the surface, and see that the plants are free from slugs and worms. Top-dress and make firm, and wash the pots before putting them in the house.

EARLY VINES.—Attend to the tying down of the laterals, and exercise great care. The Black Hamburghs will soon be in bloom, and as soon as the flowers are thoroughly developed give the rods a sharp tap about midday, or agitate the air about the bunches with a fan in order that the pollen may be dispersed and fertilisation be effected. When several varieties are grown in the early house it is well to take a little of the pollen from the Black Harburgh and distribute it over the flowers of the shy setting varieties. Air must be given with caution, taking care not to admit east wind to the house at this stage, as much harm may soon be done. Maintain a temperature of 65 to 70 deg., with a rise of 5 deg. when the sun is shining brightly.

MUSCAT GRAPES may now be started into growth. These are best grown in a house that can be entirely devoted to them. If the border has been dealt with as recommended, the house may now be kept at a temperature ranging from 50 to 55 deg. Should the border be dry, give a thorough soaking of water at a temperature of 60 deg. I prefer inside borders for these grapes especially, as I have not found many roots travel outward, and one cannot be too careful in growing these, the most delicious grapes of all.

PEACHES AND NECTARINES.—The trees in the early house will now require disbudding, which should be done gradually, beginning at the top or uppermost branches. The operation should be extended over a week or more. Remove all laterals that point in an upward direction, and those that are under the branches. Leave to each shoot a growth as leader and one near the base, with as many as are necessary to fill up spaces. Thin the fruit moderately until it can be seen which are best placed and are swelling away, and then complete the thinning in a gradual manner. Fumigate immediately on the appearance of aphis. The temperature should now range from 60 to 65 deg. The trees in the second house will now be in bloom, and at midday the trellis should have a sharp tap to distribute the pollen and ensure a good "set." At this season I do not hesitate to spray the trees with a syringe and tepid water, and this I have always found to induce the young fruits to set freely. See that the borders are in a proper condition, and if at all dry give a good soaking. Trees in late houses should be kept cool and airy, as they will come along rapidly now, and what is wanted is to have them succeed each other in such manner as to avoid a gap.

FIGS.—These may now have an increase of temperature whether in pots or borders; about 55 degrees will suit them. See that the roots are well supplied with moisture, and syringe the wood twice daily, when the trees will make rapid progress. In planting figs do not give much border room, or growth will be so vigorous as to interfere with fruit production. The fig is best supplied with liquid nourishment, and a well-drained border is essential.—W. A. Cook, Leonardslee Gardens, Horsham.

THE KITCHEN GARDEN.

POTATOES.—Where cool frames are at command they may be made to serve a useful purpose at this season in safeguarding and forwarding early crops of potatoes on south borders to succeed those forced over hotbeds. Select nicely sprouted tubers, reducing any shoots down to the two or three strongest, and plant in quantity as likely to be required. The short-topped kidneys are very satisfactory for this form of planting. Sutton's May Queen, too, was a success with us last year. With these varieties, fifteen inches from row to row, and twelve inches apart in the row, will be sufficient room for the plants to develop. Also make a plantation in a sheltered border outside, where protection of some kind can be easily provided should spring frost make it necessary.

ONIONS.—Choose a fine day, and do not delay in sowing the main crop, if not already done. It is most essential that the ground should be in a dry condition. When preparing the seed bed apply a light dressing of soot and lime, and fork it in, afterwards treading and rolling the surface thoroughly to ensure its being firm and solid. The drills should be drawn out at one foot apart and about two inches deep. Sow the seed fairly thick to allow for a margin against loss of plants; moreover, the thinnings are mostly sought after for salad purposes. For general purposes, Bedfordshire Champion and James' Keeping are both very reliable.

AUTUMN-SOWN ONIONS.—These may also be planted out at once. Select a deeply dug and well-manured piece of ground, plant the onions with every care, and retain all roots possible. Fifteen inches from row to row will be necessary for these, and about twelve inches apart in the rows. If the soil is not fairly charged with moisture, give the plants a good watering to settle them after planting.

CARROTS.—Make a good sowing of the French Short Horn carrot in a light, warm soil and situation. This crop will be found very serviceable in yielding a supply of tender roots over a long period. Draw out the drills at about fifteen inches apart and two inches deep. Sow the seed rather thickly to provide plentiful daily thinnings when the young roots reach a usable size.

PEAS.—From now till midsummer make fortnightly sowings of peas. The distance from row to row may be decided by the height of the variety grown, always bearing in mind that no crop pays better for ample light, and thoroughly deeply stirred ground. Many prefer prepared trenches for sowings after May is in. There are so many excellent varieties to select from that it is of little advantage to recommend any one as being the best. For second sowings and onwards The Duke of Albany, and the different varieties of marrowfat peas give most satisfaction on the table. Harden off the plants that have been raised in pots under glass, with a view of planting them out as soon as the weather is genial enough.

GENERAL REMARKS.—Remove the stems of winter greens from the quarters as soon as the crop is used, as they are great robbers of the soil; and make every effort to manure and trench the ground before the frosts have gone. Should such a position be a suitable one for celery, the trenches are much easier and better made at this time than later, when the soil is less moist, and they afford most excellent sites for quick growing crops, such as lettuce and other salad plants. Make sowings of leeks, Brussels sprouts, cabbage, radishes, etc., outside as they are likely to be in demand. The kitchen garden from now onwards ought to present a neat and orderly appearance. When the heavy wheeling is completed, see that the pathe and edgings are put right, and if necessary, the gravel turned, or fresh added.—Charles Flack, Cholmondeley Castle Gardens.

NOTES OF OBSERVATION.

◆

Filberts and Cobnuts.—All young suckers should be carefully removed from around the stems, and the surface soil, so far as the roots extend, be pricked over lightly with a garden fork, removing at the same time any rubbish or weeds, and unless the trees are growing in very rich soil, a good mulching of manure spread evenly over the surface will be found beneficial. The nuts are produced on the upper portions of the young wood, also on short twigs and spurs. Pruning can therefore be carried out more successfully at the time when the crimson styles of the female flowers are most easily discerned, which is generally at the end of February and early in March, according to the season. When pruning it is essential that branches bearing plenty of catkins be left to ensure fertilisation. In many instances the bushes are allowed to grow in a natural manner, and where this is so some of the older branches should be cut out each season to prevent overcrowding.—G. W.

The Shortage of Greenstuff.—Those people who are dependent on the greengrocer for their vegetables have no need to be told that greenstuff is scarce just now, because they find it out by the price they have to pay for the commodity, and the difficulty they have in obtaining a regular supply. So scarce, indeed, is greenstuff that the greengrocer has to fall back on the farmer, and bargain with him for the green tops of the turnips growing in his fields. The other day we heard a farmer congratulating himself on having just sold ten acres of turnip tops as greens, and he still had the roots for his sheep. The reason of it! Well, last summer was not very favourable for the development of winter greens, owing to the drought, and on account of the mild, open weather in the autumn the plants never became properly hardened. It is true we have had no long spells of frost this winter, but the short, severe pinches have been too much for the tender sappy greenstuff, and the result is scarcity. Broccoli has wintered badly in most places, and there will be a big demand for spring cabbage when it begins to come in.—H.

Outdoor Vines.—These should have the lateral shoots pruned back to a couple of eyes, and the main leaders, if not required for extension, treated in the same manner. Reserve and nail in any of the young canes which are wanted to eventually replace any wornout branches; shorten the young canes back to well-ripened wood, training them to the old rod they are meant to replace, and remove the spurs from the old rod as far as the young one extends. Spray with a safe insecticide, examine the border, remove the loose surface soil, and top dress with some good loam, in which has been incorporated some wood ashes, and some finely broken up old mortar rubble, finishing off with a dressing of some good farm manure. Sometimes when vines are pruned late bleeding will take place, and to prevent this apply a little painter's knotting to each cut when pruning.—George Woodgate.

Daphne Blagyana is one of the daintiest and most reliable of dwarf shrubs which flower in the early days of spring. It scarcely, however, merits the title of shrub, as in practice the plant is only maintained in vigorous health by suppressing the branches level with the soil. Some growers effect this by means of stones, but I have found pegging the shoots is equally effective, and the best results follow if the stems are tongued or notched, and buried up to the foliage in the soil. It is often sent out as a grafted plant, which is unfortunate, as the species succeeds admirably upon its own roots. Daphne Blagyana grows freely in soil composed of peat and loam in equal parts, but it is unable to make headway in soil where lime is present, and I find it does well with a fair amount of shade. The flowers are produced in terminal clustered heads, and are of a soft cream colour, sweetly scented. —Thomas Smith.

Crocus banaticus.—A very distinct and handsome spring-flowering crocus is that named Crocus banaticus, the Banat crocus, although much more widely spread than its name would indicate. It is one which is more frequently quoted in catalogues than should be, seeing that some vendors do not possess the true species, but will substitute for it a purple variety of Crocus vernus. When the true plant is obtained, however, we possess a very handsome crocus indeed. It is of a warm purple colour, and each of the outer segments is prettily marked with a deeper shade of the same colour. The inner segments of the flower are lighter than the outer, and vary from nearly white to a pale purple, and are often striped or variegated with purple. The segments are comparatively short, and show the orange-yellow stigmata well above the flower. This handsome crocus is scarce in cultivation, but should not be so, as it occupies, in a wild state, a considerable area in Transylvania and the surrounding regions.—S. Arnott.

Garrya elliptica.—A fine specimen of Garrya elliptica, when seen in full flower during the early days of the year, may be counted one of the best garden pictures of the year, and because we have so few flowering shrubs at this season, it is well to keep this old favourite in remembrance when planting. It succeeds in the open in this district, but the richest display is produced by plants trained upon a wall, the catkin flowers, when fully open, form a cascade of creamy-white from top to bottom. The boughs are often employed as greenery to other flowers, and where large vases have to be filled a pretty effect may be obtained by mixing the Garrya shoots with the yellow sprays of Jasmine nudiflorum. When pruning is considered necessary with the garrya it should be performed as soon as the flowers begin to fade, so that a long growing season may follow, in which the shoots may attain maturity, and so flower freely the following spring.—Thomas Smith, Louth.

RED OR GRIZZLY GRAPES.

I would ask Mr. Pearson why, if Grizzly Frontignan grape is so valuable, it is not more grown? Can he give me a single instance of its inclusion in a vinery, and furnish name and address of grower? Surely Madresfield Court and Muscat of Alexandria are widely grown because they are worthy of attention in every way, and, if this is true, the opposite reason in relation to Grizzly Frontignan is a strong argument against its value. What an argument to advance in favour of grizzly grapes, to say that the employer usually prefers grapes that will make a show on the table! Surely few would advise a guest to try a grape if he knew it was no good in point of flavour.

Does Mr. Pearson wish us to believe that employers take so little interest in their fruit houses that they do not know of the existence of such a grape in their vineries? And would he also have us believe that the gardener's influence with his employer is of such small moment that he cannot persuade him to taste this much-belauded grape before placing it on the table for his guests? Really, the notion is much too absurd, and shows how little Mr. Pearson understands the relations of employers and gardeners.

I do not object to red or grizzly grapes because they might seem to be a "glaring proclamation of incompetence," but I object to them because they are worthless as compared to Madresfield Court or Muscat of Alexandria, and consider it waste of time to grow them, as apparently do most growers. If Mr. Pearson's head does not ache until either the Wisley experiments, or others, have made grizzly grapes to be preferred to Madresfield Court or Prince of Wales (leaving out that universal favourite Muscat of Alexandria), I guarantee him a long immunity from that distressing ailment. E. Molyneux.

Swanmore Park.

SWEET PEA JOTTINGS.

A week ago we were experiencing sharp frosts at night and bright sunshine by day. The thrush sang gaily, perched on the topmost branch of an ancient Catillac pear tree, and the ground trenched up for sweet peas was crumbling down beautifully. Spring was in the air, but now, March 3, the outlook is white, there is no brown earth to be seen, and the thrush has ceased to sing. It is winter again. But the snow will do no harm, nay, it will do much good, and if a good steady rain would come to wash it into the soil, that would further improve matters.

In suburban districts, or other places where it is no easy matter to obtain good brushy pea sticks, inquiries for these supports are generally left too late. There is usually someone who knows where to obtain good sticks, but the demand is so small and irregular that he does not lay in a stock. May I suggest that where there are little colonies of sweet pea lovers these should combine to secure the necessary sticks direct from the woodman, or through a dealer. It is a better method than that of leaving the matter late, and to chance.

Sweet peas are germinating magnificently this year; at least, that is my experience, and I have sown many varieties, from many firms, and from several countries. There is practically no difference in germination this year between Californian and English and German seed, and, if others have the same experience as I have, there will be little, if any, grumbling about faulty germination this season. It is wonderful how readily sweet pea seeds respond to genial warmth. In a temperature of about 50 degrees by night, rising perhaps 20 degrees by day during bright sunshine, germination is very rapid. In many cases the growing points of the young seedlings have come clear through the half-inch covering of soil in seven days from the time of sowing.

Where a moderate amount of heat is used to secure germination the chief difficulty is that of hardening off the young seedlings, and giving them cooler quarters before they become drawn and weak. If one has a frame heated by means of hot water the difficulty is easily overcome, because the heat can be readily adjusted, and ventilation provided so as to secure a sturdy growth and prevent a severe check.

The new catalogue of sweet pea names will soon be ready, and every new member of the National Sweet Pea Society will, as already announced, receive a copy free. Old members, who had a catalogue in the "Sweet Pea Annual" of 1908, and non-members, may purchase copies for 6d., post free. It is an interesting list, compiled by Miss Jessie Cuthbertson, and it is now no secret that this young lady is to receive a Gold Medal from the N.S.P.S. in recognition of her work on the catalogue.

The Woodbridge Horticultural Society has taken up sweet peas in a very whole-hearted way in recent years. Last year one whole tent was devoted to the popular annual. Mr. J. Andrews sends me a note to the effect that a new class has been provided for the show of July 14 next, and it is "for nine bunches of sweet peas, nine spikes to the bunch, correctly named, own foliage, any seed; space allowed, 3ft. 6in. by 3ft. The class is open only to amateurs and gardeners." The first prize is the 25-guinea Woodbridge Hunt Steeplechase Challenge Trophy, and a gold medal engraved with the holder's name, and date of winning. The trophy will, of course, only be held from year to year. The second prize is a handsome 400 day clock, and the other prizes are 10s. and 5s. respectively.

Chas. H. Curtis.

WOLVERHAMPTON.
GREAT FLORAL FETE,
July 13, 14, and 15, 1909.

Special Features for the Coming of Age Show.
£900 IN PRIZES.

Prize Schedules on application to the Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, February 23. Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair), Sir J. T. D. Llewelyn, Dr. A. B. Rendle, Rev. W. Wilks, Messrs. J. L. Arkwright, J. W. Odell, W. Hales, R. H. Pearson, A. Worsley, E. M. Holmes, W. Fawcett, F. J. Baker, A. W. Sutton, R. A. Rolfe, G. S. Saunders, J. T. Bennett-Poë, W. Cuthbertson, G. Massee, and F. J. Chittenden (hon. secretary).

DISEASED PARSNIPS.—A report was received from Mr. Güssow concerning the parsnips with scabby spots shown at the last meeting, from Mr. Gregory, stating that they were attacked by the fungus Plasmopara nivea, which appears first on the leaves and attacks also carrots and parsley.

MALFORMATIONS IN ORCHIDS.—Mr. Gurney Wilson, F.L.S., sent the apical portion of a pseudo-bulb of Dendrobium nobile bearing a shoot from which roots had grown as in a vegetative shoot, and a flower, the lateral petals of which were coloured like the labellum. He also sent a dimerous flower of D. nobile, with the lip suppressed and the two lateral sepals coherent; a cypripedium from Sir Jeremiah Colman having two dorsal sepals was also shown.

MENDELISM IN ORCHIDS.—Mr. R. A. Rolfe showed flowers, the result of crossing Epidendrum evectum and E. xanthinum. The former of these is purplish in colour, the latter yellow. The first cross gives E. kewense, and flowers of this were shown. Seedlings had been raised from E. kewense after self-fertilisation, and of these, one which flowered earlier, was practically a reproduction of E. kewense, while of two others (flowers of which were shown) one showed partial reversion toward the purple E. evectum, the other toward the yellow E. xanthinum. He also showed the result of recrossing E. kewense with the original parent E. evectum, the resulting plant having a purple flower not quite so dark as the parent, and said that E. kewense re-crossed with E. xanthinum gave a yellow flower. Other plants of the crosses were yet to flower.

COLOUR CHANGES IN CARROTS.—Dr. C. B. Plowright sent the following note concerning the colour changes occurring in carrots, together with illustrative specimens: The portion of a carrot sent is interesting as showing the condition common last year, viz., the longitudinal splitting of the root from the crown downwards, exposing the medullary portion, which shows no tendency to cleave. The exposed portion shows a tendency to development of chlorophyl. On the edges of the cortical portion no chlorophyl is seen, but minute specks, tending to become confluent, of a red colouring matter (carotin ?) have been freely developed. The specimen sent is of an ordinary garden carrot; the fissuring of the outer portion is thought to be due to dryness at the time of growth. In the smaller specimen different colour changes have taken place. The exterior has freely developed a green tint mottled with patches of purple. They have been exposed on the surface of the ground all winter. The purple is quite superficial. It is interesting to note that this brilliant change has taken place in the least coloured variety; for these small ones are, as a section shows, of the pale variety grown for cattle, and popularly known as "stock carrots." Incipient colours are often shown in the exposed roots of other plants, for example, blue discoloration, as beet root stocks are frequently mottled with blue stains when they are pulled and left exposed to the light and air.

POTATO TUBER DISEASED. — Mr. G. Massee showed a potato tuber having a black patch (dry scab) about 2in. square, the result of an attack of the fungus Stemphylium (Phellomyces) atrovirens. This disease has been very prevalent in Scotland this season, and considerable damage has been done to the crop. The present example came from Oxford. The spores are known to remain alive in the soil, and be capable of infecting potatoes for several years. Diseased tubers should therefore not be used for "seed," nor should potatoes be grown on the same land as that on which the diseased crop was grown.

APPLE CONTAINING GERMINATING SEED.—Mr. F. J. Baker showed an apple containing germinating seed, and made some remarks upon the result of allowing seed to dry thoroughly before sowing. He considered that seed of many plants which had been allowed to remain as long as possible within the fruit gave better results than seed removed early and kept.

VARIATION IN PRIMULA SINENSIS.—Mr. A. W. Sutton showed a number of plants of Primula sinensis having leaves of a shape approaching those of ivy. He said that occasionally such plants were observed, but they had not until last year set any seed. Seeds had, however, been obtained from three plants last year, and this had given a considerable number of plants with leaves of the form of the parents, and with petals of a very similar form, the form of the latter being apparently correlated with that of the former.

CINERARIAS DYING.—Mr. W. J. James sent a plant of cineraria, one of about 150 which had died out of some 3,000. It was found that the base of the plant had been attacked by the bulb mite, Rhizoglyphus echinopus, in great numbers, and that these had caused the death of the plant.

MISCELLANEOUS.—Mr. Bowles, on behalf of Mr. Hudson, showed the inflorescence of Hæmanthus sp. A diseased plant of Lapageria rosea was referred to Mr. Massee, who kindly undertook to report upon it. Some vegetable material, called by the sender, "vegetable asbestos," was referred to Mr. Holmes. Numerous diseased plants were received and reported upon.

Croydon Gardeners' Association.

At the recent fortnightly meeting of this society, a lecture and demonstration on table decorations were given by Mr. R. Edwards, Beechey Lees Gardens, Sevenoaks, who has before read excellent papers on cultural matters before this society; therefore he received a very hearty welcome, especially as he has been most successful as an exhibitor of floral decorations. To illustrate his remarks, he furnished a table with floral embellishments, which at once struck one as being light and very attractive. It comprised a centre epergne with four corner pieces, and was built up in such a manner that the guests could see each other from all parts of the table.

One of the first things to consider, he remarked, was the harmony of colour one must provide, and, although he did not adhere absolutely to only one or two colours being used, whatever flowers might be brought into requisition they must be of shades in harmony with each other. Another point to be remembered was to let the decoration agree with the season. He said it was not necessary to mention any particular flowers to be used, as we have so many at our disposal all of which can be made effective.

From a dinner table he passed on to other types of decorations in the home, and showed how the intermixing of pot plants with cut flowers can be made to give good effects, especially where broad expanses have to be covered. A few useful hints were given for artificial aid in arranging flowers. A piece of wire netting pressed together and laid in a bowl of water will be a valuable aid to hold flowers erect. When Iceland or Shirley poppies are used it is, he said, a good plan to put the cut stems in boiling water or just burn the ends with a lighted candle or match.

Where flowers are required to be preserved for several days the water should be changed daily, and a little sugar may be added with beneficial results. Flowers for travelling are best when cut the previous evening, when dry, and the stems immersed in water.

The subject brought forth a good discussion by the members, and Mr. Edwards generously replied to all questions. A very hearty vote of thanks was conveyed to him, and a like tribute was given to Mr. M. E. Mills, Coombe House Gardens, for an exhibit of cones from different species of conifers.

Dumfriesshire and Galloway Horticultural Society.

The annual general meeting of the Dumfriesshire and Galloway Horticultural Society, which was founded in 1812, was held in the Town Hall, Dumfries, on the evening of February 20, Provost Nicholson, Maxwelltown, occupying the chair. The treasurer's report was submitted by Mr. R. G. Mann, and showed a credit balance of £5 18s. 8d., a reduction of about £17 from the previous year, the total income being £252 6s. 4d., and the expenditure £246 6s. 4d. The drawings at the gate amounted to £108 10s. 8d. The report was adopted, on the motion of Mr. F. W. Malloch.

Before proceeding to the election of directors the opinions of the members present were asked regarding the propriety of continuing the show, and while the consensus seemed in favour of again holding the show, different views were expressed by the members, some holding that the sports were necessary to draw the public, and others advocating other features combined with the flower show, which, they suggested, should be held in the Drill Hall. It was ultimately agreed to ask the directors to discuss the question, and to report to a future meeting. As Provost Nicholson wished to retire from the chairmanship, it was resolved to ask Provost Lennox, Dumfries, to become the chairman for the year, and Messrs. R. A. Grigor, J. W. Haining, James Henderson, F. W. Malloch, C. Murray, James M'Leod, J. M. Stewart, and Taylor, were appointed directors. Mr. Mann, "Courier and Herald" Office, Dumfries, was reappointed secretary and treasurer.

Oxford Gardeners' Association.

Mr. Frank Harris, the chairman of this newly constituted association, presided over a large attendance at the recent monthly meeting, when Mr. A. G. Nicholls, of Strathfieldsaye, gave an instructive lecture on the cultivation of potatoes. The lecture was illustrated by lantern slides, which had been kindly lent by Messrs. Sutton and Sons.

In his opening remarks, Mr. Nicholls said that an ideal soil for potatoes was a good friable loam, rather light in texture and free from stagnant moisture. Such soil would produce heavy crops of good quality, while least satisfactory were those which naturally wet, close, and heavy. The situation should be open, free from overhanging trees and shrubs, and where the sun reach it throughout the day. The ground should be well manured and trenched in the autumn months, leaving the surface rough a state as possible for the pulverising agency of frost to act on it. In trenching, if the subsoil was of poor quality, his advice was not to bring it to the surface, well manure and thoroughly break leaving it to remain at the bottom. For soils he recommended well decomposed yard manure, while for heavy soils, surpassed good rotten oak and beech free from sticks and decayed refuse, scrapings from roads where flints were used, old mortar refuse or the refuse from a potting bench. By the operation of trenching superfluous water would drain away in winter, a greater root run was provided, and the soil would be warmer in the spring and allow of moisture rising by capillary attraction in summer. If the growers had to depend on home supplies for seed purposes, let them select sound, good-shaped tubers from three to four ounces in weight from a crop lying on the ground when lifted, and not, as was often done, from those packed in a heap and not suitable for culinary purposes. They should place them thinly in boxes or on shelves in some frost-proof place till early in January, when they should be set, eyes uppermost, in trays or shallow boxes, before any growth appeared and exposed to as much light as possible, at the same time guarding them against frost. By so doing, strong dwarf, dark green shoots at planting time would be obtained. He strongly advised the purchase of Scotch or Irish seed. They should be procured early and placed on their ends as soon as received. As soon as the strongest shoots were discernible they should be reduced to the two strongest, while if they were for exhibition purposes one should be left. These shoots should be removed with the point of a knife. Mr. Nicholls recommended May Queen as a first early, with Ninetyfold and Puritan to follow, Sir John Llewelyn, Windsor Castle, and Up-to-Date. For exhibition purposes he recommended Satisfaction or Windsor Castle (W.R.), Reading Russet or Herd Laddie (C.R.), Mr. Bresee or King Edward VII. (C.K.), Superlative or Up-to-Date (W.K.).

Bristol Gardeners' Association.

The usual fortnightly meeting was held on Thursday, February 25, at St. John's Parish Rooms. Mr. A. O. Shelton presided over a good attendance. A very instructive lecture upon "Barren Soils" was given by Mr. Arnold, gardener to Earl Bathurst, Cirencester House. The lecturer dealt very exhaustively with all kinds of soils, giving minute particulars as to the best methods of successfully working the various kinds. In shallow soils, with a strong or brashy subsoil, the lecturer said great difficulty would be experienced in keeping the crops growing, and in order to keep it fertile, a good layer of fat manure should be placed at the bottom when trenching, and there should be lavish top-dressing. Deep soil with gravel subsoil, is generally devoid of potash and lime; stable manure and wood ashes was recommended in this case. Deep loam, with clay subsoil, requires careful drainage; trenching is of the utmost importance, then vegetables will flourish in it. For heavy soil, with sandy subsoil, deep cultivation is necessary. For heavy clay, thoroughly drain, burn the surface to a depth of twelve inches, and add sand, grit, builders' rubbish, and lime; avoid nitrogenous manures on clay, but use basic slag freely. Keep the hoe working on all soils in hot, dry weather. These were the chief points.

A good discussion followed, and the best thanks of the meeting was extended to Mr. Arnold at its close. For two primulas, Mr. Grieve, gardener to G. A. Wills, Esq., was first; Mr. Jennings second; there was strong competition.

Cardiff Gardeners' Association.

At the fortnightly meeting of the above society, held on the 16th ult., at the St. John's Schools, Mr. H. R. Farmer presiding, Mr. H. A. Gerhold, Penarth, delivered a lecture on the "Cultivation of Sweet Peas."

The lecturer, in his introduction, made reference to the discovery of these beautiful flowers in the Scilly Isles upwards of 200 years ago by a monk, who was an enthusiastic botanist. He then referred to the slow progress made by the popular flower until Mr. Henry Eckford did so much to improve it in the size and colour of the flowers. Mr. Gerhold explained the different characteristic forms of the flowers, and how cross-fertilisation should be effected to ensure success in raising new varieties. He spoke also on the preparation of soils, autumn v. spring sowing, and the application of fertilisers.

Mr. G. Wells opened the debate, and Mr. Julian proposed, and Mr. Malpass seconded a hearty vote of thanks to Mr. Gerhold for his practical and interesting paper, which was carried unanimously.

Beckenham Horticultural Society.

On Friday, the 26th ult., in the Beckenham, Public Hall, Mr. H. Vincent, of Brighton, author of "How to make £60 per annum from half-an-acre of land," lectured on "Up-to-Date Gardening for Amateurs." Councillor Neville presided. This lecture had been arranged specially for allotment-holders, and an audience of 150 had assembled, which, considering the unpropitious weather, was very gratifying. The neighbouring societies from Bickley, Croydon, and Dulwich were strongly represented.

Dual or intercropping seemed to be one of Mr. Vincent's chief points, so that the land is kept fully occupied. In one or two instances this was thought to be too intensive, and parsnips in rows a foot asunder with cabbages between caused some criticism, as also did the statement that all refuse, such as cabbage stumps, etc., should be dug in, the prevailing opinion being that encouragement of "club" and ground vermin would follow. To a question as to trenching, the lecturer said he had nothing to trench, having only a foot of soil resting on chalk, and artificial manures he did not look upon with favour. Potatoes are not treated in the orthodox way, but planted in November eight inches deep, and one is bound to say that Mr. Vincent evidently knows well how to store and start seed potatoes, for some specimens shown by him had short, sturdy sprouts on them, as thick as the top of one's little finger. Very early lifting is also practised. Mr. Vincent very strongly advocated giving the best of attention to all vegetables that are useful in winter, seakale being very profitable.

A hearty vote of thanks to Mr. Vincent was accorded, and the Rev. G. O. F. Griffiths proposed a like compliment to the chairman, who, by the way, gave some particulars of the Council's allotments, and also alluded to the culture of his own allotment, which he carried out himself to the benefit of his health and advantage of his table.

National Amateur Gardeners' Association.

MARCH 2.

At the monthly meeting held at Winchester House, on Tuesday evening last, Mr. T. W. Sanders presided over a good attendance of the members, when an address was given by Mr. George Gordon, V.M.H., on "Garden Dahlias." The lecturer's remarks were wholly confined to the use of dahlias for garden decoration, and the importance of differentiating the culture of dahlias for the production of colour effects in the garden, from the practice which should be adopted in the production of exhibition blooms.

A brisk discussion was followed by votes of thanks to the lecturer and the president.

Chester Paxton Society.

At the meeting held on Saturday, February 27, under the chairmanship of Mr. W. S. Sharpe, Ince Hall Gardens, Mr. Alfred Newstead, curator of the Grosvenor Museum, lectured on "Familiar Wild Birds in Relation to Gardens and Orchards." The lecture was illustrated by a series of specially-prepared lantern slides. Mr. Newstead, in his introductory remarks, referred to the special attention that has been given to birds during the past few years with reference to their economic importance to British agriculturists and horticulturists. In addition to a considerable number of personal observations and field notes, summarised post-mortem records were quoted from a paper on "The Food of Some Birds," by Professor R. Newstead, recently published by the Board of Agriculture, some of which may be tabulated as follows: The Titmice.—31 contained insects of the injurious group; 3, beneficial insects; 7, indifferent insects; 3, spiders; 10, wheat; 4, maize; 5, pear; 3, apple rind; 11, bud scales; 2, vegetable matter undetermined; 4, fungi. The Rook.—5 contained insects of the injurious group; 1, beneficial insects; 6, indifferent insects; 1, mollusc; 2, earthworm; 3, potato; 6, wheat and oats; 1, maize, 1, fragments of pear; 1, vegetable fibre. Barn Owl.—1 contained beneficial insects; 2, indifferent insects; 5, voles; 2, mice; 2, shrews; 1, bats; 3, birds.

B.G.A., Haslemere Branch.

Mr. Brooks, the chairman, presided over a good attendance of members of this branch of the British Gardeners' Association at the meeting held in the Co-operative Hall, Haslemere, on the evening of the 20th inst., when Mr. George Gordon, V.M.H., lectured on "Gardens of Roses."

In his opening remarks, Mr. Gordon spoke of the importance of giving roses a position in the garden where they would have full exposure to the beneficent influence of light, and enjoy a free circulation of air about them. He also directed attention to the necessity for liberally enriching the soil and stirring it to a depth of two or more feet; and the importance of maintaining it in a high state of fertility. The desirability of cultivators differentiating between garden and exhibition roses, and of selecting varieties specially adapted to the respective purposes was referred to, and it was pointed out that while varieties remarkable for the relatively large size, perfect form, and attractive colouring of their flowers should be selected for the production of blooms for competitive purposes, varieties that have a vigorous habit, and are free and continuous in flowering should be selected when the object in planting is beautifying the garden.

Then, with the aid of about sixty lantern slides, Mr. Gordon proceeded to describe the various ways in which roses can be utilised in gardens, and pointed out the best methods of procedure to ensure the most satisfactory results.

At the close of the lecture Mr. Gordon was accorded a hearty vote of thanks, and this was followed by a discussion on the work of the British Gardeners' Association, in which the Chairman, the Hon. Secretary, and several of the members took part.

Royal Society for the Protection of Birds.

An exceptionally interesting and largely-attended annual meeting of the Royal Society for the Protection of Birds was held recently at the Westminster Palace Hotel, when, in addition to the adoption of the report and election of officers, the proceedings included the presentation of the society's gold medal to Mr. A. Holte Macpherson, F.Z.S., as winner in the society's international competition for an essay on "Comparative Legislation on Bird Protection." The second prize, of ten guineas, went to Colonel A. G. Momber (San Remo).

The Duchess of Portland presided at the meeting, and in speaking of her warm sympathy with the society, of which she is president, said she longed for the day when all ladies would leave to the birds their beautiful plumage instead of wearing dead bodies with glass eyes for the supposed adornment of their hats. Sir John Cockburn also eloquently denounced the wearing of plumage. Mr. F. E. Lemon (hon. secretary) made special reference to the story recently circulated by the trade that "osprey" plumes are moulted feathers, and to the complete answer to this contained in information received by the society from H.B.M. Consuls in Venezuela and the Argentine, and from the United States; he also drew attention to the fact that three of the watchers employed by the Audubon Societies had recently been murdered at their posts, two of them in Florida, where they are specially employed in protecting the remaining egrets.

The valuable work done by the watchers of the society in the preservation of rare British birds, and the zeal of its inspector among the birdcatchers, were spoken to by Mr. Trevor-Battye, who strongly appealed to landowners for further support to the Watchers' Fund; and Mr. Montagu Sharpe (chairman of council) said that he would not rest satisfied until he saw the society with five times its present income (which is under £1,000), in order that it might have the power to carry out its objects, and with at least one inspector in every county. Sir William Anson referred to the excellent educational effect of the Bird and Tree Challenge Shield competitions in elementary schools, of which he has knowledge in his own county. Other speakers included Julia Lady Tweedale, the Earl of Stamford, Captain Tailby, Mr. Meade-Waldo, and Mr. Champion B. Russell; and among those also present were Lady Forester, the Hon. Mrs. Arthur Henniker, the Hon. Mrs. Boyle, Mr. Dresser, Dr. Penrose, Mrs. Sturge, Mr. W. L. Fisher, and Mr. Ernest Bell.

TRADE NOTES.

A great deal of interest was created last year by the offer from Messrs. Rogers and Co., Leamington, of £100 as a first prize for the best Leamington Giant onion raised from seed supplied by them. There was an extraordinary competition, and Mr. A. R. Searle, of Castle Ashby Gardens, was the fortunate winner of the prize. This season the Messrs. Rogers are offering £200 in prizes for fine examples of their onion, and full particulars can be obtained from them. Messrs. Rogers and Co., have recently issued an eight-page pamphlet, entitled "Onions and their Culture," in which Mr. A. R. Searle describes the method of culture he follows at Castle Ashby, and which enabled him to win the great prize in 1908. This pamphlet can be obtained for 3d.

FORTHCOMING ENGAGEMENTS.

SATURDAY, March 6.—French Horticultural Society of London.

MONDAY, March 8.—United Horticultural Benefit and Provident Society at Royal Horticultural Hall, Westminster: Chair to be taken at 8 o'clock by Mr. C. H. Curtis.

TUESDAY, March 9.—Royal Horticultural Society: Fruit, Floral, and Narcissus Committees meet at 12 o'clock; Lecture by Mr. W. S. Murray on Tulips and the Tulip Mania, at 3 p.m.; Scientific Committee at 4 p.m. Competitive Show of Forced Bulbs.

WEDNESDAY, March 10.—Royal Botanic Society; Fellows' Dinner.

ANSWERS TO CORRESPONDENTS.

SIZE OF CROQUET LAWN. — Captain Mander, of The Red House, Ely, kindly writes to say that our advice to "A. P. M., Chichester," (p. 178), respecting the size of a croquet lawn is incorrect. He states that the rules of croquet are now governed by the Croquet Association, whose office is at 47, Fleet Street. The lawn should be 35 yards by 28 yards, instead of 40 yards by 30 yards, and the hoops and pegs should be seven yards from each other each way and seven yards from the boundary. If a smaller ground is used keep the hoops, etc., still in equal proportions. Our diagram and measurements were taken, if we remember rightly, some years ago, from the rules of the All England Croquet Club regulations, and though we have published them on several occasions, they have never previously been called into question. We are obliged to Captain Mander for his correction, but we wonder what our friend, the Rev. J. H. Pemberton has been doing to let us make this mistake without question? We thought he was as keen on croquet as he is after new roses!

WEEDS IN LAWN.—J. H. M., Ely.—If the lawn is as weedy as would appear from your letter, we doubt whether it can be brought into proper condition by any means short of the removal of the turf and laying down good lawn grass seed. However, lawn sand will work wonders if used strictly in accordance with the directions sent with it. The brands vary somewhat, therefore, it will be the best plan for you to write to the several firms who advertise lawn sand in our columns, or who specialise in everything connected with lawns, asking for the price of the material and the amount necessary for your own lawn, giving them the correct dimensions.

BOOKS ON HYBRIDISATION OF PLANTS.—F. E. T., Hereford: An exceedingly interesting book that deals with hybridisation in a very clear and yet popular way, is "Cultivated Plants: Their Propagation and Improvement." It was written by the late Mr. F. W. Burbidge, and published in 1877 by W. Blackwood and Sons. If we remember rightly, the price was 12s. 6d., but the work is probably not obtainable now, except from secondhand dealers, though it is kept in many public libraries. "Plant Breeding," by Professor L. H. Bailey (Macmillan and Co.; 5s.), is a useful work on the subject. The most up-to-date and scientific treatises on the subject of hybridity are to be found in "The Report of the First International Conference on Genetics," 1899; and "The Report of the Third International Conference on Genetics," 1906; both of which may be obtained from the Royal Horticultural Society, Vincent Square, Westminster, S.W., for 5s. each. The "Report of the Second International Conference on Plant Breeding and Hybridisation" is an American publication, as the second conference was held in New York; it is to be obtained from Mr. L. Barron, 136, Liberty Street, New York, U.S.A.

BAIT FOR MOLES.—In our issue of February 20 we asked for information relative to the use of any kind of bait for mole traps. Mr. E. Rowbottom, of The Court Gardens, West Wickham, Beckenham, very kindly sends us the following note on this subject: Mole catchers, like charcoal burners and gamekeepers, are noted for keeping their special knowledge to themselves, and one has to be on very friendly terms with them to discover their secrets. I once heard a mole catcher tell a friend that for baiting mole traps he used worm oil. He caught a lot of worms, and placed them in a tin can or glazed jar, without any earth or other material, and left them thus for several days. He then extracted the oil from them, and put it in a small bottle, corking it tightly. When setting traps for moles he, with a small brush, placed some of this worm oil upon the trigger. This was his story, and I suggest that your Kidderminster correspondent puts the recipe to the test. I may also add that the thickly-spined branches of whitethorn or blackthorn, pushed into mole runs, will effectually prevent trouble in the same direction, but it might only cause the trouble to arise in another place.

DESTRUCTION OF VERMIN. — Most gardens are pestered with Rats and Mice. Every effort should be made at this time of the year to exterminate them before seeds are sown. Danysz Virus is first rate stuff for killing these vermin. Single tube, 2s.; three tubes, 5s. Post free from DANYSZ VIRUS LTD., 52, Leadenhall Street, Garden Dept., London, E.C. [Advt.]

COST OF PERGOLA WALK.—G. W., Scarborough: The particulars given are so scanty that we cannot arrive at the cost of construction. You do not give the width of the path, nor the distance to which the excavated material would have to be removed. Further, would the brick rubble have to be purchased as well as the gravel, or are these obtainable on the estate? You ought to be able to remove the soil one foot deep at the rate of from 3d. to 6d. per cubic yard. Brick rubble and clinkers may possibly be had for the cost of carting. In a general way, bearing in mind the different costs of labour and material in different districts, the cost of a good gravel path would be about 4s. per square yard.

EXAMINATION PAPER. — A. R. W., Hastings: We cannot say whether the examination paper set for the recent examination in horticulture by the Royal Horticultural Society is yet obtainable, but you could ascertain by enquiring of the Secretary, Royal Horticultural Society, Vincent Square, Westminster, London, S.W., enclosing a stamped addressed envelope for reply.

MAGGOTS IN SOIL.—H. M., Stourbridge: The "maggots" are the grubs of a species of Otiorhynchus. There are two species very much alike, i.e., the Clay-coloured Weevil and the Vine Weevil, and both are very destructive in the beetle or weevil state, while in the larva state they also do damage to roots, and when in flower pots, will quickly account for the plants therein. Ferns and cyclamens they seem to be particularly fond of. It is probable the grubs were imported in the leaf-soil, and we suggest, therefore all the leaf-mould used should be subjected to great heat to sterilise it before use in potting compost. When plants are attacked they should have the soil shaken away and the roots washed, and be repotted in light, sterilised soil, or the pots may be submerged in tepid water for a day to kill the grubs.

CROWS IN A GARDEN.—C. F. A., Kidderminster: We take it that you refer to rooks rather than to crows, as the latter do very little harm in a garden, and are more likely to do good, as they are more carnivorous than herbivorous. Rooks detest gunfire, and there is no need to shoot many to frighten the rest away, especially if a gun is fired now and again during seed-sowing time. Scarecrows are of little value, but feathers or glass, or small bells, set on wire or string, and so arranged that very little motion will put them in action, will usually disconcert birds, and one may often tide over a critical period by means of them, ere the birds discover the trick played upon them. A boy with a clapper, starting directly after daylight, and keeping about until "the rooks go home," is the only other suggestion we can offer.

NAMES OF PLANTS.

P. A., Beckenham.—Chorozema L[illegible]

B. T., Swindon.—Chimonanthus fragrans.

E. G., Colchester.—1, Carex brunnea; 2, Polygala Dalmaisiana; 3, Acacia long[illegible]

S. A. S., Tenterden.—1, Gasteria verrucosa; 2, Quercus Ilex; 3, Odontoglossum gloriosum.

N. S. E., Derby.—1, Veltheimia viridifolia; 2, Jasminum nudiflorum; 3, Cypripedium Euryades; 4, Dendrobium heterocarpum.

O. T. B., Bedford.—1, Opuntia [illegible] dasys; 2, Acacia lophantha; 3, Ce[illegible]ciata; 4, Peristrophe speciosa; 5, B[illegible] brasiliense; 6, Clivia miniata.

IF YOUR GARDEN IS PEST-RIDDEN USE "KILOGRUB."

Prompt treatment with "Kilogrub" is the only sure way to free your soil from insect pests.

Two or three ounces of

"KILOGRUB"

to every square yard—well distributed and worked into the soil—is sufficient to destroy all insect pests in the soil.

"Kilogrub" gives off chemical fumes which are deadly in effect upon insect life, but are absolutely harmless to plants—it has been thoroughly tested—hundreds of gardeners having tried it with complete success on severely afflicted gardens.

CATALOGUES RECEIVED.

A. AND E. MOSS, KING WILLIAM STREET, E.C.—A very distinct, illustrated, and useful catalogue of flower and vegetable seeds. A speciality is made of collections to suit all pockets, and there are cultural notes and a calendar of garden operations.

MESSENGER AND CO., LIM., LOUGHBOROUGH, and 122, VICTORIA STREET, S.W.—This catalogue comes to hand at a season when blinds for greenhouses have to be seriously considered, and also when the kind of garden seat to be used in the summer must be discussed. The catalogue, with its illustrations of garden seats and wood-lath blinds, will prove very helpful.

ANT. ROOZEN AND SON, OVERVEEN, HOLLAND.—As usual, this firm is sending out a very comprehensive catalogue of choice bulbs, etc., for spring planting, together with a seed list. The British agents are Messrs. Mertens and Co., Cross Lane, St. Mary-at-Hill, E.C.

SUTTON AND SONS, READING.—Under the title of the Farmers' Year Book and Graziers' Manual, the Reading firm has issued a finely illustrated catalogue of farm seeds. The records of heavy crops grown in 1908 testify to the value of Suttons' Pedigree swedes, mangels, etc.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page xi.

TO DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

PRUDENTIAL ASSURANCE COMPANY, Limited.

Chief Office HOLBORN BARS, LONDON.

Invested Funds exceed £72,000,000.

SUMMARY of the REPORT presented at the SIXTIETH ANNUAL MEETING, held on 4th March, 1909.

ORDINARY BRANCH.—The number of policies issued during the year was **80,379,** assuring the sum of **£7,614,898,** and producing a new annual premium income of **£440,376.** The premiums received during the year were **£4,616,337,** being an increase of **£135,960** over the year 1907. The claims of the year amounted to **£2,812,962.** The number of deaths was **8,389,** and **15,322** endowment assurances matured.

The number of policies in force at the end of the year was **866,797.**

INDUSTRIAL BRANCH.—The premiums received during the year were **£6,925,755,** being an increase of **£264,124.** The claims of the year amounted to **£2,670,345,** including **£72,696,** the proportion of bonus paid since the date of the last Annual Meeting. The number of claims and surrenders, including **4,355** endowment assurances matured, was **310,722.** The number of free policies granted during the year to those policyholders of five years' standing and upwards who desired to discontinue their payments, was **145,261,** the number in force being **1,395,929.** The number of free policies which became claims during the year was **40,094.**

The total number of policies in force at the end of the year was **17,963,127;** their average duration exceeds eleven and a quarter years.

The assets of the Company, in both branches, as shown in the balance-sheet, are **£71,958,859,** being an increase of **£3,952,575** over those of 1907.

In the Ordinary Branch a reversionary bonus at the rate of **£1 12s.** per cent. on the original sums assured has again been added to all classes of participating policies issued since the year 1876.

The Directors are pleased to announce an increase in the Iudustrial Branch bonus. All policies of over five years' duration which become claims either by death or maturity of endowment from the 5th of March, 1909, to the 3rd of March, 1910, both dates inclusive, will participate. This bonus will be paid by way of addition to the sums assured of:—

£5 per cent. on all policies becoming claims upon which at least five but less than ten years' premiums have been paid,

£10 per cent. on all policies becoming claims upon which at least ten but less than twenty years' premiums have been paid, and

£12 10s. per cent. on all policies becoming claims upon which at least twenty years' premiums have been paid.

Messrs. Deloitte, Plender, Griffiths and Co. have examined the securities, and their certificate is appended to the balance-sheets.

BLACKMORE and LANGDON'S BEGONIAS for BEDDING

A GREAT SPECIALITY.

Special Named Doubles for Bedding.

ARGUS.

Makes a carpet of scarlet unequalled by any other bedding plant. **12/-** dozen, **84/-** per 100.

GLADIATEUR.

Rich crimson; very effective. **12/-** dozen, **84/-** per 100.

HILDA (New).

Deep salmon, with lighter centre, perfect camellia form; vigorous, and of grand habit. **15/-** per dozen.

LORD LANGTON.

Bright scarlet; wonderfully free blooming. **10/-** per dozen, **70/-** per 100.

MARQUIS OF STAFFORD.

Crimson; a well-known and first-rate variety. **12/-** per dozen.

DOUBLE BEGONIAS, Seedling Tubers.

These are of splendid quality, and as our strain possesses an upright habit, which is indispensable in a bedding plant, they are grand for bedding. We offer the following colours: White, blush, pink rose, scarlet, crimson, yellow, orange. **4/-** per dozen, **30/-** per 100.
In Mixed Colours, **3/-** per dozen, **21/-** per 100.

SINGLES, Seedling Tubers.

These are of superb quality, and are unequalled for habit and richness of colouring, in the following colours: White, pink, rose, scarlet, yellow, crimson (a special line), and orange, **3/-** per dozen, **21/-** per 100.
Mixed—**2/6** per dozen; **15/-** per 100.

FRILLED SINGLE BEGONIAS.

These have created a sensation wherever we have exhibited them the last two seasons. **4/-**, **8/-**, and **20/-** per dozen.

Send for Catalogue of Choice Named and other Begonias, Carnations, Border and Tree Varieties, etc., etc.

Twerton Hill Nursery, BATH.

THE GARDEN BEAUTIFUL

"HAWLMARK" SEEDS ARE TESTED.

All the seeds offered by Messrs. Alex. Dickson and Sons, Ltd., under the registered name of "Hawlmark" are carefully tested at the various trial grounds; so that our customers can rely on securing blooms unsurpassed in quality and growth.

Our Illustrated List, which is the only one containing full trial ground reports, will be gladly sent, post free, on request to

GLADIOLI.

The great range and almost endless combinations of colour of the Gladiolus is hardly equalled by any other flower.

OUR HYBRIDS possess the most exquisite colourings, with blooms of exceptional size, and are borne on large and vigorous spikes, while so great is the diversity that purchasers of 100 corms will get but few duplicates. We consider them equal to any named sorts, and the cost is about one quarter.

WINNERS OF MANY AWARDS DURING 1908.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

A Destructive Disease of the Apple.

The apple tree has many enemies with which to contend in the making of its seasonal growth, and the production of its crop; and of these some are so destructive in their effects on the growth of the fruit that it would not be a light task to determine with scientific exactitude which of them is the most injurious. Were it practicable to readily accomplish a satisfactory differentiation between the most injurious of the several pests, it is doubtful whether any useful purpose would be served in so doing. We are anxious to induce all growers to take a greater interest in the enemies of the apple, and, as the result, to study their ways, or, to be more exact, their life histories, and to use every endeavour to ward off attacks and repress them when made. It is not sufficient to provide the trees with the soil exactly adapted to their requirements and to prune with skill, they must be kept free from everything hurtful to their health. The disease of the apple to which we are especially desirous of directing attention at the present time is that commonly known as "apple scab," which is caused by Fusicladium dendriticum, one of the most destructive of the fungi that infest the apple tree and its fruit. This disease is general over the whole of the United Kingdom, and it is sufficient to walk through the markets to which apples are sent during the autumn to obtain a good idea of the immense loss that growers annually suffer from the ravages of the fungus by which it is caused. If the trees are only moderately infected, the fruits will be marked by a few isolated black spots, which are quite sufficient to materially depreciate their value in the market and render them less serviceable for use at home. When the disease is virulent the spots coalesce, large brown patches are formed, and later on, owing to the inability of these portions to expand at the same rate as the other parts, they crack in various directions, and the fruits become misshapen and practically worthless. Growers usually have their attention first attracted to the disease by the appearance of black spots on the young fruits, and, as a consequence thereof, it has been assumed by many that it is confined to the fruit. This, however, is not the case. The disfigurement of the fruit is evidence that the disease is present on the same or neighbouring trees. If the leaves are, with the aid of a pocket lens, subjected to a careful examination, dark brown or very deep green patches of variable size will be found mostly on the upper surface, but on the underside as well, these patches having somewhat of a sooty appearance. These patches are proofs of the presence of the disease, and from these enormous numbers of spores are carried, by the wind and other agencies, to the fruit and other leaves, which they infect. Sometimes the young shoots also are infected, but, generally speaking, the disease does not do a large amount of damage to the growth. Its presence in the shoots is, however, a serious matter, inasmuch as the fungus that has hibernated in them produces its spores about the same time as the leaves are in process of development and the young fruits are commencing to swell and especially liable to fungoid attacks. It is satisfactory to know that, although the disease is general over the United Kingdom, and most destructive in its effects upon the crop, it is not specially difficult to keep trees free from it, or so far free from its attacks that but little damage will be done. The remedy is systematic spraying of the trees with Bordeaux mixture. The first spraying should be done when the young leaves are unfolding, and before the flowers commence to expand, as at that stage the fungus is becoming active and may be readily checked. Immediately the flowers have fallen the trees should receive a second spraying, and in plantations where the disease has been very rife, the trees should be sprayed a third time some sixteen or seventeen days later. The preparation of the Bordeaux mixture requires sufficient care to ensure the different ingredients being of the proper condition and used in the right quantities. Mr. E. S. Salmon, of the Wye College, who has given much attention to fungoid diseases, recommends a mixture prepared as follows: Copper sulphate (98 per cent. purity), 4lb.; quicklime, 4lb.; and water, 50 gallons, and advises that the lime be as freshly burnt as possible, air-slaked lime being useless for the purpose. The copper sulphate is dissolved in water in a wooden tub, and, if wanted at once, sufficient hot water should be used to dissolve it quickly, and when dissolved sufficient cold water be added to bring up the quantity to 25 gallons. Otherwise, 25 gallons of cold water may be put in the tub and the copper sulphate, in a piece of coarse sacking, be suspended in the water. The lime, in accordance with Mr. Salmon's advice, should be put in a tin pail and water added until it has been slaked and converted into a

MR. GEORGE WARD.
Superintendent of the Brighton Public Parks.

creamy paste. The lime milk is then put into a tub and sufficient water added to make 25 gallons. When practicable the whole of the water should be added to the lime milk and to the solution of copper sulphate before they are mixed. It is important to test Bordeaux mixture previous to use to ascertain whether the whole of the copper sulphate has been precipitated, for unless this is the case injury may be done to the leaves and young fruits. Immersing the blade of a penknife in the mixture for a minute or so is considered a good test. If the blade is unchanged when removed the mixture will be safe, but if changed to a copper colour, more lime must be added. In Mr. Spencer Pickering's opinion, the best test is to put a few drops of a solution of potassium ferrocyanide in a saucer and to drop into this some of the Bordeaux mixture. Brown or red colouration indicates that there is copper in solution, and that additional lime is required. The spraying of fruit trees with Bordeaux mixture entails a considerable amount of labour, but the results far outbalance the cost, and apple scab should no longer be tolerated.

Mr. G. Ward has rendered such excellent service during the period he has occupied the position of superintendent of the Brighton Parks and Gardens, that visitors to this popular seaside resort will not need to be told that the open spaces under his charge bear in a marked manner the impress of his skill and good taste. The more important of the Brighton parks are Hollingbury Park, which has an area of 180 acres, and was purchased by the town nine years since. Preston Park, a finely matured open space, with an area of 62 acres, and remarkable for its sylvan beauty, and Queen's Park, which was purchased in 1892. The last named open space, if not remarkable for its area, occupies a charming position, and is highly picturesque. There are several smaller areas which contribute materially to the interest of the town and the pleasure of the visitors, chief among them being the Pavilion Grounds, which are not less noteworthy for their historical associations than for their beauty.

Fruit Imports in February were somewhat smaller than in the corresponding month of last year, but the decreases were more marked in the quantities than in value. Of apples the imports were 248,501 cwt., of the value of £373,736, these figures representing a decrease in quantity of 19,147 cwt. and an increase in value of £408. There was a material increase in the imports of apricots and peaches, the aggregate having been 639 cwt., of the value of £5,395, or an increase in quantity of 430 cwt. and in value of £4,267. In the imports of bananas there was a decrease of 29,779 bunches, the total having been 390,298 cwt., of the value of £111,717. The imports of grapes aggregated 1,090 cwt., of the value of £5,449, or a decrease in quantity of 416 cwt. and in value of £1,530. There was a material drop in the imports of lemons, consequent on the terrible earthquake in Sicily, and in the imports of oranges there was a considerable increase. Nuts were also received in increased quantities. Pears make a poor showing in the returns as compared with the corresponding month of last year. The aggregate imports were 1,298 cwt., of the value of £4,872, or a decrease in quantity of 2,107 cwt. and in values of £2,189. Plums on the other hand show an increase in quantity of 695 cwt. and in value of £4,895, the aggregate imports having been 1,135 cwt. of the value of £5,870. Unenumerated fruits aggregated 3,520 cwt., of the value of £5,757, these figures representing moderate increases. The total value of the fruit imports during the month was £726,184, or an increase of £643.

Horticulture at the White City, 1909.—Mr. W. H. Adsett has been appointed hon. secretary to the horticultural and agricultural section of the Imperial International Exhibition, to be held this year at Shepherd's Bush. An influential committee is now being formed. It is intended to hold two international flower shows during the season, and a special feature is to be made of the bedding, which proved so attractive at the White City last year. Several of the leading Continental firms are arranging to provide specimens of bedding out, and it is hoped to secure an adequate British representation, in order that a comparison of the various methods in vogue may be afforded. Full details will be forwarded by the Hon. Secretary, Administration Offices, London, W.

National Dahlia Society.—This long-established society, with which has been incorporated the London Dahlia Union, is showing distinct signs of activity and vigour, as evidenced by the programme of this year's work. In addition to two exhibitions in September next, it has arranged for three trials of dahlias for the purpose of determining the varieties best adapted for garden decoration. These trials will be as follows: garden dahlias in association with the Royal Horticultural Society at Wisley; cactus dahlias in conjunction with Mr. J. T. West at Shenfield, and pompon dahlias at Slough in conjunction with Mr. Charles Turner. The garden dahlias at Wisley will be grown under a distinctive number, and two plants of each variety should be sent in April, to be grown on before planting out. They should be addressed, if by rail, Superintendent, R.H.S. Gardens, Horsley Station, L. and S.W.R.; or, if by post, Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey. New varieties of cactus and pompon dahlias are alone invited for the Slough and Shenfield trials, and these will be grown under number in conjunction with comprehensive collections of varieties in commerce. Two plants of each variety should be sent not later than the end of May, ready for sending out. Those desirous of including their novelties in these trials should notify their intention to Mr. E. F. Hawes, Royal Botanic Gardens, Regent's Park, N.W., and send with the notification the names of the varieties intended for trial. These names will be registered in numerical order, and the corresponding number with address label will be returned ready for despatch to the trial ground. All packages should be sent carriage paid. On arrival they will be carefully planted, be supported with a single stake and grown without disbudding.

Royal Society.—The fifteen candidates that have been selected by the council of the Royal Society to be recommended for election at the annual meeting include Mr. A. D. Hall, the director of the Rothamsted Experimental Station, and Dr. A. B. Rendle, the distinguished botanist.

Vegetables of Foreign Growth were much less plentiful in February than they were in the corresponding month of 1908, but owing to the comparatively high prices that obtained for onions the drop in value was less proportional to the quantity than is usually the case. With the low prices that ruled throughout last month it is not surprising there should have been a considerable decrease in the imports of potatoes. Last year the aggregate for the month was 509,195 cwt., of the value of £102,037; this year for the same period it was only 41,401 cwt., of the value of £12,293. The onion imports amounted to 536,963 bushels, at the value of £109,500, these figures representing a decrease in quantity of 206,947 cwt., and an increase in value of £29,429. Tomatoes were imported in smaller quantities, the total having been 58,610 cwt., of the value of £44,167, or a decrease in quantity of 10,740 cwt., and in value of £13,201. The value of unenumerated vegetables was £43,252, or an increase of £5,727.

Welsh National Emblem.—We are informed by a Welsh correspondent that strenuous efforts are being made in the Principality to substitute the daffodil for the leek as the national emblem, and that considerable success has already been achieved. Daffodils were worn by large numbers of Welshmen, and, indeed, by Welsh women, on St. David's Day, both at home and in other parts of the United Kingdom, and we should certainly prefer to see the daffodil substituted for the leek, although the wearing of that highly odoriferous vegetable has become obsolete. It is suggested by some of the partisans of the daffodil that there is justification for the belief that it was really the old floral emblem of Wales. We should be pleased to accept the suggestion, but are quite unable to do so, inasmuch as we cannot find any evidence in support of the views of those who regard the daffodil as the older emblem. There is no occasion to question the tradition that St. David caused the Britons under King Cadwallader to wear a leek in their caps. They provéd victorious against the Saxons, and recalled their victory by wearing a leek on March 1. In "Henry V.," Shakespeare makes out that leeks were worn by the Welsh at the battle of Poitiers, for Fluellen says, "If your Majesty is remembered of it, the Welshmen did good service in a garden where leeks did grow, wearing leeks in their Monmouth caps, which, your Majesty knows to this hour, is an honourable badge of service; and I do believe your Majesty takes no scorn to wear a leek upon St. Tavy's Day." Our correspondent has not stated whether any particular daffodil was worn on St. David's Day, or whether several varieties were utilised. We would suggest that Sir Watkin should be accepted as the form most suitable, as it possesses boldness and beauty in a marked degree, and is a native of Welsh soil.

Children's Hyacinth Show. The exhibition of hyacinths grown by children belonging to the Glasgow Southern District Sabbath School Union, recently held in the Dixon Hall, was highly successful. Mr. A. Cameron Corbett, M.P., presented 18,000 hyacinth bulbs to the schools in association with the union, with the condition that each school should contribute twenty plants to the show. The hyacinths contributed by the seventy-five schools were about equal in number to those shown last year, but on the whole the spikes were in a higher state of development.

School Garden at Willesden. At a recent meeting the Willesden District Council decided to convert a portion of the grounds of Dollis Hill House into an English garden, for the instruction of school children in the art of gardening.

CLIMBING FRENCH BEANS.

A type of bean greatly neglected in gardens is the Climbing French. Why this should be the case I am totally at a loss to understand, unless it is that growers cannot get away from the methods adopted long ago of growing only the Dwarf French and Scarlet Runner beans. I feel sure, if these climbing varieties were more generally grown, there would soon be fewer of the dwarf beans catalogued than is at present the case. All the varieties known to me are exceedingly prolific, and, apart from that their cropping is continuous, which cannot be said of a great many dwarf varieties. For supporting their growths good pea-sticks or stakes that stand some five feet or so out of the ground are required if clean pods and maximum crops are expected, and that should be the aim all through.

For main crops under glass, where three feet or so of head room can be given, one or two plants in 8in. pots trained up sticks will yield far more beans in a given space than is possible with the quite dwarf forms and their varieties. Tender and True or Princess of Wales cannot be excelled for the purpose. The most up-to-date gardeners know of their value for planting after melons and cucumbers are cleared in the autumn; and plants are raised in small pots for transferring to beds of this description and trained up under the roof to supply valuable late autumn and early winter supplies that are always appreciated. As a matter of fact, when outside crops are killed, some persons call to mind that there are such delicately flavoured things as French beans, but one ought not to wait till then before being able to realise the value of such excellent vegetables.

The Channel Islanders have taught us how to produce French beans and peas in quantity under glass, and, if this type of bean were not more profitable than the dwarf ones, it would have been dropped long ago, but the reverse is the case, and this is mainly why I write of their good qualities. Undoubtedly one of the reasons why it is difficult to dispose of these beans in the open market after the Runners appear is that they are allowed to become tough and stringy, and in such a state they are practically useless, and cannot be in any way compared to the young tender pods that are more delicate in flavour than their rougher skinned Scarlet Runner brethren.

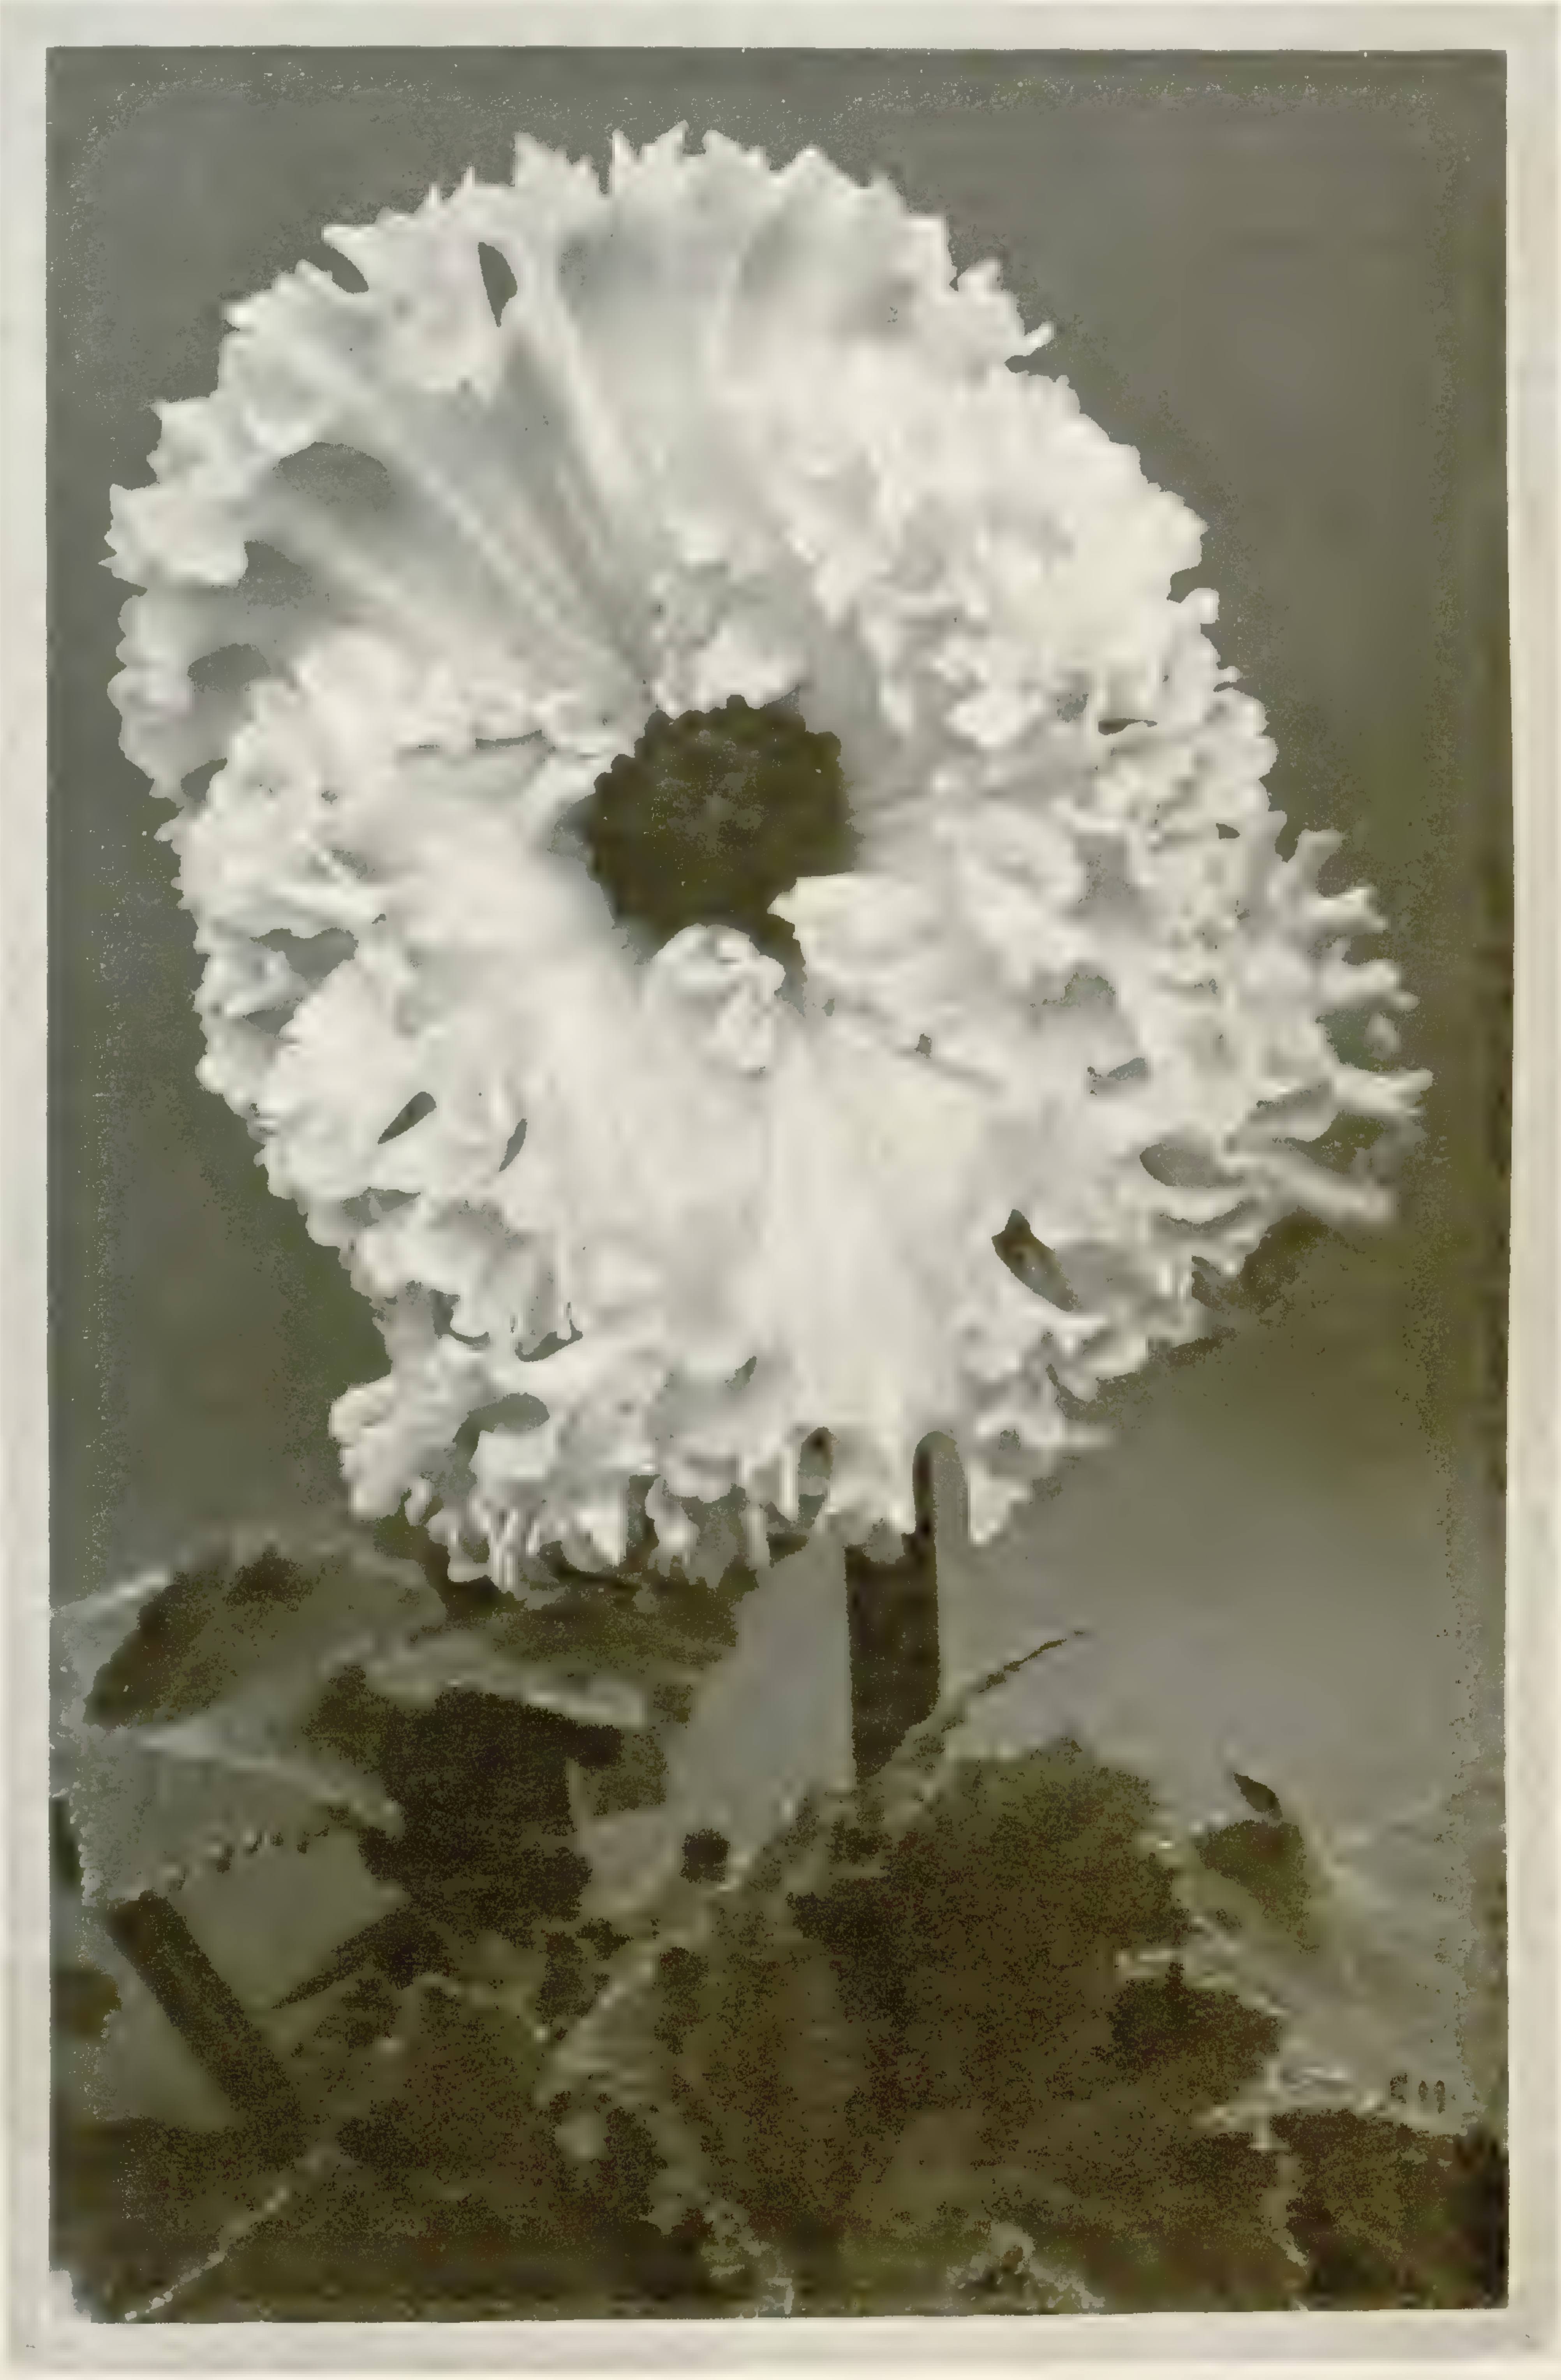
Apart from the two distinct varieties named, and whose pods remind one of good types of Canadian Wonder, there are other distinct and valuable varieties, such as Earliest of All and Epicure; these are very early and also very prolific, the pods are almost round, very succulent and fleshy, and the varieties crop heavily. Gathered quite young and served whole these beans are delicious vegetables, but because they are not of the shape and size usually found in English gardens we have found it difficult to market them, and, until our customers have been persuaded to give them a trial, they were thought to be old, because of their thick fleshy nature. When known they sell rapidly enough, and are preferred to the ordinary dwarf forms. Two at least of these climbing French beans ought to be grown in every good garden, and no persuasion should be necessary to induce anyone to take up their cultivation, because they have real merits of their own, and are, from an economical standpoint, indispensable to the economiser of space.

For very early crops sow seeds singly in small pots during early April, and transplant into the open when properly hardened, giving protection if necessary from cold winds and late May frosts.

Reading. Charles Foster.

FRILLED BEGONIAS.

One of the never-failing wonders of plant life is to be found in the extraordinary variation that may arise in any highly cultivated race of florists' flowers. In few, if any instances can such great variety of form and colour be found as in tuberous begonias, where the rose, the pæony, the water lily, and the hollyhock have all, so to speak, been reproduced. This is among double varieties. The single ones kept fairly regular for a long number of years, and then, taking advantage of small suggestions on the part of certain flowers, the raisers commenced to evolve the crested and the frilled varieties. The crested tuberous begonias are distinctly interesting and effective, but for real beauty they do not compare with the finest of the frilled varieties. Messrs. Blackmore and Langdon, of Twerton Hill Nurseries, Bath, have been very successful in this, as in other directions, with tuberous begonias, and at the Holland House Show last year their display of frilled begonias constituted one of the great attractions. This firm has now many shades of colour represented, and the flowers, of fine form and substance, have the edges of the petals beautifully and deeply frilled. A few especially fine forms have been named, and one of the best of these is Frilled Queen, a charming pink shade, that gained an Award of Merit from the Royal Horticultural Society in July last, and one that is figured in the present issue. This serves to show the type of flower found among the frilled varieties, a class that can now be obtained true from seed.



BEGONIA FRILLED QUEEN.
Flowers bright pink; A.M., R.H.S., July, 1908; Messrs. Blackmore and Langdon, Bath.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

OVERCROPPING FRUIT TREES.

Allowing fruit trees to be overburdened with fruit is one of the most common of the various errors made in fruit culture, and though this mistake is made in reference to most kinds of fruit, the apple and pear are usually the greatest sufferers in this respect, doubtless because they are generally grown. Grapes, peaches, nectarines, and figs, being classed as choice fruits, invariably receive more consideration. It is difficult to give explicit directions about the quantity of fruit a tree of any kind, of a given size or age, should be permitted to carry. It depends so much upon the conditions under which it is cultivated. For example, take two trees of any variety of pear or grape of the same age and size, carefully nourish one, and in this respect neglect the other. The manured tree might, without injury, yield a much heavier crop than the other, while the unmanured tree was seriously exhausted by the lighter crop.

The detrimental effect that overcropping has upon the quality of the crop of fruit is of little moment compared with the injury inflicted upon the vitality of the trees by it; so severe is this in some instances that it takes several years for the trees to wholly recover. I have in my mind two pyramidal trees of pear Louise Bonne of Jersey that several years ago carried crops which so exhausted them that they have not sufficiently recovered to either make satisfactory growth or produce fruit of high quality, though it may be said that little more than ordinary cultural measures have been taken in order to improve matters.

I have endeavoured to show that trees after being exhausted by overburdening crops take a long time in an ordinary course to recover from the injurious effects. This state of things can, however, be accelerated by special treatment. In the first place the condition of the trees' roots should be considered, and defects of any description respecting them be rectified. Extra nourishment must be provided by some means, the mode of accomplishing this being carried out to best meet the requirements of individual cases. In some instances it may be desirable, in accordance with the age or size of the trees, to remove the soil containing the roots to more or less near the stem, and replace it with fresh compost made quite firm, in which the roots should be spread; or the surface soil may be removed down to the top roots and replaced with rich soil. A compost suitable for this purpose may consist of turfy loam, mixed with such material as road scrapings, wood ashes, charred garden refuse, and crushed bones. Operations of this character are most satisfactory when carried out early in autumn—as soon as the leaves commence to fall, and they should be completed by applying mulchings of stable or other suitable litter.

Radical measures of this description are necessary in cases only where the soil is naturally of an unsatisfactory description, or has become impoverished. In ordinary cases, at any rate for hardy fruits such as apples, pears, or plums, top-dressings of suitable manures usually readily promote good wood growth and improved crops of fruit. There are many most valuable materials for top-dressing commonly available, which are more or less effective according to the time of year they are made use of. Comparatively slow-acting ones, such as farmyard manure, vary greatly in value. Bonemeal and kainit should be applied in autumn, while superphosphates, nitrate of potash, muriate of potash, and similar soluble artificial compounds, act best when applied in spring and early in summer. Lime, particularly where used in conjunction with decomposed or charred garden refuse, or similar material, is also valuable, especially for stone fruits. Farmyard liquids, when judiciously utilised, are invaluable quick-acting fertilisers; our experience with them, however, has shown that they cannot be safely used without their strength being first determined, and reduced by dilution when necessary.

Severely weakened trees treated as recommended may be still more improved by having their exhausted branches thinned and shortened. This will stimulate new growths, the most suitable of which, to retain the symmetrical form of the trees, should be selected to replace unsatisfactory branches. This new wood will readily become fruitful, and produce finer fruit than will the older branches. It is well known how quickly exhausted vines become invigorated when treated as has been advocated in these notes, and other kinds of fruit, though not so commonly operated upon in this way, respond equally well to the practice.

T. Coomber.

The Hendre.

PRUNING ROSES.

Few things distress the rose lover more than the reckless and thoughtless way the most valuable growths of last season are cut away under the guise of pruning. Mutilation would seem a more fitting word.

No hard and fast rule can be laid down, for many roses in the same class or section need a distinct method of pruning if we are to secure good results. With the rapidly increasing number of varieties, and intermingling of classes through hybridisation, this point needs emphasising more than formerly.

At the start it may be as well to note that all newly-planted roses do better if pruned hard the first season. It is best to have wood upon established roots; without this the plants cannot do themselves justice. If planted early, and the wood is exceptionally firm and ripe, or in the case of climbers and others from pots, we can leave a little more wood for the present season's use. In any event, one does not err by close pruning the first year.

It is an excellent general rule to prune the weaker plants harder than those of strong growth. One frequently sees the long shoots made upon the extra-vigorous varieties cut away under the impression that they are comparatively useless, because they made so much growth last season without a corresponding amount of blossom. Now it is almost always the case that these are the most useful growths of any. Varieties which throw up strong shoots usually produce their best and greatest number of flowers from such wood, and this needs pruning sparingly. It is a paradox to many of the inexperienced that we should cut more freely from weak wood than from that of stronger type; the more so that the weaker the constitution of the plant the more we cut away what it has succeeded in forming.

Then we want to consider what purpose we are pruning for. It is one thing to prune in the hope of a few extra good blossoms, and quite another if we wish for a quantity of medium flowers for decoration only. Many of us undoubtedly prune too early. The end of March is quite soon enough to commence in most seasons, and then only upon the hardier hybrid perpetuals, hybrid teas, and Bourbons. A large number of the teas and noisettes, and some of the hybrid teas, are very precocious and push into growth at the first sign of spring. One need not be alarmed because growth, even to the formation of the leaves, takes place in such varieties. Below these eyes there will still be sound and comparatively dormant buds that are far better through delay in breaking; and, if we prune too early the first flow of sap must necessarily go into the top eyes. A little "bleeding," or loss of sap is not so detrimental as was thought a few decades ago.

Always endeavour to keep the centre of a plant open to air, whether a standard or dwarf. Cut down close to the topmost eye left, and use a knife in preference to secateurs. Leaving an inch or two of wood above the eye or bud results in a piece of dead wood that is not only unsightly but never calluses or heals over, and has a tendency to carry decay lower down and harbour many insects.

Most of the fairly vigorous growers of all classes can be cut back to three or six inches of the previous year's pruning, but where practicable it is well to cut out some of the older wood entirely from established plants, otherwise we cannot keep the plants within bounds. This also has a tendency to promote younger growths from the base, and such is the life and strength of all roses, no matter of what class. In the case of extra strong growers, such as pillar and climbing roses, cut away all the wood that can be spared which flowered last season, and replace with ripe maiden growths as far as the plant will allow. Here, too, it is advisable to cut some of the older growths out to the base and afford the bottom ones a better chance. Climbers upon a house or wall, especially such varieties as Charles Lawson and the semi-climbing teas, may be spurred back within two or three inches of last year's pruning.

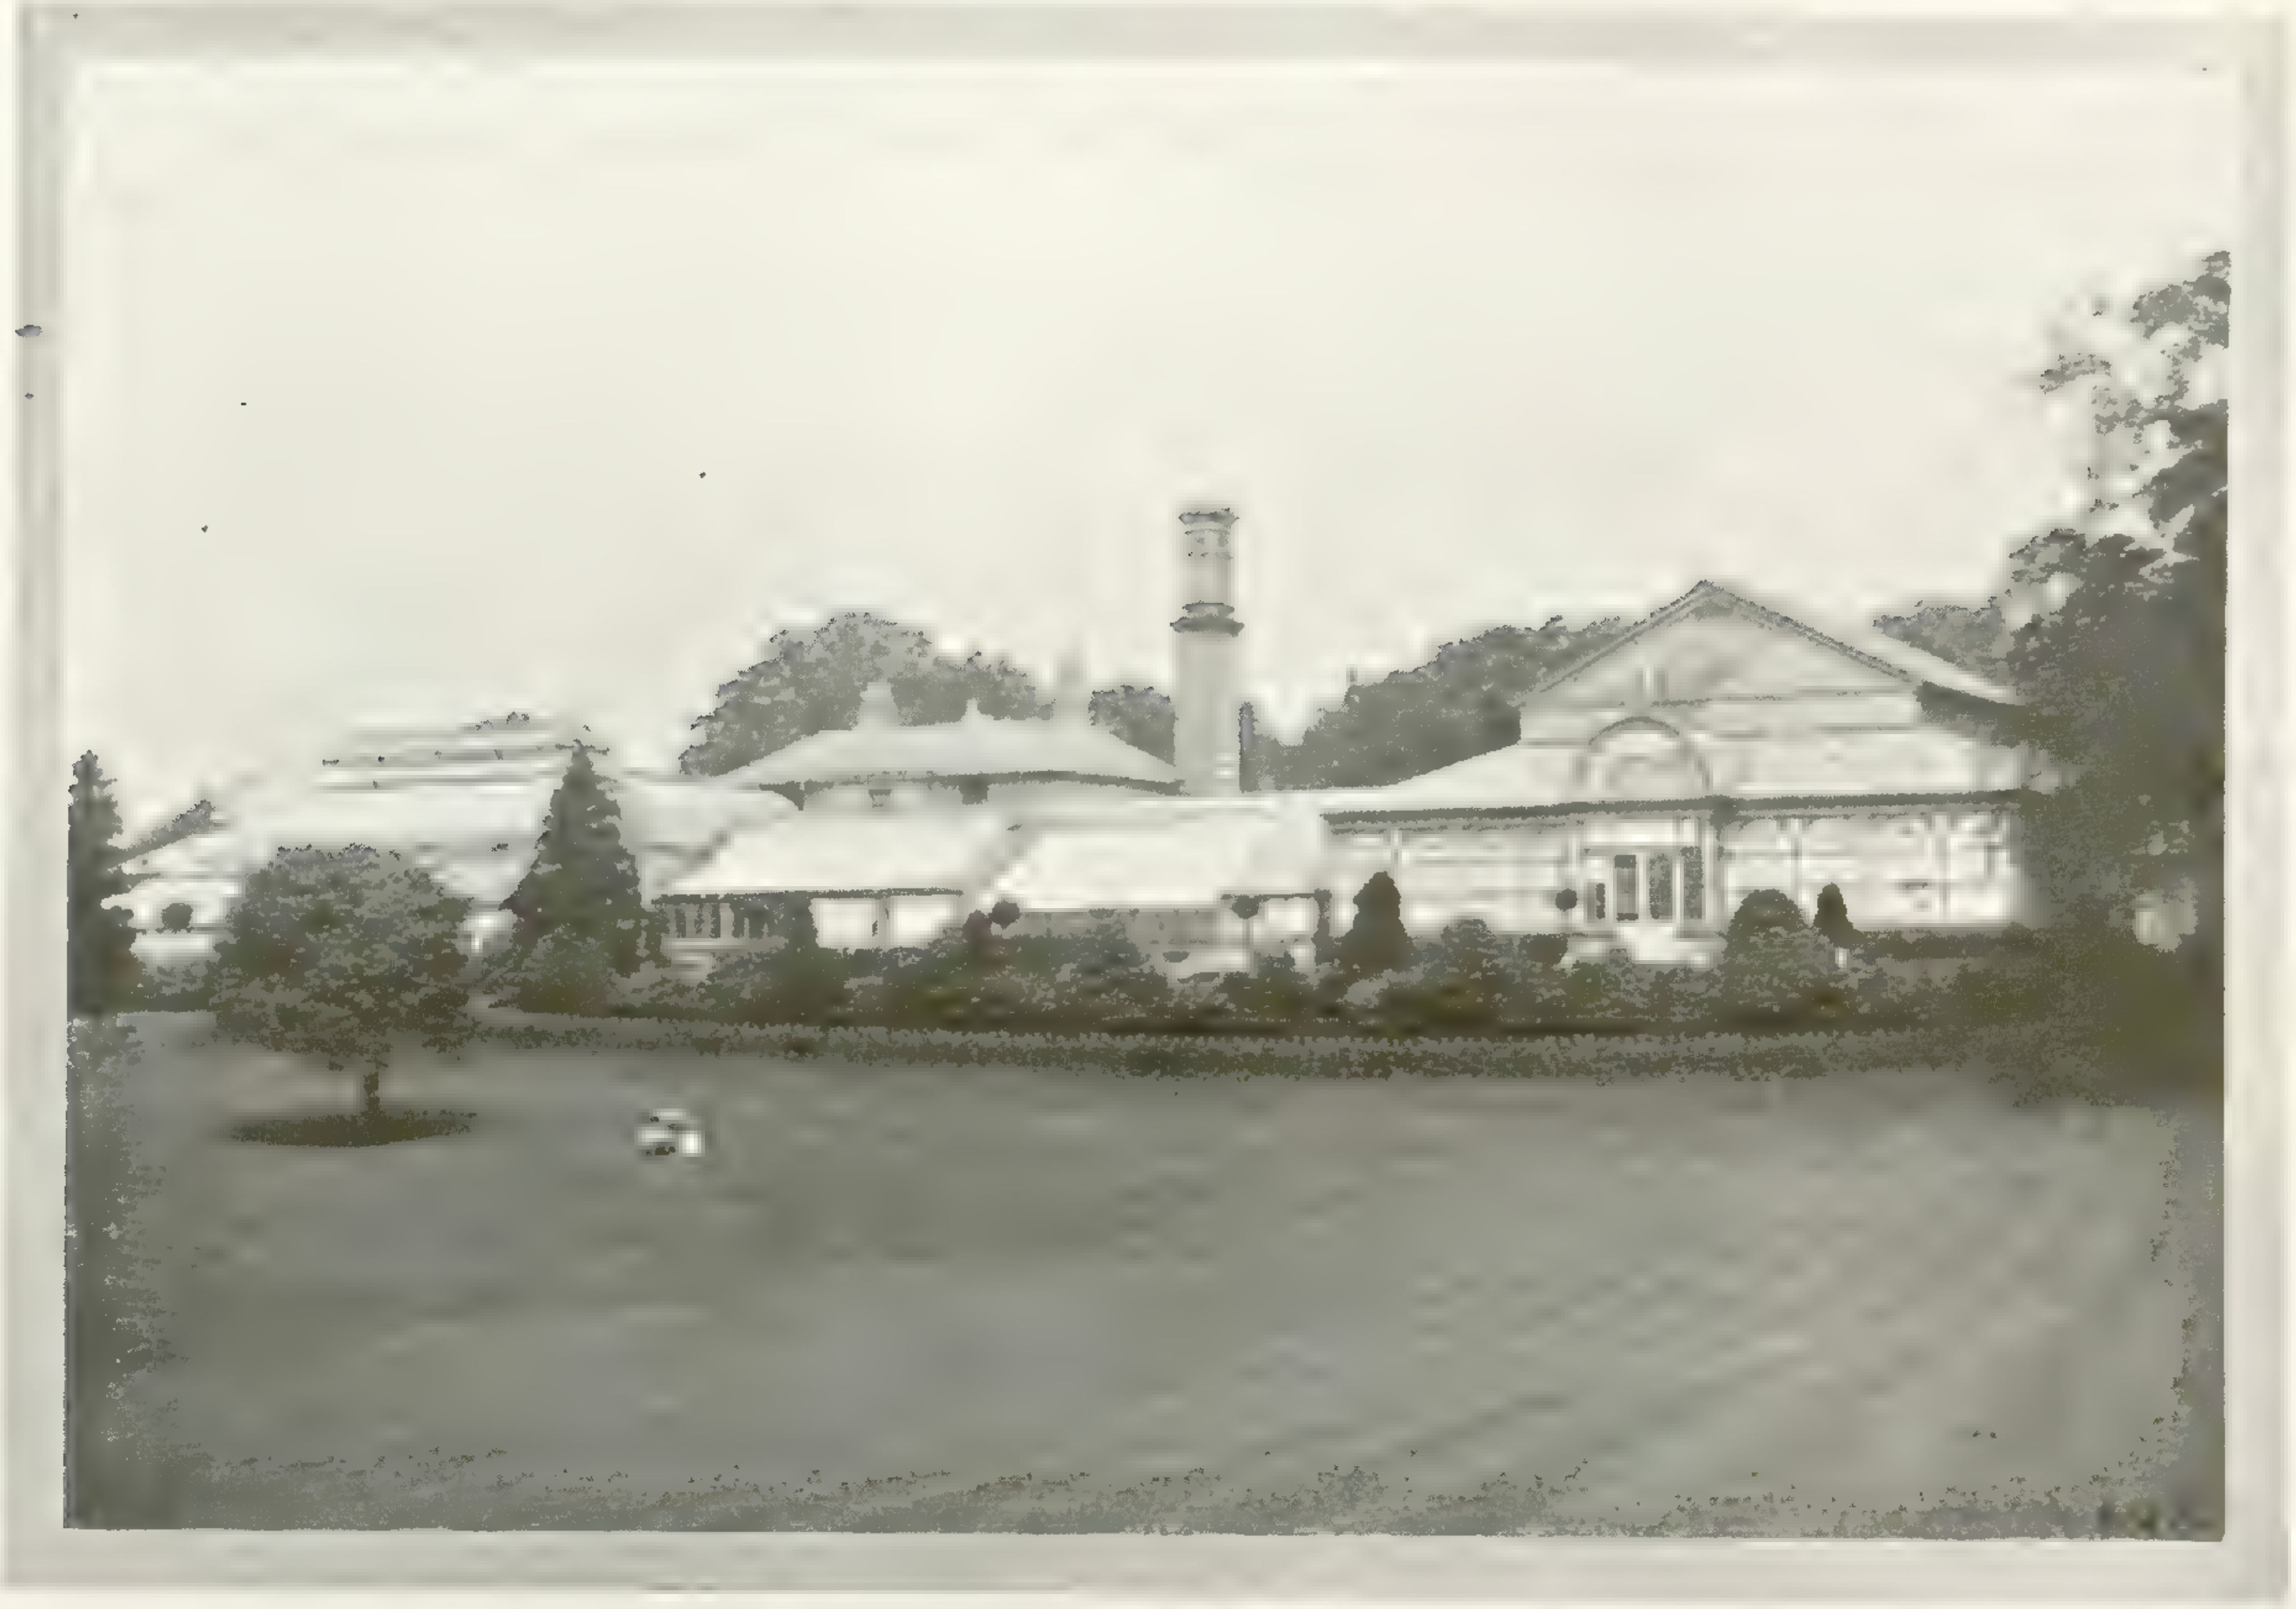
Banksians only need the dead and failing growths removed; the remainder, with the exception of a soft tip or two, may be left. After the first year Wichuraianas, Penzance briars, and those of similar vigour may be left, except to thin out where very much crowded. Crimson Rambler, Dorothy Perkins, Helene, Blush Rambler, and such like may have most of the wood removed that flowered last year. It is the maiden growths of last autumn that are of most service here. Try to retain a good shape in the plant, but do not sacrifice the best growth for this object.

The dwarf-growing polyanthas and Chinas only need thinning. In short, the removal of dead wood and old flower trusses is almost all these want. Teas, noisettes, and hybrid teas of average growth may be pruned similar to the hybrid perpetuals, but affording a little more care to retain the lower growths that so often push from the sides of the plants. Of course, before pruning, one will always cut out dead wood, and in doing this, one often obtains a good insight into how to treat each individual plant.

A few that I have found better when less pruned than is general are Beryl, Gabrielle Luizet, Fellenberg, Dupuy Jamain, the Austrian briars, Maman Cochet, and its white counterpart, Souv. de C. Guillot, Safrano, Marie Van Houtte, Ma Capucine, G. Nabonnand, Homère, Dr. Grill, and Anna Olivier. These vary very much in habit of growth, but scarcely need the knife. I would prune moss and Provence roses quite as hard as the shorter-growing hybrid perpetuals.

A. Piper.

Uckfield.



EXHIBITION HOUSE AND PALM AND ORCHID HOUSES, BOTANICAL GARDENS, EDGBASTON.

SOME BIRMINGHAM GARDENS—I.

The Birmingham district has long been noted for its many good gardens, and for its numerous horticultural exhibitions. The busy Midland city, with its innumerable factories, wonderful jewellery trade, and a host of minor industries, has much need of gardens and open spaces, and, fortunately, the business men have found in their gardens that lie all around the City a pleasant relaxation from business, and a delightful recreation in the culture of flowers and plants. Nor have the needs of the people been forgotten by the City authorities, and so we find within the City's boundaries a fine series of public gardens, playgrounds, parks, and playing fields, all well kept. In the following notes a few of the more important of the private and public gardens at Birmingham are briefly described, to show what is horticulturally possible within the confines of a large industrial centre

Edgbaston Botanical Gardens.

Quite familiar to a very large section of the horticultural public, and especially those who take a keen interest in exhibitions, are the delightful gardens of the Birmingham Botanical and Horticultural Society, situated in Westbourne Road, Edgbaston. It was in 1829 these gardens were founded, and they were designed and laid out by Mr. J. C. Loudon, who, with consummate skill, made the most of his opportunities, so that now the extent of the gardens seems far greater than it really is. The site is one that slopes rather sharply to the south-west, but instead of providing a series of regular and formal terraces, Loudon allowed one long, broad terrace along the top of the site, close by the entrance, and then secured access to the lower parts of the grounds by means of sloping lawns and curving walks, with here and there some special feature to arrest attention, and, consequently, make the descent or ascent appear the more easy.

The society has a membership of less than one thousand, and one is inclined to think that the good people of Birmingham are so busy manufacturing goods for the world at large that they fail to fully realise the value, beauty, usefulness, and real need of this little paradise in their midst. Birmingham is well supplied with parks and open spaces, but here is a semi-private garden, with landscape effects not equalled anywhere else within the City borders, with collections of plants that make it a miniature Kew, and with opportunities for study and recreation not obtainable elsewhere within a reasonable distance. Moreover, everything is well kept and well grown, and Mr. Thomas Humphreys, the able curator, is always delighted to give information relative to plants, flowers, etc., and his long experience at Kew and elsewhere admirably fits him for the post he occupies, and is a guarantee that nothing but the best advice will be given. An annual subscription of 10s. 6d. gives personal admission to the gardens at all times when they are open to members. For 25s. per annum one can obtain a family ticket that admits all the resident members of a family on ordinary days, and two sets of special tickets for reserved days and flower shows, and also private admission on Sunday mornings from 10 a.m. to 1.15 p.m. Anyone who takes up a two guinea share in the society, and also takes out a family ticket, is in the happy position of having a beautiful garden to enjoy all the year through. But he may not pluck the flowers, and, after all, this is not a serious matter, now that flowers are so cheap and plentiful. I am convinced that there are hundreds of people, garden lovers and garden owners, all around Birmingham, who would become members if those who are already members were to use their personal influence. Further, the City Fathers might well make it a point of honour to visit the gardens in state once a year, to draw attention to its beauties and its wonders. A Corporation garden party, or something of the kind, would give the right kind of advertisement.

The Right Hon. Lord Calthorpe is president of the society, Mr. Edward Nettlefold and Mr. Neville Chamberlain are the trustees, and Professor Hillhouse is the hon. scientific director. The fine generosity of the president has served in no small degree to put the society on a better footing in recent years, while the value of the intense interest Mr. Neville Chamberlain has taken in the improvements carried out in late years by Mr. T. Humphreys is hardly to be overestimated.

Under the curatorship of Mr. W. B. Latham, the gardens attained considerable fame, and not a few of the young men who graduated under him are now occupying responsible positions in gardens in various parts of the world. One calls to mind Mr. Raffil in the garden, and Mr. Skan in the herbarium at Kew; Mr. Hales, curator at the Chelsea Botanic Gardens; and Mr. E. H. Wilson, who has collected so many fine new plants in China; all students under Mr. Latham, and there are many others. My point is that Birmingham, as a City, does not fully appreciate its Botanical Gardens. The annual expenditure averages about £2,000, and the subscriptions amount to about £1,100. The average annual admissions of members and visitors amount to 75,000, thus proving the need of the gardens. It would be nothing less than a calamity if, owing to lack of support, the gardens should have to be closed, and the estate cut up for building—but such a calamity is unthinkable in Birmingham, where everyone has a great pride for the City and its various institutions.

But let us stroll round the gardens. We first peep into the useful library of horticultural and botanical books open to all subscribers, and then inspect the big corridor and show house, where so many famous exhibitions are held each year. At one end is the palm house, and the water lily house, where the Victoria regia is a great success. Parallel with the show house are several well-designed houses that contain excellent collections of orchids and tropical plants. The former are largely grown, and include particularly fine specimens of Cypripedium grande, C. Rothschildeanum, C. A. de Lairesse, C. Lathamianum, Cœlogyne Massangeana, Cœlogyne cristata, a large white-flowered species of sobralia, named S. Elizabethæ, etc. Many of the finer hybrid orchids are now included, and for these the society is largely indebted to the generosity of Mr. Joseph Chamberlain and Messrs. Charlesworth and Co. One may mention the cattleyas, thunias, and vandas as being in exceptionally fine condition.

The climbing plants are a great feature of the houses, notably Clerodendron Thompsoniæ, Bougainvillea glabra, red and white lapagerias, the wonderful Aristolochia gigas Sturtevanti, allamandas, stephanotis, and fuchsias trained to the rafters. Ferns are also excellent, and it would be difficult to find equally good examples of gleichenias, or of Dicksonia Lathami and Cyathea medullaris. Large batches of campanulas, primulas, chrysanthemums, gesneras, poinsettias, cinerarias, calceolarias, fuchsias, carnations, salvias, eupatoriums, exacums, and many other showy subjects are cultivated skilfully, and these are necessary for the decoration of the corridor, show house, and the cooler houses, and at no season of the year is the glass department dull. Mr. Humphreys does not believe that a botanical garden should be a dull place, and interesting only to botanical students.

Of trees and shrubs there is a very fine collection at Edgbaston, and these are grouped in a most pleasing manner. Along the outskirts of the garden the effect of overcrowding is to be seen, but this is being remedied as fast as circumstances permit, indeed the improvements recently made have been very marked. The replanting and remodelling of the rhododendron garden has been one of Mr. Humphreys' happiest ideas and greatest successes. The rock garden is a charming spot, and it contains a collection of beautiful plants, some of them of considerable rarity. Gentians and hardy primulas are notable successes, and cotoneasters and Salix lanata are shrubs that at once arrest attention. Nor must I omit the rosery constructed five years ago, and now one of the leading features. In the lowest corner of the gardens there is a water lily pool, its farther margin planted with willows and poplars, and edged with beautiful wild flowers. Of the many famous trees the gardens possess there is not room here to write, but a wonderfully fine old double cherry must not be overlooked, because it is one of the finest in the county, and, thanks to a little judicious thinning around it, its beauty can now be fully enjoyed.

On the terrace there are beds of flowers, where fuchsias, cannas, Calceolaria amplexicaulis and begonias are freely used for the summer display, but the great flower gardening feature is the bank from the terrace to the lawn. Here is the great attraction for those who delight in summer bedding. A different conventional pattern is worked out each summer, and while dwarf flowering and foliage plants are used freely to form the groundwork, the design is always relieved from flatness and monotony by the introduction of groups of pelargoniums, yuccas, agaves, dracænas, begonias, fuchsias, abutilons, and many other effective and graceful plants

AUGUST BANK HOLIDAY SCENE, BOTANICAL GARDENS, EDGBASTON.

But I must conclude, for lack of space, not lack of material to write about, and permit the illustrations to add to this brief garden story.

Whetstone.

The reputation of a garden does not depend upon its size; many gardens of great extent have no reputation worth speaking of, while others of quite moderate dimensions are famous. The famous gardens are mostly those where some distinctive feature is brought as nearly to perfection as human skill can attain, or where some class of plants is grown superlatively well. It does not follow that where the owner or gardener specialises everything outside the speciality is far below the average of good quality, though some folks have an idea that this is almost a rule. After visiting hundreds of gardens of more or less note I have come to the conclusion that where there is a speciality one rarely finds other things below par. The contrast would be too sharp. Specialising in a private garden is usually the result of one or both of two things, i.e., a keen love and enthusiasm for the particular subject on the part of the owner, or a special skill in, and liking for, its cultivation on the part of the gardener.

Whetstone is famous, not only in the Birmingham district, but far afield. It is peculiarly situated, and the situation is not conducive to the best results from a gardening point of view. Right along its longest side the Whetstone garden is bounded by a very deep railway and canal cutting, and a visitor can hardly refrain from wondering whether or no the garden will some day slide down into the cutting below. In short, the garden is too well drained, and it can be no easy task to keep the lawn fresh and green, the roses happy, and the herbaceous plants flourishing in a hot season, and yet the task is accomplished.

The owner of Whetstone, G. H. Kenrick, Esq., who is this year Lord Mayor of Birmingham, is a great lover of plants and flowers, and Mr. J. V. Macdonald, who has been his head gardener for fourteen years, is an enthusiastic plantsman. Experience has shown the best means of overcoming the difficulties of the situation, and the size of the place has made it a fairly easy matter to provide the means and save labour. Whetstone is an admirably equipped garden. The roses are a success, and especially so on the pergola that skirts the tennis lawn. Rock gardening is a feature, and clambering over, prettily clothing the big boulders, or filling the pockets and ledges, are some very fine examples of helianthemums, Veronica cupressoides, saxifrages in variety, cistuses, Genista radiata, gentians, Phlox frondosa, Cotoneaster horizontalis, and many another choice subject. Forming almost a part of the rock garden is the heath garden, and in the peaty bed provided for them many varieties of heaths thrive, and provide a distinct attraction, for at all seasons of the year some of the kinds are in bloom.

Nearer the house, and well in view from the principal windows, is a large bed of flowering cherries in variety, all standards, with a dense undergrowth of Cotoneaster Simonsi. This is a rather unusual association, but it is a successful one. The cotoneasters are kept low, and form a splendid groundwork for the lovely blossoms produced profusely by the trees above in spring and early summer. Rosa rugosa is rather freely planted in beds, and in groups along the boundary line; Blanc double de Coubert is always pleasing, whether in flower or fruit, and it thrives where many other roses would fail. There are limitations in a garden like that of Whetstone, and the great skill of owner and gardener are shown in the cultivation of the choicest of those subjects that can be managed successfully.

The splendid collection of plants under glass is the great outstanding feature at Whetstone, and I have purposely left this until last, lest the impression should be given that the glass department is the only good feature, and my previous remarks be thereby contradicted. There are sixteen houses, of various sizes, but one block consists of eight houses, all opening into a long and beautiful corridor, with a conservatory at the end adjoining the mansion. Passers-by cannot see into the conservatory, but Mr. Kenrick has had a series of exquisitely beautiful panels of flowers, in tile-work, set in the outer wall, that all may see, for, curiously enough, there is neither fence nor hedge around the little lawns that surround the front entrance. The lawns are raised a couple of feet above the road level, and a few stones are placed so as to prevent vehicles from traversing them—that is all. Orchids fill a considerable space in the houses, and it was a pleasure to find a collection of phalænopsis in rude health. Cattleyas fill the stages of another house, and from the roof depends a wonderful specimen of Lælia anceps, on a raft. Dendrobiums are unusually well managed, and D. Dalhousieanum, with growths 6ft. long, and racemes carrying from twelve to twenty-two flowers each, are a revelation. Mr. Macdonald believes in peat, sphagnum, crocks, and charcoal for orchids, and he is no lover of the leaf-mould culture. D. fimbriatum, D. bigibbum, and D. phalænopsis Schroderianum grow, to use a common expression, "like weeds," for love, as well as skilful management go towards their production. You have but to watch Mr. Macdonald handle a Cattleya gigas, or hear him tell the history of Vanda teres and V. t. alba, to understand that he is something more than a clever cultivator.

Besides the orchids, and these are chiefly those needing warm treatment, there are many other plants that are grown with a skill well above the average. Crotons are superbly coloured, and the tall, single-stemmed plants of C. Warreni and others of somewhat similar character, carry bright leaves from pot rim to summit. One house is almost full of the Javanese section of greenhouse rhododendrons, and there are always many of the plants in flower, carrying trusses of beautiful blooms, no matter what the season of the year. Ixoras are splendid, and the charming Fuchsia triphylla is finer here than I have ever seen it elsewhere. Caladiums, gloxinias, achimenes, and amaryllis are all grown largely, and the ever-popular Begonia Gloire de Lorraine is given its rightful place, and the bright B. Winter Cheer is successfully managed.

Climbing plants add to the beauty of the various houses and the corridor, and these include a fine Pleroma macrantha, Gloriosa superba, fuchsias, roses, Begonia President Carnot, habrothamnus, stephanotis, clerodendrons, allamandas, and dipladenias. Dracænas, palms, and ferns are all beautifully clean and healthy. The houses are well built, and there is a water tank beneath the central stage of all those devoted to warmth-loving subjects, as well as a cement trough under each side stage.

Mr Macdonald exhibits largely, and is always found well to the front at Shrewsbury and other shows, where he has to meet competitors from much larger establishments. He is clever at the arrangement of groups of flowering and foliage plants, and has a long record of notable successes. In conclusion, it must suffice to say that Mr. Kenrick's collection of indoor plants is one of the best, most interesting, and most successfully managed in the Birmingham district.

Harborne Hall.

The suburb of Harborne lies a little beyond Edgbaston, and, like the latter, includes a considerable number of interesting gardens within its boundaries. One garden well known in the neighbourhood for its beauty and excellent upkeep is that surrounding Harborne Hall, the residence of Edward Nettlefold, Esq.

The hall has a long garden frontage, from which the lawns and pleasure grounds slope away gently, the land beyond dipping sharply to the south-west into a valley, permitting wide views beyond across to the Lickey Hills and Barnt Green. The gardens, and grounds, and fields, cover an area of about fifty acres. About seven acres are devoted to pleasure grounds, and there is a fine square kitchen garden, just out of sight from the Hall, surrounded by an oak fence. During the last five years the gardens have been almost remodelled, and the work has been done so well that the beauty of the place is certain to increase as the years go by. Mr. and Mrs. Nettlefold take a close and personal interest in their gardens, and Mr. G. Giles, their gardener, is an enthusiast.

What strikes one as being a very uncommon feature of the Harborne Hall gardens is the proximity of the rock garden and the water garden to the house. A broad walk runs along in front of the hall, and at one end, just beyond the hall itself, is the low rock garden, that is always interesting, but of special charm during the spring and early summer. It is a homely rock garden, because everyone can see it and admire the plants that thrive upon it without clambering over or round big boulders, and without going to the other end of the estate to find it. These low, unpretentious alpine or rock gardens ought to be more frequently met with, and in many cases they could be constructed quite close to the home. At the opposite end of the walk, where it curves round the lawn, is the water garden, and this is as simple in its way as the rock garden at the other end. The little pool and its banks have been prettily planted. There is a very fine clump of Gunnera scabra, and there are fine groups of eulalias, pampas grass, spiræas, and Galtonia candicans, the latter being especially fine close to the water. Water lilies of the best kinds flourish in the water, and the bullrushes and aponogeton have to be regularly thinned out to prevent their intrusion upon the lilies.

Roses are a delightful feature at Harborne Hall, and they are freely used to form arches over the paths. The rose garden proper is completely surrounded by a dense, closely clipped, battlemented yew hedge, and it is so cleverly arranged, and so well masked by fine hollies and a broad herbaceous border, that one comes upon it unawares, and receives a very pleasant surprise. The surprises of this kind that one finds in gardens add not a little to the interest of the place. It is a great disadvantage to any garden when its natural form, or its design, permit the view to range over practically all its features. Dorothy Perkins is a fine rose, but rarely is it seen flowering with such freedom and beauty as in the rose garden at Harborne Hall, where a light and elegant pergola is completely covered with it. Other kinds of roses abound in the beds and borders, but this bold planting of Dorothy Perkins has produced a picture that is at once exquisitely beautiful and satisfying.

It is not often one finds a wide herbaceous border cut out in the lawn, as at Harborne Hall. The fine collection of pæonies, delphiniums, pyrethrums, lilies, irises, and all other good things are backed by numerous beautiful hollies, gold and silver and green; indeed, the hollies are fine all over the garden. There is another big border of hardy flowers opposite this one, but it seems to have been in position a long time, while the new one looks as though it had quietly and cleverly worked its way up from the lower ground until now it flings its challenge across the broad grass

A FINE SPECIMEN OF THE DOUBLE CHERRY IN THE STUDENTS' GARDEN, BOTANICAL GARDENS, EDGBASTON.

belt to its older companion. The increasing love of hardy perennials has brought this new border into being, and, in some measure also, the free use made of flowers in the hall has made it a necessity.

Besides the hollies and roses there are many fine specimens of beautiful trees and shrubs in the Harborne Hall gardens. Magnolia conspicua is very fine, and of Berberis stenophylla there is a specimen difficult to excel in this country. Flowering peaches, cherries, and plums are delightful, and Prunus pendula is a very pretty tree. Skimmia japonica, rhododendrons, and azaleas are freely planted in groups, and a careful and skilful use has been made of the golden privet and the golden elder, these giving fine touches of colour among the darker evergreens. A big weeping elm, and a fine deodar also deserve mention.

In the lower part of the garden, among the trees, there is a pretty combination of rock and water gardening. Spring-flowering plants are freely grown, and good effects are produced by the bold planting of polygonums, spiræas, berberis, Japanese maples, groups of herbaceous phloxes, cotoneasters, and, nearer the water, hardy ferns. The bank that forms a sort of connecting link with this garden and the grounds above is planted with phloxes, and it is easy to see that these flowers are very popular with Mr. Nettlefold and his family.

One might dwell at some length upon the fine crops Mr. Giles cultivates in the kitchen garden. Peas, both edible and sweet, are grown particularly well; Mr. Giles believes in giving peas abundance of room, and cropping between the rows. Carter's Emperor runner bean, the new Russian kale, the onions, the seakale, and the cordon gooseberries are all so admirably managed as to attract special attention. In the glass houses the chief attractions are perpetual carnations, cyclamens, primulas, and calanthes. The vineries and peach houses are old structures, and will, doubtless, give place to modern designs in due course. Early-flowering chrysanthemum and November varieties grown in free bush form—a very popular method in the Birmingham district, and bouvardias, planted out in frames, give further evidence of the love of flowers at Harborne Hall, and also of the skill of the gardener.

Queen's Park.

Since Queen Victoria opened Aston Park to the public in 1858, the parks and open spaces of Birmingham have increased largely in number, extent, and beauty. Calthorpe Park was opened the year previously, but Queen's Park, at Harborne, is one of the smaller and most recent additions to the city's playgrounds. It is about fifteen acres in extent, and was opened in 1898. It is essentially a playground or recreation ground, and ample provision is made for the children and young people to enjoy themselves and play games.

But Queen's Park is not without its horticultural features. It has many fine trees and hardy flowers, but the great attraction is the display of summer bedding. Just inside the main entrance is a pretty cottage that is the residence of the foreman in charge, and behind this are several excellent low greenhouses, admirably adapted to the cultivation of bedding plants. Immediately in front is a well-kept lawn enclosed by a low wire fence or edging, and here there are several flower beds that are annually filled with plants that yield beauty of flower or leafage. In addition to the flower garden on the lawn, the border on the other side of the pathway also serves to provide a bright display. Here, last summer, fuchsias were a great attraction, the tall standards of many varieties being a conspicuous success. Calceolarias, ageratums, nicotianas, lobelias, and Paul Crampel and Flower of Spring pelargoniums were also used freely and effectively in this same long border.

In the flower garden proper the effect was not spoiled by the creation of a large number of pretty beds. One big central bed formed the great feature, and the other beds were quite subsidiary, and merely helped to form a setting to the chief effort. As so many readers have the work of summer bedding in full view, it may be as well to describe this big bed at Queen's Park. In outline it is like five circles linked together, the three central circles being larger than the two end ones, and raised higher. The circular portions were filled with pelargoniums. Paul Crampel was used in the central circle, and Universe in those on either side of it, while the end circles were planted with Mrs. Quilter. Verona was the variety used to fill the links between the outer circles and those filled with Universe. The portions of the bed that linked up the three chief circles were filled with Flower of Spring, and some fuchsias. The edging for the whole display was blue lobelia.

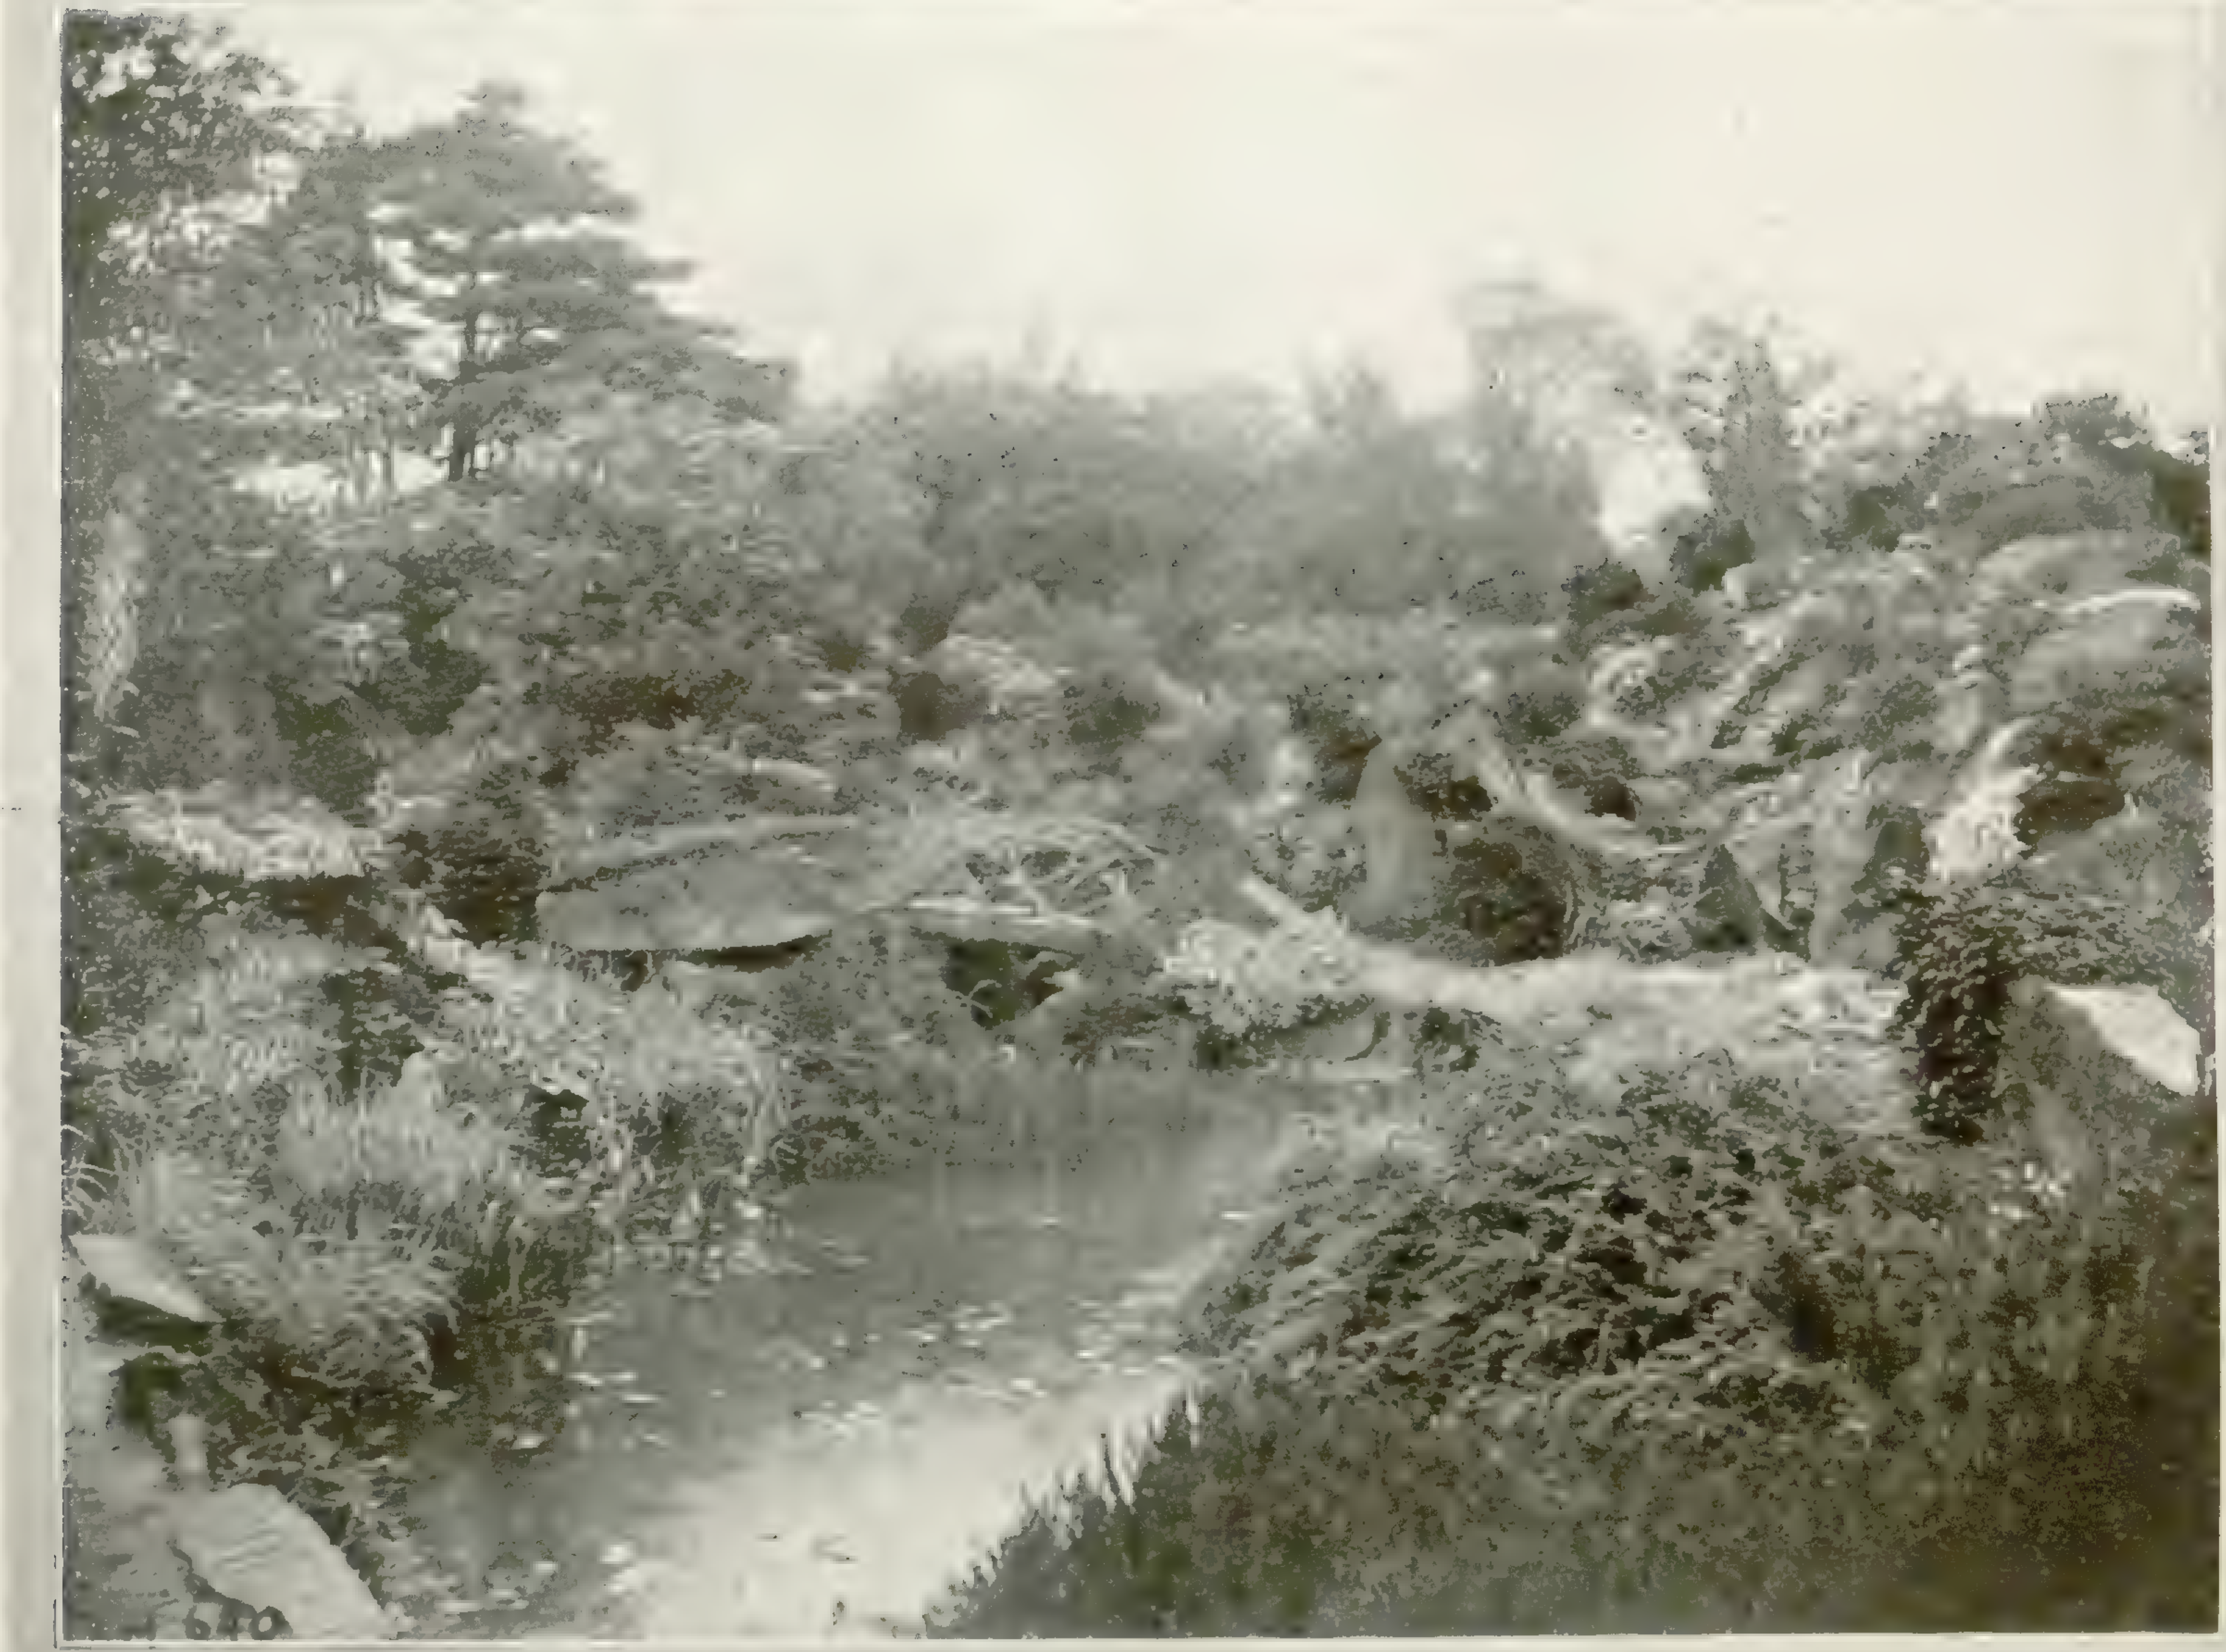
It will be seen that there was nothing very elaborate in such a bed as this, no complicated design or uncommon plants. The effect was particularly good, and one had only to stand by for five minutes and listen to the expressions of pleasure that fell from the lips of a continual stream of admiring visitors, to discover how deep-seated is the love of summer bedding, and how great is the attraction that plants and flowers pleasingly associated and well grown can provide.

Charles H. Curtis.

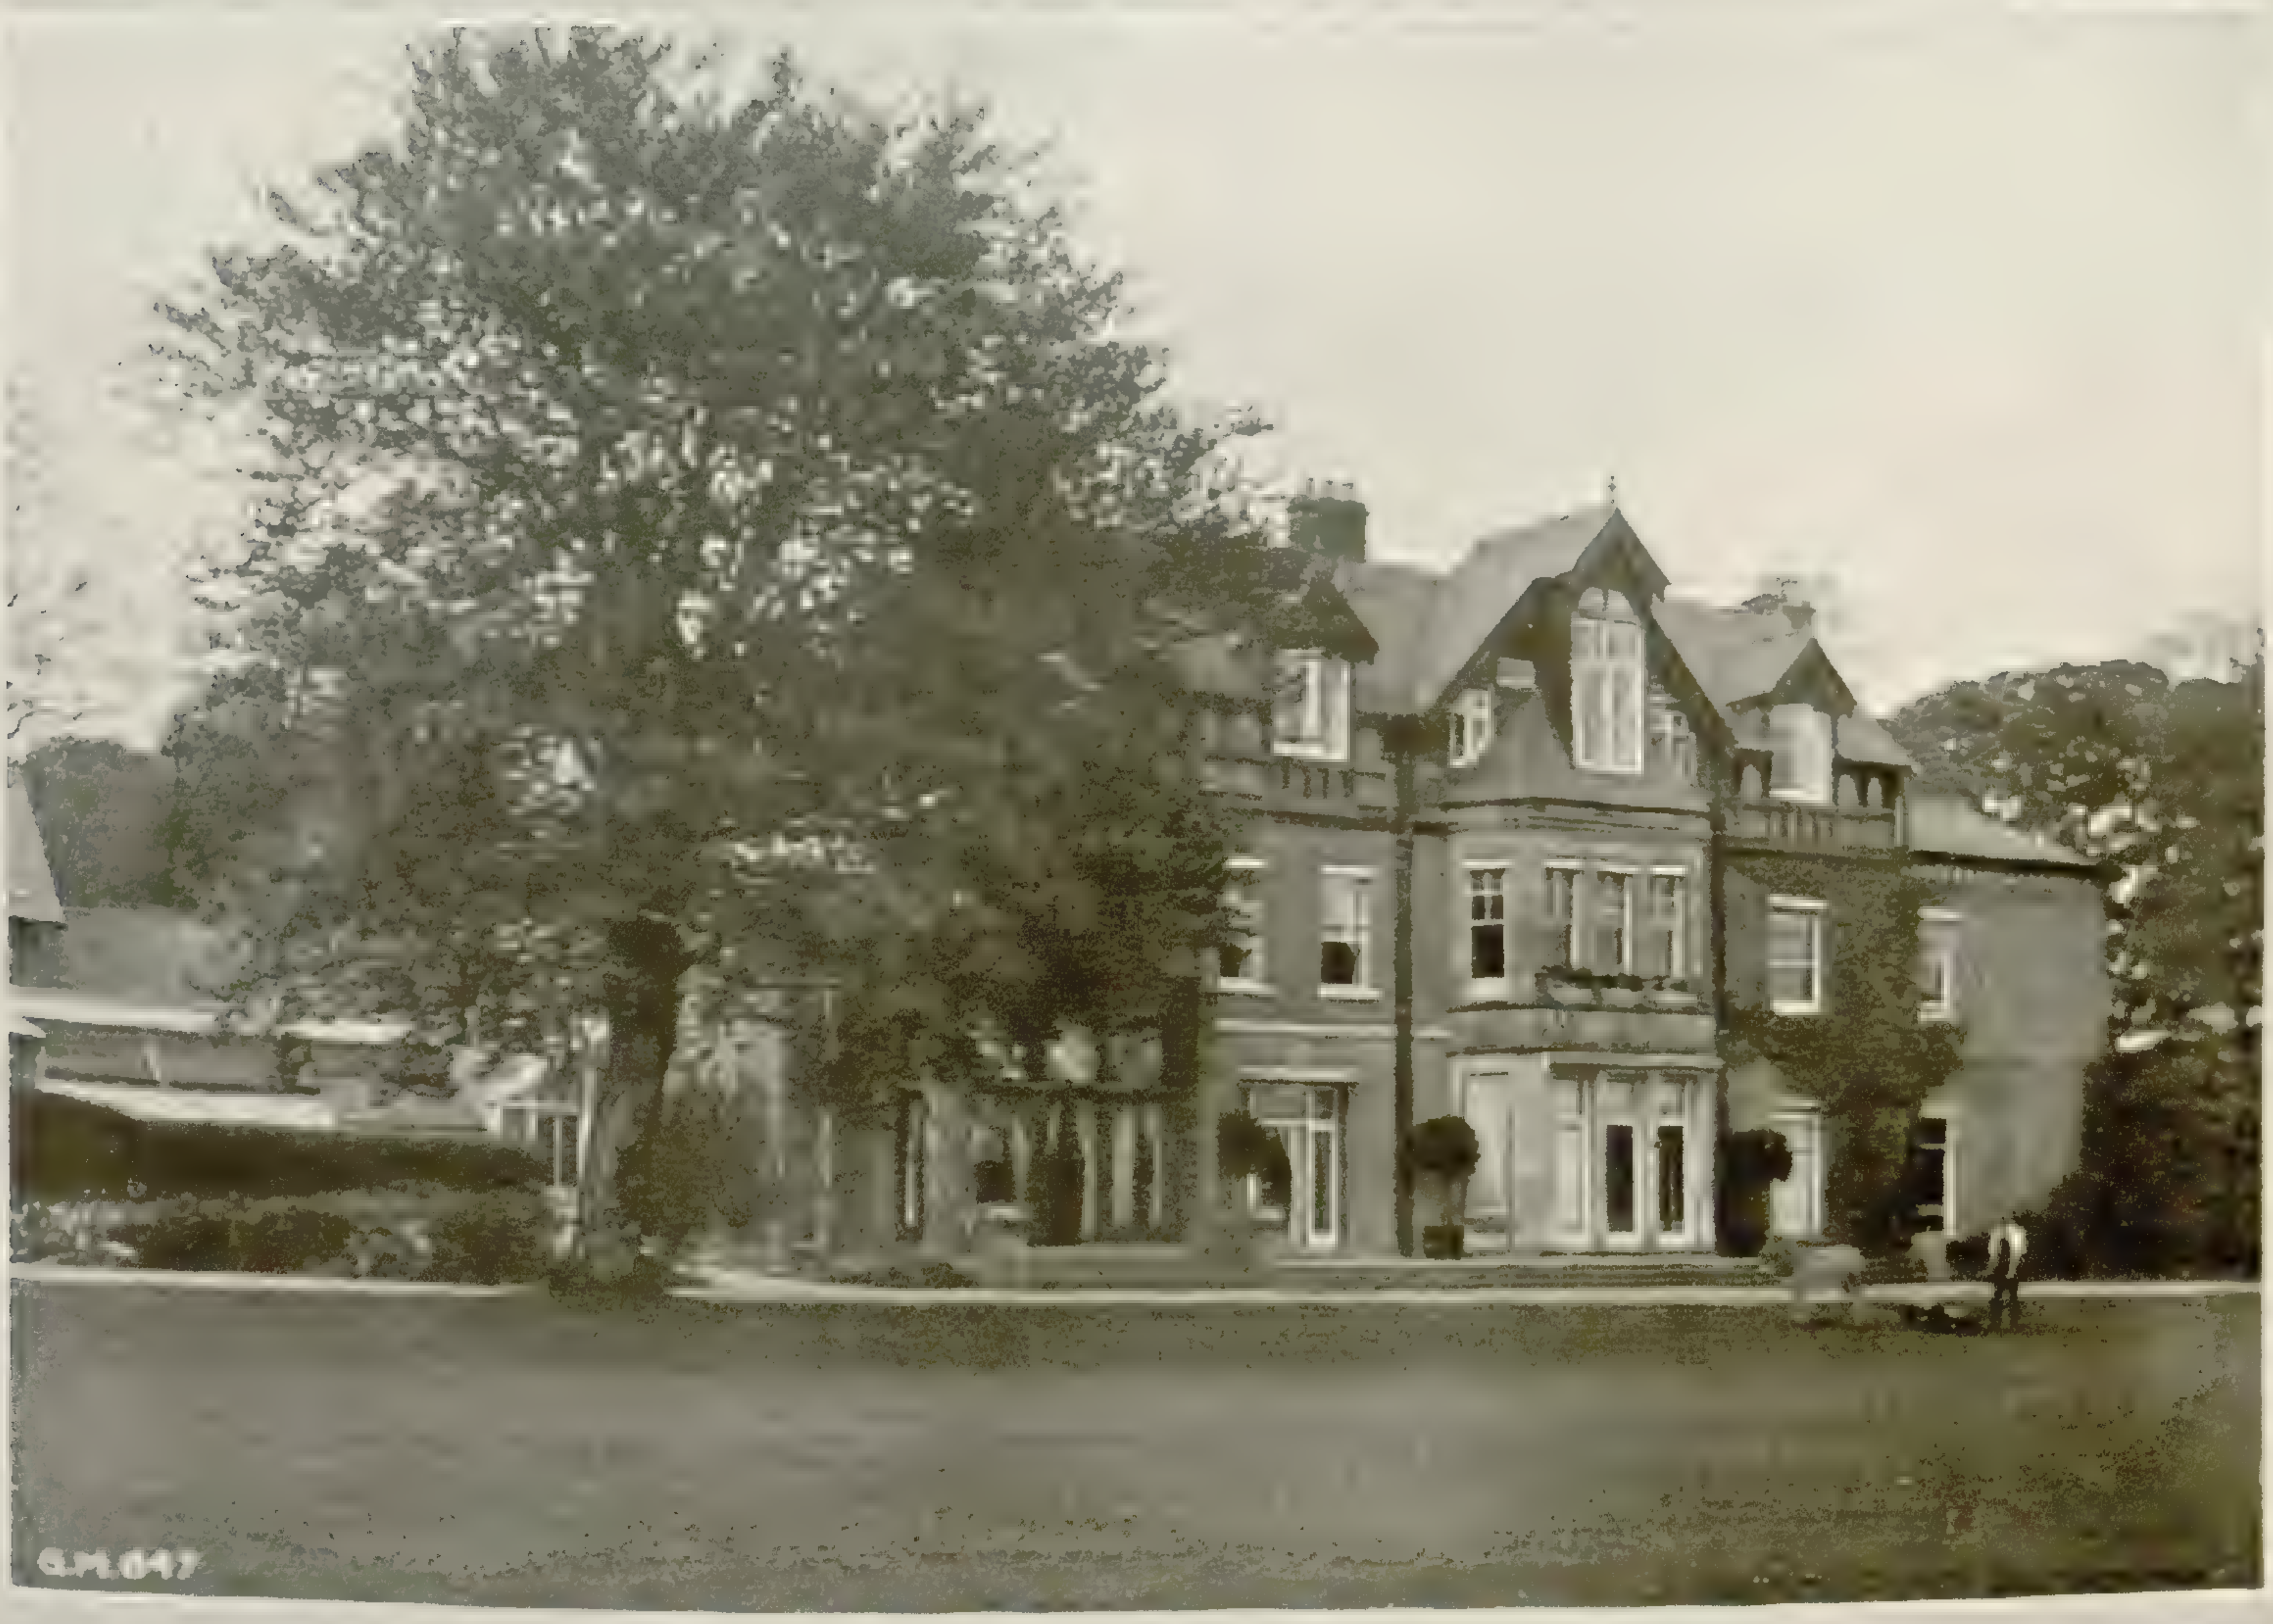
⁂ The second article on "Some Birmingham Gardens" will appear in our next issue.

WATER LILY POOL, BOTANICAL GARDENS, EDGBASTON.

Gypsophila paniculata fl.-pl. as a Cut Flower.—The double form of Gypsophila paniculata has now been before the public for several years, so that in no sense can it be considered premature to offer an opinion upon its usefulness in the garden. In the first place, the growth is quite as hardy and vigorous as the parent, while the branch system undergoes the same perfect development, building up a huge, ball-like mound of slender stems, which terminate in countless blossoms. Except for the fact that these are so small, the doubling is in no way disadvantageous, as they can be employed in the same free manner as the type. The greatest advantage, however, lies in its lasting quality in a cut state, and as it always blooms later than the type, it must, in this respect, inevitably occupy a position of preminence in the garden. In most gardens the call for cut flowers is always great, and as this type of plant is extremely limited, gardeners should early recognise its distinctive merits, and at once include it in their charge. Perennial gypsophilas are essentially limestone plants, retaining their vigour year after year with indifferent attention when planted in soil largely composed of chalk, and where this is absent crushed limestone or old mortar rubble can be used.—Thomas Smith.



VIEW IN THE ROCK GARDEN, BOTANICAL GARDENS, EDGBASTON.



HARBORNE HALL.

LILIUM TESTACEUM.

A favourite and extremely useful lily for the border is Lilium testaceum, sometimes called L. excelsum and L. isabellinum, the latter name being applied from the colour of the flowers, which is of the tint of yellow or nankin called Isabel. It is understood to be a hybrid between L. candidum and L. chalcedonicum, the Scarlet Turk's Cap lily, and in form it takes after the latter parent, the flowers being recurved like those of L. chalcedonicum and others of its class. When well grown, it is a very stately lily, and I have seen it as much as six feet high—although in poor soil it may not be more than three, especially when it has not been long established. When five or six feet high it is very fine indeed, with its pretty leaves and its tall stalk bearing a number of these nankin-coloured recurved flowers.

I have in my mind's eye as I write two long borders in an old garden which I have not seen for years, in which there were many plants of this Nankin lily. At intervals, at the back of these borders, were groups of the lily, breaking the lines of delphiniums and other tall border flowers; and in summer, when the lilies were in bloom, the effect was superb, especially towards evening, when the colours of the flowers seemed more in harmony with the fine surroundings of old trees, old hedges, old turf, and old-fashioned flowers, which constituted the setting of these gems of the garden. Since then I have seen Lilium testaceum in many gardens, and it ever remains with me one of my favourite flowers—a preference increased by knowing that it is one of the easiest of all lilies to cultivate.

It was with some surprise and fear that I learned some few years ago that it was subject to the same diseases as one of its parents, Lilium candidum, the charmingly pure Madonna lily, whose exquisite purity is so pleasing to everyone. It seems to me, however, that this disease is not very widely spread, as, frequently as I have come across L. testaceum, I have never seen it attacked by this pest. I am thus led to conclude that it is less subject to it than has been asserted, and this is partly borne out by the knowledge that in the old garden to which I have just referred the Madonna lily was very subject to this disease, while Lilium testaceum seemed quite immune.

Like quite a number of other lilies, L. testaceum seems to enjoy the cool atmosphere of the North, and in many Scottish gardens, it is exceedingly fine, even where it receives the minimum of care. Then it is also less injuriously affected than some lilies by the presence of fresh manure in the soil, and I have been amazed at its indifference to the somewhat rough treatment I have seen it receive. I know a garden where it and other border flowers were lifted every two years or so, just after the potato planting time, when the garden was receiving its annual overhaul. The border was thoroughly manured with almost fresh, steaming horse-manure, and the lilies replanted without any detriment to them—nay, one would rather say, with a distinct improvement to their vigour. This somewhat unorthodox treatment—for even the manure was unorthodox, cow-house manure being the orthodox prescription—was followed for years with excellent results, and the plants gave strong, vigorous leaves and stems and large flowers of great substance.

A good loam is a soil which suits this lily well, but I have seen it flourishing under the most diverse conditions; here in good garden loam; there in poor and sandy soil; and there, again, in stiff clayey loam. It is, in brief, one of the most accommodating of lilies under varied conditions. As regards the situation, I have seen it do splendidly in such positions as among shrubs, but I have also observed that it flourishes in the sun equally well, so that the statement that this is one of the most accommodating of garden lilies holds good in connection with situation as well as of soils. Thus those who wish to cultivate it need not hesitate to attempt it, as they have every prospect of success.

It is also an excellent pot lily if treated in the ordinary way adopted for such lilies as Liliums auratum, longiflorum, and other favourite lilies cultivated in this manner.

For planting outside I generally recommend a depth of from nine inches to a foot as the best depth to plant, but in pots about four to six inches is a better depth. It is unfortunate that the deep pots which are most suitable for lilies and some other bulbs are not stocked by many seedsmen, as they are by far the best for such plants as Lilium testaceum. I have practised with considerable success in growing this and other lilies in pots a plan I once read of years ago. This was to smear the inside of the lower parts of the pots, i.e., at about the level of the base of the bulbs, with fresh cow manure. This did not, of course, come in contact with the bulbs themselves, but the roots had access to it, and it was wonderful how they seemed to find their way to the manure and apparently to enjoy the strong feeding. This but confirms the belief that this and many other lilies do not object to some manure within their reach, but not in direct contact with the bulbs.

Propagation of L. testaceum is effected by means of division of established clumps of bulbs, and also by means of scales, but the latter method is not a convenient although an interesting one, for the amateur with little space and little time to spare for work of this kind. L. testaceum is not expensive, and a bulb or two will form a good nucleus of what may in due time prove a large stock.

S. Arnott

WATER GARDEN AT HARBORNE HALL.

LINARIAS.

Linarias are not usually regarded as typical garden plants, though for decorative effect they leave but little to be desired. Though, however, it is usual to exclude the majority of them from the garden proper, there are few groups of plants which are better adapted for certain purposes in garden adornment. I am speaking in reference to their value for the rock garden and the wild garden, for in these places the linarias are at home, and one can keep their somewhat aggressive tactics under control.

They are certainly aggressive, and with their creeping, fleshy roots and their prodigal distribution of seed, they may be deemed invaders in the fullest sense. Though, of course, this roving freedom necessitates a certain amount of watchfulness if there are choice plants in their vicinity, yet one would not deny them this characteristically invasive disposition. On the contrary, this delightful freedom of growth and prodigality of blossom endears the whole group to those who desire "natural beauty," especially in reference to the wild garden.

One has only to recall the delightful grace and the attractive sulphur and orange colouring of our common Linaria vulgaris to be assured of the beauty of the whole group. One can often meet with L. vulgaris in out-of-the-way hedgerows in August, growing three to four feet high, and forming a veritable "picture" with its dainty spires of blossom.

Naturalised in extensive groupings this linaria will give pleasing effects, and in conjunction one could also utilise other of the finer tall linarias, such as L. dalmatica—an exceedingly good plant and very lasting in blossom; L. genistæfolia, a light habited, pale yellow gem; L. macedonica, probably a variety of L. dalmatica, from which it differs in its deeper hue and broader foliage; and L. purpurea, a rich purple-coloured species, with a light, graceful habit, which contrasts splendidly with the sulphur and gold of the other species. Linarias revel in a fairly good retentive soil, and in a sunny situation will not fail to produce a "very riot of beauty." They often do well in a shady position, but the wealth of blossom is considerably curtailed.

Linaria alpina is one of those exquisite rock plants which blossom over a long period and never appear weedy. I recollect an old time garden where this species had taken full possession of some old stone steps, and certainly the tiny grey-green leafage, with their tiny culminating spikes of purple-blue and orange blossoms, roving out from the crevices between the stones, made a very pleasing effect. I would advocate the merits of L. alpina, and more especially its charming varieties rosea, a soft rosy pink of exquisite appearance, and alba, a rarity in white, the three forms being extremely valuable for the embellishment of the rock garden.

L. pallida is a favourite in many quarters, and makes spreading mounds of greenery, which are gemmed in summer with dark lilac blossoms. A somewhat uncommon purple variety of pallida was noted at Kiln[illegible] Gardens last summer, and gave one the impression of being a pleasing addition to the rock-garden linarias.

A plant that should on no account be left out of the rock garden is L. repens alba, which produces an abundance of dainty flower-clad growths, which are graceful in appearance and wonderfully fragrant. These tiny linarias, L. pilosa and L. hepaticæfolia, are splendidly adapted for shady nooks and crevices, and may also be used as carpeting plants around taller subjects.

Of the other rock linarias one would not miss L. cymbalaria, the Kenilworth ivy, which is so well adapted for streaming down from the crevices of old walls. Its principal variety alba, a white counterpart of the type, is also of service in the direction noted.

Others might also be utilised, and among them L. anticaria, a beautiful variable species; L. origanifolia, blue and gold in long racemes; and L. italica, a floriferous white, are worthy of notice.

One might indeed profitably include a selection of linarias in rock and wild garden plantings. P. S. Hayward.

JERUSALEM ARTICHOKES.

These are most valuable to the gardener who has to supply large quantities of vegetables through the whole year. The Jerusalem artichoke (Helianthus tuberosus) is available for the table about the middle of October, and gives a continuous supply till the latter end of March. Then there is the Chinese artichoke (Stachys tubifera), which is a small, wrinkled, tuberous-rooted plant that makes a most acceptable dish, and is a useful addition to the vegetables, available in its season. This may be used from about the same time as the Jerusalem artichoke, but after December it becomes a little too sweet, and is therefore not much in request.

To many it may appear that the Jerusalem artichoke is inferior to the potato in nutritive quality, but analysis shows that the tubers are inferior in but a slight degree; and when properly cooked and served, a dish of artichokes is very agreeable. When potatoes are of indifferent quality, which very frequently occurs, a store of artichokes becomes invaluable. Where the slightest knowledge of cookery exists there is no difficulty in serving them up in a most tasty manner. As regards cultivation, the Jerusalem artichoke is often left alone in some out-of-the-way corner to take care of itself. But if systematically cultivated, it is as easily and cleanly forked out of the soil, when ready, as is the potato. It has a great advantage over the latter, for its tubers will stand any amount of frost without the slightest injury.

ROSE PERGOLA, HARBORNE HALL.

The tubers of the Jerusalem and Chinese artichokes could be left in the ground if necessary all winter, but it is far the best method to dig up a quantity and store in ashes or sand, so that they may be easily obtained when required during hard frost without much trouble. These two latter kinds are extraordinary croppers, and free from any kind of disease, so an abundant supply is certain, with but litle trouble in the preparation of the soil, and even without the application of manure.

As before stated, the Jerusalem artichoke will thrive in any kind of soil and in almost any situation, but to grow it well, and of nice flavour, a good deep sandy loam is required and an open, sunny position. The ground should be well trenched in the autumn, so that the frost may have full effect on the soil, which will make it better for working. The best time for planting is in February and March. Choose moderate-sized tubers, and plant them 18in. apart from each in rows with 2ft. spaces between them. The tubers will soon grow on and take care of themselves, the growths running up in some seasons from 10 to 12ft. high; consequently, if there is any unsightly wall or buildings in the garden that it is desired to block out, these are most useful.

To obtain good-sized tubers, it is necessary to plant a quarter every year, and if in very exposed situations some support will have to be given to the growths to prevent their being broken by wind. Strong twine fastened to poles driven in the ground will answer very well. Watering or mulching is not required, except on very poor, shallow soils, when a mulch may be applied or water given with advantage.

T. W. Birkenshaw.

Hatley Park Gardens.

Walnuts.—These are generally much appreciated, but very little attention do the trees receive in a general way after they become established. Yet large trees are much improved, and the fruit enlarged, by having the soil over the roots kept open, and by an annual dressing of manure placed over the surface during the winter.—Geo. Woodgate, Rolleston Hall Gardens.

GARDEN DAHLIAS.

The following is the substance of the address given by Mr. George Gordon, V.M.H., at the meeting of the National Amateur Gardeners' Association on the 2nd inst.:

It cannot at the present time be said that dahlias enjoy a high degree of popularity, or indeed, the popularity their merits would warrant. They are annually grown in large numbers, and they have their admirers; but they seldom give rise to any considerable degree of enthusiasm. Knowing the present state of feeling with regard to dahlias, Mr. Gordon said he would certainly not have suggested a talk about them had he desired to obtain a little applause, but rather would have recommended an address on roses or some other class of plants that are so highly esteemed that one can be sure of obtaining hearty response when speaking of their usefulness, and the charming effects they are capable of producing. His object, he said, in selecting garden dahlias for his subject, was to endeavour to show that dahlias can at a small expense, and without any special difficulty, be made to contribute materially to the attractions of the flower garden during the greater part of the summer, and at a time when many of the flowers belonging to that season have lost their freshness and beauty.

In acknowledging the fact that dahlias do not enjoy a high degree of popularity, it was desirable it should be carefully considered why they fail to be regarded with the favour justified by their merits. They are, it is true, not distinguished by their fragrance as in the case of roses, carnations, and some other flowers that could be mentioned, but they are free and continuous in flowering, the blooms are highly diversified in form and varied in colour, and the hues are all more or less attractive. Dahlias are at the present day suffering appreciably from the raisers having regarded them more as flowers for the production of colour displays on the exhibition stage than as flowers for beautifying the garden. Cultivators have also helped to hinder dahlias rising to the position they should occupy in public estimation, by failing to differentiate between the course of procedure desirable in the production of exhibition blooms and the practice by which the most satisfactory effects can be obtained in the garden.

There is nothing new in this. For more than a hundred years raisers have constantly had their attention directed to the exhibition side of dahlias, and been striving to produce plants bearing blooms remarkable for their large size and perfect form, as judged by the standard of the day, instead of building up plants of neat habit, profuse in flowering, and bearing their blooms on stiff stalks well above the foliage. For more than a hundred years writers on dahlias, in dealing with their cultivation, have shown remarkable unanimity in recommending, whether the plants were intended for the production of individual blooms of exceptional size, or for garden decoration, a course of procedure only adopted for the first-named purpose. A stock phrase was, and still is, "As the dahlia is a gross feeder, the ground, in being prepared for them, should have a heavy dressing of manure."

One hundred and ten years have elapsed since the dahlia was introduced to Europe from its Mexican home. But it was not until 1815, when plants were obtained from France, that it was really established in this country. Immediate attention was directed to the raising of new varieties, and these were multiplied at so rapid a rate that fifteen years later there were several hundred named varieties in cultivation, and numerous exhibitions were held annually. These exhibitions created an immense amount of interest, certainly not less than that associated with the chrysanthemum shows held twenty years ago, and this interest was maintained until quite the middle of the last century. Single flowers were not appreciated in the earlier days of the dahlia in this country, and all the raisers did their utmost to obtain double flowers of a perfectly symmetrical form. It was from the earliest introductions that the show and fancy varieties originated.

These latter have throughout their history been so closely associated with the exhibition stage that they have not been regarded with much favour for garden decoration. They are, it must be admitted, not all that could be desired from an artistic standpoint, but when grown under a course of procedure adapted to the production of firm, short wood and medium-sized leaves, the growth will be compact, and the blooms will be borne in profusion on stiff, erect stalks, well above the foliage. When, on the other hand, manure from the stable or farmyard is applied in excessive quantities, as so generally advised, the growth will be so luxuriant as to hide the comparatively few blooms produced, and these will be so heavy as to hang down instead of standing erect.

Pompon dahlias, which made their appearance in this country about the middle of the nineteenth century, are of German origin. These have undergone an immense improvement, both in habit and in the form of the flowers, and are so neat in growth and free in blooming, as to be of much value for garden decoration. The height is about three feet, the growth is compact, and the blooms, standing erect, well above the foliage, produce an excellent effect. The latter afford a wide range of colour, and although distinctly formal can be employed with good effect in floral decorations. The plants should be arranged about thirty inches apart each way.

The cactus dahlias, it was pointed out, have, during the past quarter of a century, occupied a large share of attention, and, notwithstanding the energies of the raisers, they have failed to realise anticipations with regard to their value for the garden. It was supposed in their earlier days that they would become essentially the dahlia of the garden, but, with few exceptions, they have proved most disappointing. Dahlia Juarezi, the progenitor of the cactus varieties, was sent from Mexico to Holland in 1872, and eight years later was introduced to this country. The distinct form and the brilliant colouring of the blooms soon obtained for the species a large share of attention, and the raising of seedlings was entered upon with much zest. Here, as in the case of the show and fancy varieties, the mistake was made of regarding the cactus dahlias almost entirely from the exhibition standpoint. Growers based their estimates of the merits of varieties upon individual blooms, and purchased novelties in accordance therewith. Raisers naturally endeavoured to obtain varieties with flowers large in size, elegant in form, and resplendent in colour, for which there was the strongest demand. They achieved much success in the production of flowers of what is popularly known as exhibition quality. But, unfortunately, little attention was paid to the habit of the plants, and, as a consequence, large numbers of varieties were introduced that have proved unfit for the garden, and have set back the cactus dahlia considerably in public estimation. The growth of a very considerable number of the varieties make so robust a growth that the blooms are quite hidden, and those who grow them have huge masses of leaves, among which may be found a few finely-developed blooms, instead of masses of blooms relieved by a moderate amount of greenery.

Societies have much to answer for in making awards exclusively to specimen blooms without regard to the habit. This fact is now acknowledged, and it is satisfactory to know that an endeavour is being made to effect an improvement, and bring into prominence varieties that are really suitable for the garden. The Royal Horticultural Society has during the past three years held trials of cactus dahlias in the Wisley Gardens, with a view to determine their merits for garden decoration. The National Dahlia Society, with which has been incorporated the London Dahlia Union, will continue this good work. Under the altered state of things it is hoped that within the next few years an immense improvement will be effected on the lines indicated. To the grower for exhibition the habit of the plant is a secondary consideration, but to those who plant dahlias for beautifying their garden it is of the utmost importance.

The following cactus varieties, as proved by the Wisley trials, and recorded in the R.H.S. "Journal," are well adapted for the garden: A. D. Stoop, light crimson; Avoca, rich carmine; Brightness, carmine-red; Crepuscule, salmon-buff; Flash, scarlet; Florence Stredwick, white, with cream-coloured centre; J. H. Jackson, deep crimson; Lustre, light carmine; Miss Willmott, yellow, shading to soft salmon; May Carpenter, mauve-pink; Mrs. Charles Scott, yellow; Molly, yellow, suffused buff; Mont Blanc, white; Primrose, pale yellow; Stalwart, deep yellow; and West Hall Scarlet, brilliant scarlet.

Of quite recent introduction are the paeony-flowered dahlias, which were introduced to this country from Holland three or four years ago. These are strong in growth, but they are free in blooming when excessive manuring is avoided, and very attractive. The flowers are of large size, single and semi-double, and have broad florets. They are best suited for large beds and borders, and should not be planted extensively by amateurs who have but little space at their command. The flowers do not retain their freshness long after having been cut, and, consequently, are not very useful for indoor decorations. The following were mentioned as including a few of the best: Baron de Grancy, white; Duke Henry, red; Garabaldi, scarlet; Dr. Van Gorkom, white, shaded rose; Glory of Baam, pink; King Leopold, yellow; Queen Wilhelmina, white.

Single dahlias do not enjoy a very high degree of popularity at the present time, although they include several varieties possessing much beauty. D. coccinea, a single variety, with scarlet flowers, was one of the first dahlias introduced to this country at the beginning of the nineteenth century, but it appears to have been lost. It was re-introduced in 1880, with two or three other singles From these have descended the varieties now in cultivation. When well grown they possess considerable beauty, but, unfortunately, the flower heads have a rather unsightly appearance when the florets have fallen.

There was not, in Mr. Gordon's opinion, any occasion for referring at great length to the cultural details, because of their extreme simplicity. Sunlight and air were important factors in dahlia culture, and therefore open positions should, where practicable, be selected. The ground should be trenched or deeply dug to give the roots a free run, and a moderate application of manure should be made and well incorporated with the soil. The quantity of manure must be regulated by the condition of the soil. That which is poor and light should receive a more liberal application than one that is rich and retentive. In no case must the heavy dressing usually recommended be applied.

A simple course of procedure in raising a stock is to take the roots from the store at the end of February or early in March, and stand them in boxes, over the bottom of which a layer of light soil has been spread. Then fill in the spaces about the tubers with fine soil in sufficient quantity to reach to the base of the old stem. Placed in a frame or greenhouse, and lightly syringed once or twice a day, they will soon commence to make new growth. When the shoots are three inches in length, lift them out of the box and divide them into two or more portions, each with a shoot attached, and pot them in six-inch pots, using a moderately rich compost. As the young plants are potted place them in a frame where they will be near the glass and can be kept safe from frost.

If a stock has to be purchased, obtain the plants not later than the end of April, and at once shift them into six-inch pots, this being necessary to enable them to acquire strength by the end of May, when they should be planted out. Our summers are short that it is most important the plants should be strong and in a progressive state when bedded out. The necessity for strong plants could not well be over-emphasised, because of the failures to obtain a full measure of success from bedding out plants of so small a size, that the summer is well advanced before they approach the flowering stage.

TOWN GARDENING.

Having been engaged in public work for upwards of eighteen years, it naturally follows that Mr. Hayward's letter, in a recent issue was of much interest to me, and doubtless to everyone similarly placed.

I, or we, are grateful that he has taken up the cudgels on our behalf, and while nothing but good can accrue from honest criticism, I hardly think that Mr. Maurice Maeterlinck can have, or possess, a very wide knowledge of town gardens as they exist in this country. It is not a difficult matter to pass hasty judgment after having observed a score of villa gardens, and it must be remembered that men with big names and reputations often feel at liberty to express themselves very freely upon any subject under the sun, but it proves nothing. Would Mr. Maeterlinck propose to abolish the lake in Kew Gardens simply because it is an artificial one, and are we to believe that the lawn is not a very beautiful accessory to any garden?

Cavilling at the setting aside of a portion of a town garden to accommodate the "everlasting flower beds" cannot be taken seriously, more especially as they are planted and arranged to-day, exhibiting in a very marked degree a sense of harmony and artistic perception. As a people we are not likely to substitute the present style of gardening for the Italian pattern, and, further, it would be a very lame affair to attempt "the very forest itself" in small gardens. Where can we find more stately and majestic trees, and their name is legion, than those in our London parks and gardens, and the great provincial towns are not far behind in this respect. Mr. Hayward truly remarks that the town gardener is placed at a very great disadvantage in every way, not the least being his inability to cultivate successfully more than a very limited number of trees, shrubs, or flowering plants. The smoke and atmospheric impurities account for this, hence it behoves us, in catering for the public, to do everything in our power to make the best possible use of subjects that, to a great extent, ignore the unfavourable conditions, and, in these enlightened days every encouragement is given by the responsible authorities.

The district from which I write is a purely industrial one, and nothing has given me greater pleasure than to note the intelligent interest displayed by horny-handed men of toil in plant life generally. One specialises in dahlias, another lilies, and so on, as far as circumstances permit, and in offering information, and doing everything in my power to foster and encourage the practices of the gentle art. I fully recognise the fact, that the person who takes up gardening as a hobby, no matter whether the plot does not exceed 2ft. by 12ft., is almost invariably a steady and law-abiding citizen.

Mr. Hayward suggests the planting of limes, chestnuts, and roses in town gardens and streets, which leads me to say that the above-mentioned would prove an utter failure in such congested parts as Bermondsey or Shoreditch, while at Dulwich, Highgate, etc., they would be a huge success. It is impossible to treat the matter in a general way. In conclusion, I may refer to a letter which appeared in a London daily some time ago, in which the writer stigmatised gardeners as being an inferior race of men, making use of long names they knew nothing about, and could not even pronounce correctly, etc. I suppose that writer has to do something for a living, but one thing is certain, his knowledge of gardeners is confined to the individual who cuts his grass patch once a week.

Walter H. Aggett.

SOWING SEEDS.

Now is the time when many choice seeds may be sown; begonias, gloxinias, and other subjects that are to flower this season should be sown at once. In districts where fogs prevail it is not safe to sow much earlier. The prevailing idea with many is that all seeds should be well shaded until they germinate, and under this treatment they undoubtedly do start better, but often they are lost after they have germinated. I am fully convinced that almost all seeds should be exposed to the light, and certainly many do not require shading from the sun at this season of the year. If a little extra care is given until the seedlings are large enough for pricking off, those fully exposed to the light will make sturdy plants, and quite as large a percentage of seed will grow.

It is of great importance that moisture should be sustained, and when well exposed there is not so much danger of the soil becoming sour. When preparing the pots for very small seeds, the surface soil should be sifted through a fine sieve, and after the seeds are sown they may be lightly pressed down, but no covering should be given. Good drainage is very often advocated, but I prefer a good depth of soil, as it can be kept moist with less trouble. Drainage is of more importance when preparing the pots for pricking off the seedlings.

For all seeds that require a surface covering care should be taken that the compost is not inclined to cake after it has been watered. It is sometimes caused through pressing it down too firmly. A little dried sphagnum rubbed through a fine sieve is a good addition to the compost, as it prevents caking and holds moisture as well. For seeds of primulas, cyclamens, etc., sphagnum and sand only should be used for covering. Many seeds will germinate better and more evenly if soaked in water for a time before sowing. The period of soaking will depend upon the nature of the seeds. Cannas, acacias, and other hard seeds may be kept in water for some time, but the water should be changed, and when the seeds have begun to swell they may be sown. In no case should seeds be allowed to become dry after they have been soaked. One great advantage in soaking seeds is that they do not lie dormant so long and are less liable to damp off, as the soil does not have time to get sour. If a little more care and judgment were exercised in sowing seeds, there would be fewer complaints about inferior seeds being supplied by the seedsmen.

T. B. Field.

Ashwellthorpe.

Imantophyllums or Clivias are very easily-grown greenhouse plants, and when grown in 32-sized pots are very useful for the decoration of the conservatory. Plants that have been forwarded in a warm house will now be going out of flower, and if it is desired to increase the stock, they may now be split up to single crowns and repotted, using a compost of loam (fairly stiff), leaf-soil, and sand, with bonemeal added. I usually put them into 48's for the first season, and if properly treated they will flower in these pots the following spring, and they are afterwards transferred to large 32's. After potting they should be placed in an intermediate house, where they can have daily syringings until root action commences again. Plants that are pushing up their spikes should be liberally fed with liquid cow manure, and occasionally given a little artificial manure, as this adds greatly to the size of the bloom and colour of the foliage. —T. Stevenson.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLING ODONTOGLOSSUMS.—To incorporate the treatment of seedling odontoglossums in the work of the week column I feel has become necessary. Very few, if any, of the prominent orchid specialists who, like myself, have been writing on these subjects for a number of years, could have anticipated a few years ago the possibility of such a requirement. Orchid hybridisation, though still in its infancy, has made such rapid progress, and the interest shown in this fascinating subject in practically every garden in which orchids are extensively grown, render it desirable that occasional reference be made to the details in this column.

ODONTOGLOSSUM SEEDLINGS which we once found so difficult to raise, are now procured as easily as those of any other genera of the orchid family. I have seen no advice offered elsewhere as to their general treatment, so that a brief outline of the requirements may be of service. Plants that have advanced to, say, the third leaf from the seed, will be found to produce roots very freely, and little difficulty is experienced with their advancement when they have reached this stage. The plants in this stage of development will now be more or less in an active state, and as the aim of all raisers is to diminish as far as possible the length of time between the sowing of the seed and their reaching the flowering stage, it is advisable to give treatment accordingly. With this aim in view, we may consider these orchid seedlings in the light of seedling plants of other genera of the vegetable kingdom, and as the aim is to frequently shift and pot them on as their requirements demand, so we must practically follow the same rule in growing on our orchid seedlings. It is not a bad plan to shift or pot on odontoglossum seedlings as soon as the roots have penetrated the potting compost, in their early stages of development. It is useless to state what size of pots should be used, as no practical end can be served; those who are dealing with the plants are in a better position to judge, and thus should use their discretion.

REPOTTING.—There is one rule which should be applied in all cases, and that is to see that liberal drainage is afforded. It is a good plan to place a crock over the hole at the bottom of the pot, and to fill to at least one-half the depth with well-dried chopped bracken roots. The potting compost may consist of about equal portions of finely chopped sphagnum moss and broken peat, graded according to the size of the pots that are being used. A few broken beech or oak leaves may be added if desirable, or equal proportions of finely chopped osmunda fibre may be included with the peat. Whichever is determined upon, sufficient sand or finely broken crocks should be added to keep the compost porous. Water with rain water as soon as repotting is completed.

Plants that have reached the stage of the seedling growth, where they commence to develop their first pseudo-bulb, are generally found to be in an active rooting state, and these should also be attended to at this season. It is well to have the repotting of odontoglossum seedlings done as early in the season as possible, as it enables them to become re-established in the new compost before the hot summer season arrives. There is nothing more trying to young odontoglossums than the hot, dry summer season.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

HANGING BASKETS.—Nothing adds to the elegant appearance of the conservatory or greenhouse more than well-furnished hanging baskets, and, if suitable places can be found for them until they are nicely furnished, nothing will more amply repay the time and trouble taken. The present is a very suitable time to furnish these baskets, as many of the young plants with which they may be filled will be well rooted. The baskets themselves are now made much plainer than they used to be, with the wires much closer together, and they are consequently stronger. This is an advantage, as they keep the moss and soil together better. In making up these baskets they should be well lined with clean moss, on which should be placed flat pieces of fibrous loam or peat, according to the character of the plants used, afterwards filling up with soil of not too porous a nature, as the baskets being isolated will dry more quickly than plants in pots. In addition to the usual ferns (Nephrolepis in variety) that one usually sees, various forms of adiantum may be used with advantage, as they grow freely, and, when well furnished, give quite a cool effect when hung where they are not exposed to much sun. Various pterises may also be used—in fact, almost any kind of fern will grow better in baskets than in pots, if proper attention is given to watering and feeding. Various greenhouse plants may also be used, the acalyphas being among the best subjects; A. musaica, when used in conjunction with Abutilon Sawitzi and panicum, produces a very charming effect. A. hispida planted in a basket does well, and grown in this manner gives better tails of bloom than when grown in pots. Fuchsias and begonias may be used in conjunction with small grasses or lobelia, and even petunias make a very fine show in baskets, though these latter do not last right through the season. When once the plants are established they will need a liberal amount of water, and after a time liquid manure as well; consequently they must be hung where the drip will not interfere with the well-being of other plants.

LACHENALIAS.—Among the many bulbs that are now making a good show the lachenalias are prominent, and, though not quite so bright in colour as the tulips, they are none the less useful, as their pendulous blossoms last a very long time, and their colouring is quite distinct. L. Nelsoni is perhaps the best kind. Weak liquid manure should be given the plants as they throw up their flower spikes, and should be continued after they go out of flower, to help make good bulbs for the following autumn.

BULBS AND FORCING PLANTS.—Continue to forward batches of these as required, and as many of the forcing plants are now going out of bloom, they should be brought back from the conservatory, have any long, straggly shoots shortened back, and be put into a house where they will receive every encouragement to finish their growth, after which they should be gradually hardened off, previous to being put out of doors. In this way many kinds of forced plants may be kept going from year to year—in fact, many of the prunus, the wistarias, laburnums, etc., will flower better by being kept in their pots. Batches of liliums, such as L. Harrissi, L. longiflorum, and L. speciosum, may now be brought forward to succeed the earlier flowering bulbs, but do not push them along too rapidly, or scantily-flowered stems will be the result. As growth generally is now good, care must be taken to see that insect pests are kept down by occasional fumigations, or, in the case of small batches of plants, by dipping or syringing with some approved insecticide.—Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

DRIVES AND WALKS.—Well-made and properly cared for drives and walks become a pleasure; the present is a capital time for either remaking or renovating these. In the first place it is most important that they be of sufficient width to be in harmony with the size and surroundings of the gardens. The larger and more important these latter are the wider and more bold should the walks be, but either too great a width or too narrow are equally bad. Walks and drives should always be thoroughly drained, with good catchpits at suitable intervals for collecting the water, and the pit should be of sufficient depth to retain a fair amount of sand and sediment, which should be regularly cleaned out. The centre of the walk should be raised just enough to allow the rainfall to drain to the side, but not so as to make it uncomfortable for walking or driving on. When they are sweeping, the men who are deputed to do this work should be instructed to make good any slight depression by utilising the sweepings taken from other parts; the garden roller must be kept well employed all through the year, and especially after rains. The edges of the turf should be neatly trimmed at this season, using a good edging iron for this purpose, and a certain amount of skill is required to carry out this work in a satisfactory manner.

LAWNS.—These are equally as important both for appearance and utility as the walks and drives, and to keep them in perfect order it is often advisable to apply a good dressing of suitable material, either in the autumn or at this season; but, for choice, I prefer to work now. When lawns become weedy and starved they should be thoroughly raked over with an iron-toothed rake, and have a good dressing of road scrapings and well-decayed leaf-soil, to which should be added one of the many manures especially prepared for this purpose. The whole should be spread evenly over the surface and well swept about to work it in; and towards the end of the month a well-prepared mixture of clover and fine grass seed should be sown, and the lawns be kept thoroughly rolled. Where daisies abound and are considered objectionable, these may be successfully eradicated by using lawn-sand. I have on many occasions proved this to be most satisfactory, as it not only kills the daisies and many other weeds, but it also acts as a stimulant to the grass, though for a short time the latter presents a browned appearance.

SPECIMEN CONIFERS.—These, when growing on the lawns, will be much invigorated if a good dressing of loam, well-decayed manure and leaf-soil in equal proportions is applied any time during the next month or six weeks.

MICHAELMAS DAISIES. — These deservedly rank among our most important and effective hardy autumn-flowering plants. The new and improved varieties have done much to stimulate a liking for them, and they are quite worthy of a border devoted to them entirely in a garden of any pretensions. These should be divided and planted a good distance apart, on well-manured ground, at the earliest possible moment.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

FIGS.—The protecting material may now be removed, and the branches fastened into their proper positions, but some mats should be hung over them during the night if frosts are probable, until the trees have become thoroughly hardened again. If the trees were attended to as advised during the past season, in the matter of disbudding the surplus growths, stopping the others as required to prevent overcrowding, also cutting out the old fruiting wood at the time of the fall of the leaf, very little, if any, pruning will now be necessary. The leaves of the fig are large, and the branches should be arranged to allow plenty of room for the proper development of the foliage, without which good crops of choice fruit cannot be expected. A restricted root space is necessary for the fig, but when this has been fully taken possession of by the roots, an annual dressing of some reliable fruit manure should be applied to the surface of the border at this season, and well watered in. A good mulching of rotten manure may also be given with advantage at the time the fruits commence to swell up.

PLUMS AND CHERRIES.—The young foliage of these fruits is liable to be attacked by aphis, and as it is impossible to combat these pests by using an insecticide until after the fruit is set, much damage in the meantime is often done to the trees. This may in a great measure be prevented by spraying the trees just before the blossoms expand with some reliable insecticide, to destroy any aphis which may have escaped the usual winter spraying, and at this season may often be found at the base of the buds.

RASPBERRIES.—If the ends of the fruiting canes were not slightly shortened at the time of training, let the points be cut back to just above the supports. Autumn fruiting varieties should be cut down to within six inches of the ground, the fruit from these being produced during the autumn on the young canes of the same season's growth. Where fresh plantations have been made during the autumn, if the young canes were not shortened at the time of planting, this should be done now by cutting them down to within a few inches of the soil, the object being to encourage the growth of strong suckers which should produce fruit in the following season. If a dressing of manure in the alleys has not already been put on, let this be done forthwith, that the rain may carry the manurial properties into the soil for the benefit of the plants, while the strawy portion of the manure will become clean for walking on by the time of fruit gathering.

GRAFTING.—Head back all branches of trees on which it is intended to perform this operation a few inches above the position where the young scions are to be inserted, at the same time being careful not to damage the bark on the portion remaining, by tearing, and have everything in readiness to carry out this work as soon as the sap in the trees commence to rise freely.—George Woolgate, Rolleston Hall Gardens.

LABOUR-SAVING APPLIANCES.

It is rather curious that in private gardens there appears to be no great anxiety to take advantage of the different appliances there are in the market for saving labour. We are now approaching the time when onions, carrots, parsnips, and other seeds will be sown, but, for the most part, drills are drawn with the corner of the hoe, and the seed is put in by hand, just in the old sweet way. The market grower, by the way, is far more up to date in the matter of seed sowing than most private gardeners, for he uses a small seed drill, which does the work quicker and better than is possible by hand, and if the soil is in right condition there is no need to wait for a still day. It is all very well to be continually talking about the advantages of thin sowing, but it is not such an easy matter to sow small seeds thinly and quite evenly by hand, and the bending posture gets tiring if one has a lot of sowing to do. And yet these difficulties can be got over, and seeds be sown at a uniform depth, in much less time, by the use of a drill.

Later on there is surface hoeing to be done, and every gardener knows the advantage of keeping the top crust of soil in crumbling condition for the sake of conserving moisture and keeping down weeds. The orthodox tool for this operation is the Dutch hoe, but if one has got a lot of ground to get over, and not much time to spare, the thing to use is that simple, but ingenious little wheel hoe known as the Planet Junior. This implement is largely used in market gardens and fruit plantations, and for getting over the ground quickly it knocks the Dutch hoe quite in the shade, while it also does its work effectually. For damping purposes and syringing the hand syringe still holds a honoured place in private establishments, but in this work time and labour may be saved by the use of one of the small spray pump apparatuses that can be fixed to the side of a wooden pail. These implements not only do their work well, but can be used with much less discomfort to the operator than a hand syringe, particularly if this implement is not quite in first-class order. H

THE PERPETUAL FLOWERING CARNATION SOCIETY.

The GREAT SPRING SHOW of CARNATIONS will be held in the ROYAL HORTICULTURAL HALL, Vincent Square, Westminster, S.W., on WEDNESDAY, March 24th.

Admission from 1 p.m. to 6 p.m. 1s.

Schedules and particulars from the Honorary Secretary, Mr HAYWARD MATHIAS, "Lucerne," Stubbington, Fareham, Hants.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

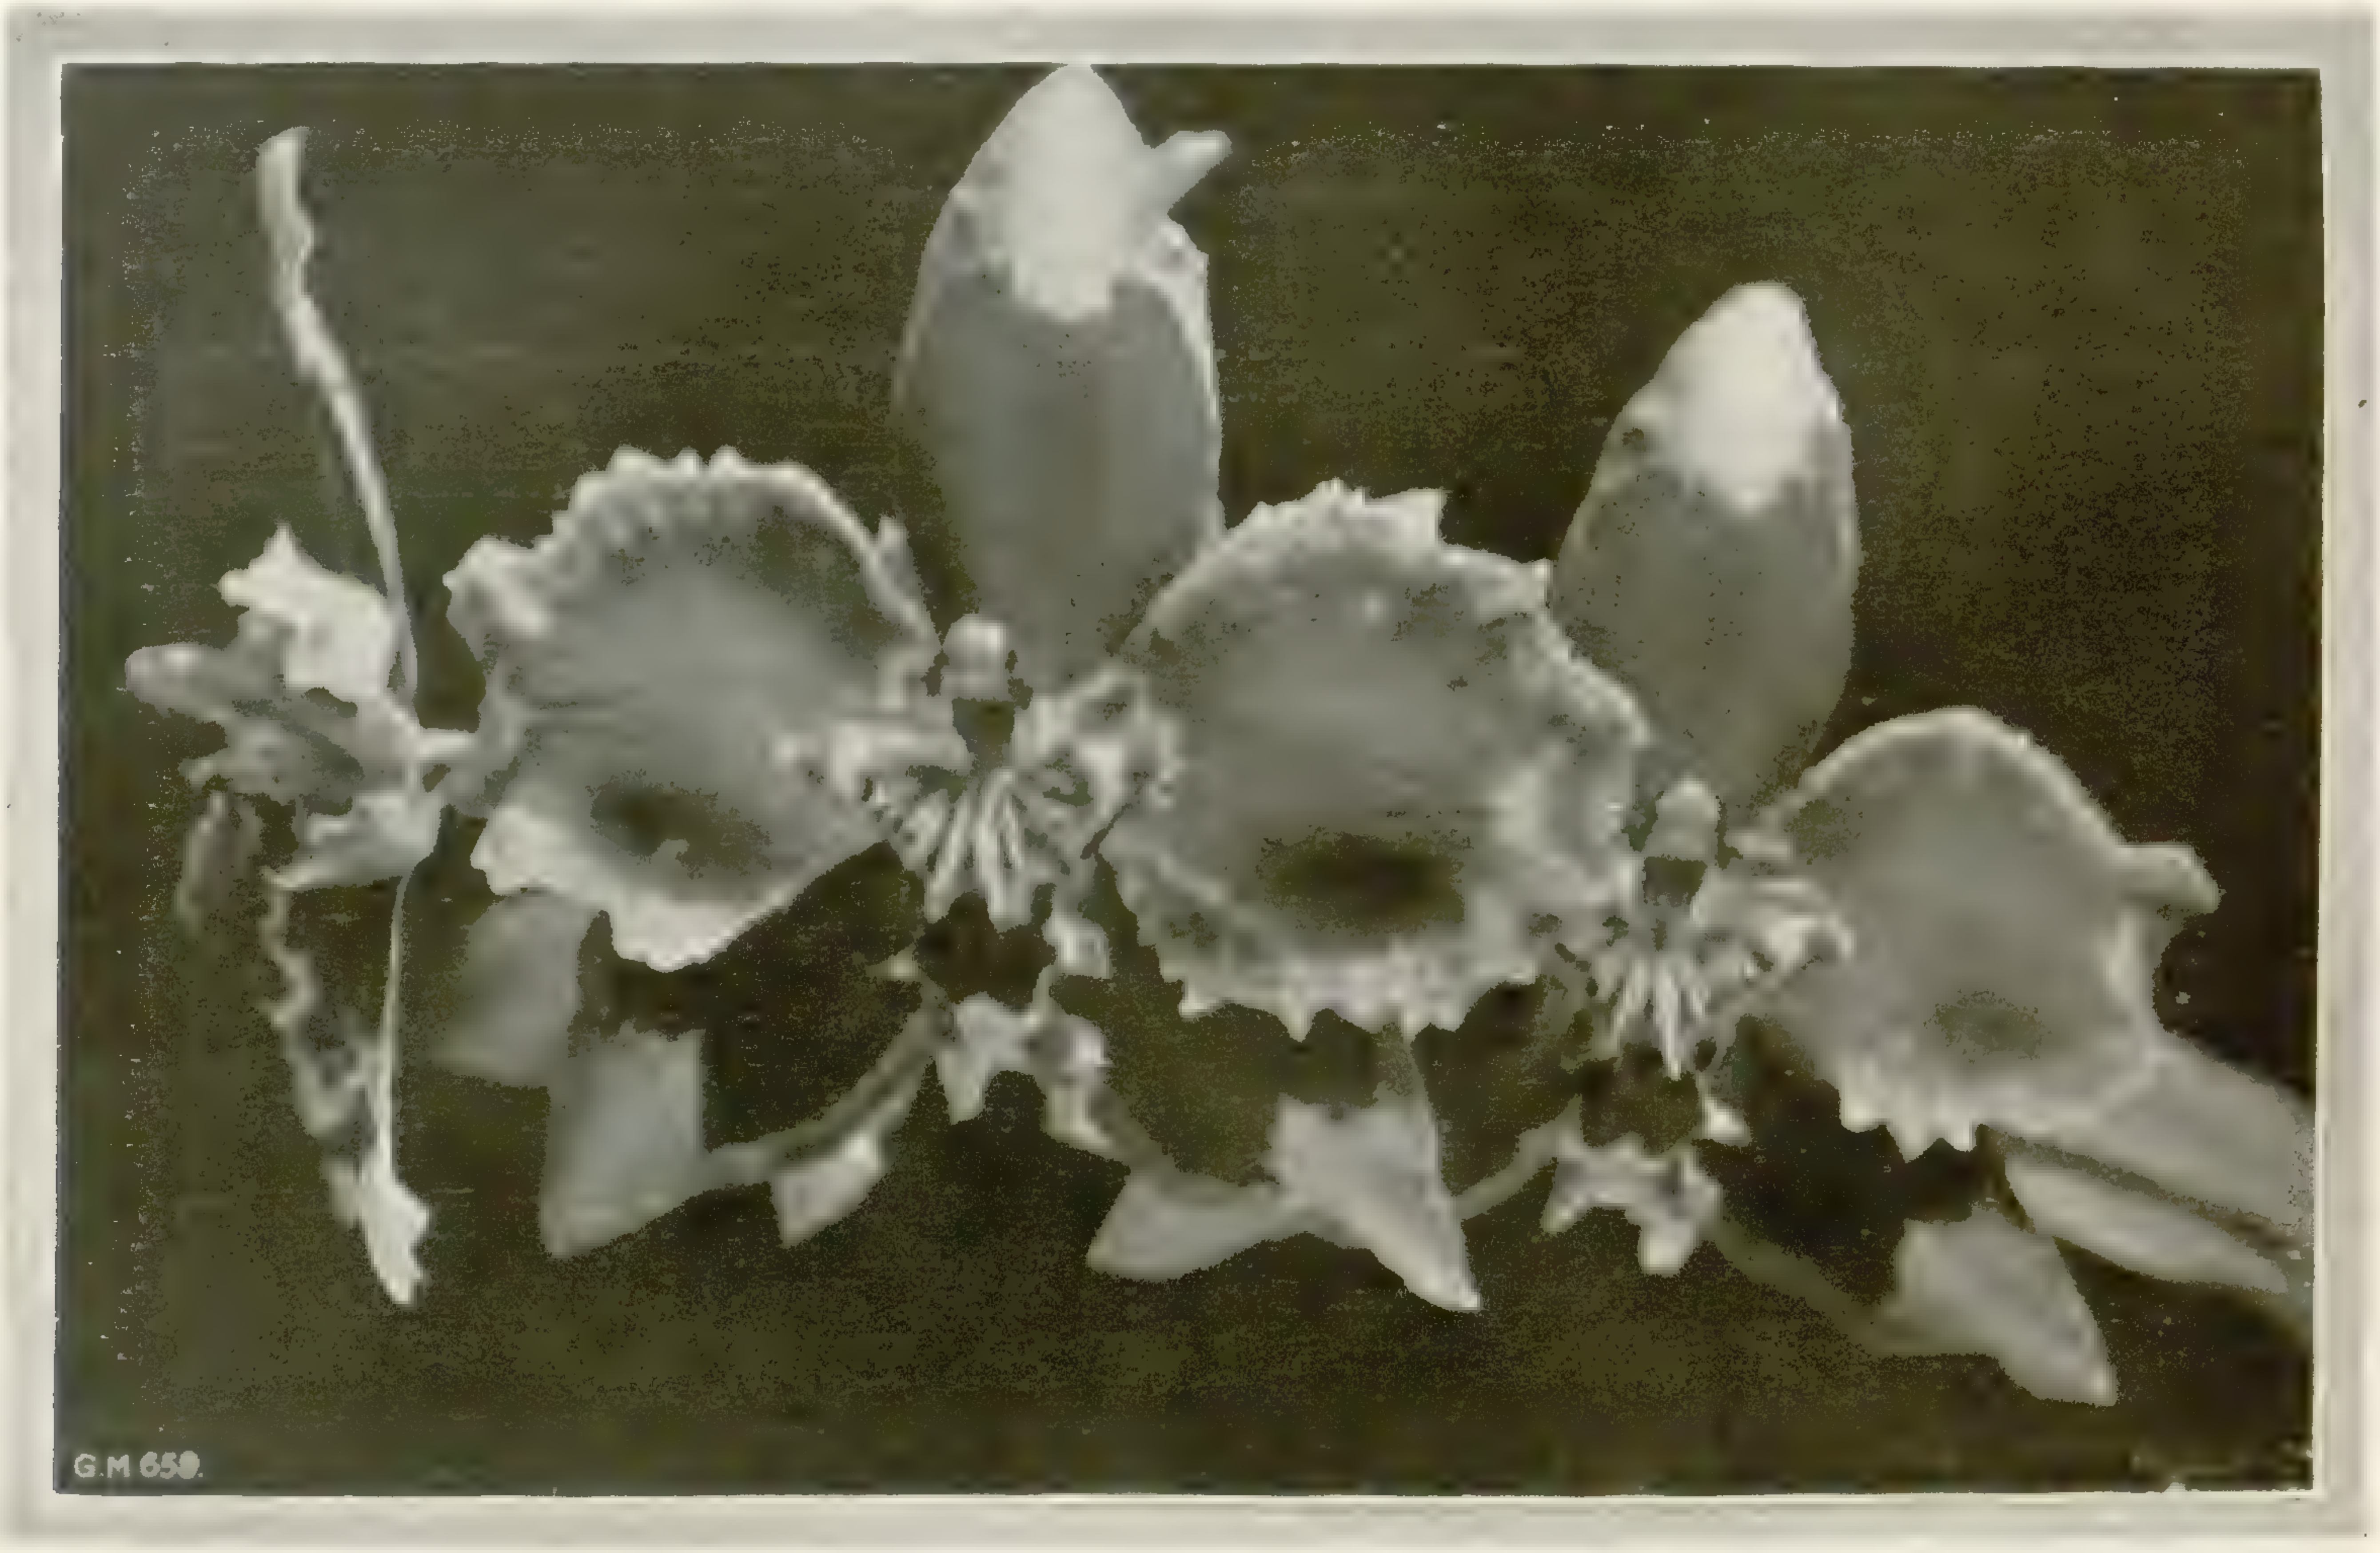
EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

MARCH 9.

The hall on this occasion was filled to its utmost capacity, both the annexes being utilised to make room for the exhibits, which in many instances had to be somewhat crowded for lack of space. The attendance, too, was much too large for the gangways allowed, and during the afternoon locomotion was difficult in the extreme, while reporting was almost out of the question for a time.



ODONTIODA BRADSHAWIÆ COOKSON'S VARIETY.

A magnificent bigeneric hybrid, of which the seed parent was a fine form of Odontoglossum crispum; the flowers are brilliant scarlet; the petals have a margin of rich mauve, and the sepals are tipped with the same colour. It was raised in the collection of Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne, and received a F.C.C. at R.H.S. meeting, on Tuesday, the 9th inst.

FLORAL COMMITTEE.

A fine display of hardy plants came from Sir Eric Hambro, K.C.V.O., Hayes, Kent (gardener, Mr. J. Grandfield), who had tastefully arranged a large quantity of spring-flowering plants. The groups of primulas were most attractive, and embraced P. cortusoides, P. floribunda, P. dentriculata, and P. Forbesi, all in full flower, while some fine examples of saxifragas formed an attractive front line. Such subjects as Kalmia glauca, Spiræa Thunbergi, Azalea rosæflora, muscari in variety, were all utilised in quantity, and produced a fine effect.

Messrs. W. Paul and Son, Waltham Cross, Herts, contributed one of their well-known collections of camellias, both in pots and in a cut state, also some really fine plants of double-flowering peaches; these included the double white, crimson, and carnation varieties, all being in the best possible condition. The camellias were particularly healthy, and the most striking varieties were Reine des Fleurs, Mrs. J. Buchanan, and the single reticulata. Cut flowers of camellias were also displayed in baskets.

Messrs. J. Cheal and Sons, Crawley, were represented by a collection of rock and alpine plants, tastefully arranged in tufa stone. The clumps of primroses in variety were particularly good, while Olearia stellata, with Azalea mollis were outstanding features. Suitable conifers were employed as a background. Messrs. Bees, Lim., Liverpool, sent a fine exhibit of Primula malacoides in good form. The plants were grown in five-inch pots chiefly, and clearly demonstrated the value of this form for decorative purposes.

Lachenalias were staged in quantity and in good style by the Marquis of Salisbury, Hatfield (gardener, Mr. Prime). The plants were equally at home in pots and baskets, the whole being nicely arranged with suitable foliage plants and green moss. Messrs. Paul and Son, Cheshunt, had a miscellaneous exhibit of Azalea mollis in vases, some good plants of Primula Kewensis, and Clematis montana rubens in full flower. Lachenalias were also well grown. The popular perpetual-flowering carnations were admirably staged by Mr. H. Burnett, Guernsey, the whole exhibit being noteworthy for the excellent colour of the flowers, while the arrangement of the vases with asparagus and smilax left little to be desired.

A collection of spring-flowering plants was staged by Mr. W. P. Horton, Cravenhurst, Seaford, which included hyacinths, Iris reticulata, anemones, and lily of the valley.

Messrs. Jas. Carter and Co., High Holborn, presented a miniature spring garden, with a lawn that made one's eyes sparkle and long for the month of May. The grass was simply perfect, while beds of tulips, hyacinths, and narcissi were arranged round the sides. Lilacs, prunus, and standard laurels helped to form an attractive background.

A good miniature rockwork from Messrs. R. Wallace and Co., Colchester, attracted much attention, for it was a fine effort in a small space. The irises were grouped in various positions and made pleasing contrasts. The sweet little Viola gracilis looked charming, while muscari in variety, cyclamen, and anemones all added colour to the scene. The conifers were sparingly used, but they were sufficient to harmonise with the rest of the exhibit.

Mr. G. Reuthe, Hardy Plant Nursery, Keston, made a bold display with hardy flowers, using some of the rarer rhododendrons for a background, while the irises in variety, and crocuses were most attractive. From Mr. W. H. Page, Tangley Nurseries, Hampton, came a very fine collection of narcissi and liliums grouped in tall pyramids with a foreground of carnations in all the popular varieties.

An interesting display of fibrous-rooted begonias was staged by Messrs. H. Cannell and Sons, Swanley, which demonstrated the value of this section for winter decorations. The old B. fuchsioides was in fine condition, as were also Vesuve, Paul Bruant, B. Haageana, and Saturne; needless to add, the whole of the plants were well-grown and tastefully staged.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, had a large exhibit of flowering plants. Azalea indica in variety formed the most prominent feature, while the small orange trees were wreathed with blossom. Some capital plants of Boronia megastigma were also noted, as were also good decorative plants of Crowea angustifolia.

Messrs. H. B. May and Sons, Upper Edmonton, arranged a table with a variety of subjects.

From Messrs. H. Low and Co., Bush Hill Park, came a well-grown collection of acacias, chiefly of a decorative size, with good plants of daphnes, ericas, palms, and foliage plants. The same firm also staged some capital carnations, in which the vases of Aristocrat, White Enchantress, and Britannia, were most conspicuous. Messrs. T. S. Ware, Lim., Feltham, also staged hardy flowers arranged on a natural rockery. The irises were quite a feature, while other suitable plants were saxifragas in variety, winter aconites, and Ficaria grandiflora.

Another collection of rock and alpine

plants were put up by Messrs. G. and A. Clark, Dover, who staged in their well-known style. The primroses were especially good, both in the colour and size of the flowers. Hardy ferns were also a feature here, while the hepaticas only required a burst of sunshine to produce fine masses of colour. Messrs. W. Cutbush and Son, Highgate, staged forced shrubs and hardy flowers.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. Sutton and Sons, Reading, staged a collection of lettuces and radishes, grown on the so-called French system, which were splendidly developed, in spite of the severe weather. The former were displayed in baskets, and included good clean samples of Sutton's Nonsuch, Early Paris, Commodore Nutt, and others. The radishes were excellent, especially Forcing Carmine, a most attractive variety, French Breakfast, and Red Market.

In Class 10, for apples, Mr. M. Nicholls, gardener to Sir M. E. Collett, Bart., Kemsing, Sevenoaks, was first with Hambling Seedling, Alfriston, Newton Wonder, and Bramley's Seedling. Mr. H. Markham, gardener to Viscount Enfield, Wrotham Park, Barnet, second, with good dishes of Chelmsford Wonder and Striped Beaufin. There were three exhibitors.

Class 11 was for one dish of cooking apples. Here Mr. J. Whittle, gardener to Colonel Borton, Cheveney, Kent, was first with a good example of Belle Dubois. Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was second with well-coloured examples of Bramley's Seedling; there were five exhibitors.

For a collection of apples Messrs. J. Veitch and Sons were the only exhibitors, winning with well-coloured examples of Wadhurst Pippin, Alfriston, Lord Derby, Lane's Prince Albert, Belle Pontoise, Bramley's Seedling, Newton Wonder, and Betty Geeson.

A nice collection of well-preserved apples came from Mr. G. B. Baskett, gardener to Mr. P. Nelke, Woodlee, Virginia Water, the best being Cox's Orange Pippin, well-coloured, King of Pippins, Wellington, and Ribston Pippin.

Mr. E. Beckett, gardener to the Hon. V. Gibbs, Aldenham House, Elstree, staged three baskets of Ailsa Craig onions, which were not only of the highest culture, but were also well preserved.

NARCISSI COMMITTEE.

Messrs. Barr and Sons, Covent Garden, were represented by a display of daffodils in good condition. The most striking varieties were Princess Ida, Princess Maud, Victoria, Admiral Togo, and Fairy Queen. They also presented a large display of crocuses with Iris tuberosa, Shortia galacifolia in good colour, and hepaticas in variety.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, occupied an entire table with hyacinths in pots. The spikes were well-developed, and the whole collection well arranged. A few of the most striking varieties were Lady Derby, Masterpiece, Fabiola, L'Innocence, Ivanhoe, Chas. Dickens, Moreno, Mina, King of Blues, Distinction, and La Victorie.

Messrs. M. Gleeson and Co., Watford, also contributed a large display of hyacinths in pots, which made a good display, though the large plunging pots did not improve them from a decorative point of view.

A tasteful group of narcissi was staged by the Rev. J. Jacob, Whitchurch, Salop. The flowers were arranged on a bright green felt, which proved most appropriate. The most conspicuous were N. Fairy, Sarah Bernhardt, Hoboken, and Mrs. Herbert, quite a number of the Tazetta type were staged, which included some new colours.

Messrs. R. H. Bath, Lim., Wisbech, made a really fine display of flowering bulbs, grown in pots and vases. The latter were very fine, especially the tulips and narcissi, while bowls of all shapes and sizes appeared to suit the bulbs equally well. The hyacinths also appeared very much at home.

An entire table was occupied with a collection of spring-flowering bulbs from Mr. W. Howe, gardener to Lady Tate, Streatham. The table was a mass of flowers. The narcissi arranged in blocks of each variety were most attractive, while a front was formed with miniature hyacinths relieved with lachenalias. Hippeastrums were also much in evidence, while the tulips were in fine condition.

Messrs. W. Cutbush and Son, Highgate, contributed a table of narcissi and hyacinths in large variety.

Mr. F. H. Chapman, Guldeford Lodge, Rye, staged a small exhibit of daffodils, which included Ben Johnson, Madame de Graaff, and Homer, also a few pots of irises, while Mr. R. Sydenham, Birmingham, had a nice exhibit of lily of the valley, hyacinths, narcissi, and tulips in bowls, with moss fibre.

Messrs. Cartwright and Goodwin, Kidderminster, arranged a fine exhibit of narcissi tastefully displayed with isolepis. A few of the most conspicuous were Grandee, Emperor, Empress, Circlet, Chaucer, Felicity, Blackwell, White Lady, and Autocrat.

BULB COMPETITION.

On this occasion liberal prizes were offered for hyacinths by the Royal Dutch Bulb Growers' Society at Haarlem; and Mr. Robert Sydenham offered prizes for bulbs grown in fibre without drainage.

In the amateur section for eighteen hyacinths, distinct, there were six competitors. The Hon. V. Gibbs (gardener, Mr. E. Beckett) was first with a fine collection, some of the best varieties were Lady Derby, L'Innocence, City of Haarlem, Rose Merveille, Captain Boyton, and King of Blues. The second prize was awarded Mr. L. Noblett (gardener, Mr. R. T. Bushell), Monkswell, Wavertree, Liverpool, with a nice even display. The Duke of Portland (gardener, Mr. J. Gibson) was third.

Class 7, for six single hyacinths, five entries. Here the Hon. Mrs. Guy Baring, 16, Cadogan Square, first, with medium spikes; Miss C. A. Michell, Oakfield, Cricklewood, second; and Mr. R. Holmes, Norwich, third.

For four pans containing ten bulbs, one variety, Mr. J. Gibson obtained premier honours with some splendid spikes. His varieties were La Grandesse, Moreno, King of the Blues, and City of Haarlem. Mr. E. Beckett was second with an even display, while Mr. J. Vert was third.

For six vases of tulips, the Hon. Mrs. G. Baring was placed first with nice pots of Keizer Kroon, Rose Gris de Lin, Pottebakker White, Van de Neer, and Vermilion Brilliant. Mr. W. Howe was second, and Mr. Hall, gardener to Mrs. Buxton, Cobham, third.

For six vases of narcissi Mr. W. Howe was a good first, with Emperor, Victoria, Madame de Graaff, and Sir Watkin in good form.

The gold medal of the Royal Dutch Bulb Growers' Society at Haarlem was awarded to Messrs. R. and G. Cuthbert, Southgate, who had a fine display of hyacinths, occupying the entire end of the hall. They were displayed in mounds of distinct varieties, in association with maidenhair ferns, each variety being represented by eight or ten good spikes. A few of the best were Queen of England, Rose Merveille, Lord Balfour, City of Haarlem, Simplicity, Lord Mayo, Charles Dickens, and Mina.

ORCHID COMMITTEE.

A glorious bank of orchids came from Mr. J. Collier, gardener to Sir J. Colman, Bart., Gatton Park. It was literally a feast of dendrobiums, and was much admired. Some of the most prominent forms were D. Cooksoni, D. Dormanianum, D. Wiganianum aureum, D. Cybele Gatton Park variety, D. nobilis, and D. n. alba; groups of epidendrums were lightly arranged at the back, while some choice odontoglossums, cattleyas, and other kinds helped to swell a magnificent exhibit.

From Mr. Chapman, gardener to Mr. N. Cookson, Wylam-on-Tyne, came a beautiful Odontioda Bradshawiæ Cookson's variety, a distinct break from the type. The petals are about three inches over, and the sepals proportionately broad; bright scarlet, the petals margined, and the sepals tipped with mauve.

From Messrs. James Veitch and Sons, Lim., Chelsea, came a small group of cypripediums, which included C. Harrio-Leeanum, and a variety of hybrids between C. villosum and C. Euryades, also some good forms of Odontoglossum crispum, O. triumphans, and Brasso-cattleya Thorntoni.

Messrs. Cypher, Cheltenham, made a nice display of dendrobiums, which included some good forms, also a few well-flowered plants of Sophronitis grandiflora, and a few nice cypripediums.

Mons. Maurice Mertens, Ghent, sent a small exhibit of odontoglossum hybrids, also some white cattleyas, and a fine form of miltonia, likewise some pretty cypripedium hybrids.

Mr. W. P. Horton, Cravenhurst, Seaford, staged a table of odontoglossums, cypripediums, and dendrobiums, which included a few nice pieces of D. Wardianum.

Messrs. Sander and Son, St. Albans, had a small, though choice collection of orchids, in which were noted some very fine cattleyas.

CERTIFICATES AND AWARDS.

First Class Certificate.—To Sophro-cattleya Thwaitesi, from R. G. Thwaites, Esq.; to Cattleya Trianæ Grand Monarch, from F. Menteith Ogilvie, Esq.; to Odontioda Bradshawiæ Cookson's var., from N. C. Cookson, Esq.; to Cattleya Cliftoni magnifica, from Messrs. Charlesworth and Co.; and to Cattleya Schroderæ Mrs. F. Sander, from Messrs. Sander and Sons.

Award of Merit.—To B.-l.-c. Cooksoni, from Messrs. Charlesworth and Co., and to Odontoglossum Myonianum, from J Gurney Fowler, Esq.

Botanical Certificate.—To Chytroglossa Marilloniæ, from Messrs. Sander and Sons.

Cultural Commendation. — To Cymbidium insigne, from Baron Schroder.

MEDALS.

Gold.—Sir E. Hambro, and Sir J. Colman, Bart.

Silver-gilt Flora.—Messrs. Charlesworth and Co., and Messrs. Cartwright and Goodwin.

Silver-gilt Banksian.—Lady Tate, Messrs. W. Cutbush and Son, and Messrs. J. Carter and Co.

Silver Flora.—Messrs. W. Paul and Sons, Mr. W. H. Page, Messrs. H. Cannell and Sons, Mr. L. Russell, Messrs. Sander, Messrs. H. Low and Co., and Messrs. R. H. Bath, Lim.

Silver Banksian.—Messrs. H. B. May and Sons, Messrs. T. S. Ware, Lim., Messrs. H. Low and Co., Messrs. J. Peed and Son, Mr. H. Burnett, Messrs. W. Cutbush and Son, Messrs. J. Veitch and Sons, Lim., Messrs. Bees, Lim., Marquis of Salisbury, Mons. M. Mertens, Messrs. Cypher, Mr. P. Nelke, Messrs. Sutton and Sons, and Hon. V. Gibbs.

Reading Rose Society.

The annual general meeting of subscribers was held at the secretary's offices, the Rev. F. Page Roberts presiding over a scanty attendance. The Secretary (Mr. C. J. [illegible]lett), submitted the report, in which reference was made to the record entries and general high quality of the exhibits in competition at the show held in the Abbey Ruins on July 1 last. Great regret was expressed at the meagre attendance of the public on the show day, notwithstanding the fact that ideal weather prevailed. The donors of the challenge bowl and cups were heartily thanked, and an appeal made for further cups. The statement of accounts showed that the expenses had exceeded the receipts by £37 17s. 3d. In reviewing the position, the committee considered it would be advisable to change the locale of the show. Mrs. Rufus Isaacs was elected president for the year; and, in consideration of the circumstances, gave permission for the next show to be held in the grounds of Fox Hill on June 30.

Reading Gardeners' Association.

An extremely interesting scientific lecture was given by Professor Keeble, of the University College, Reading, at the fortnightly meeting of this society, in the Abbey Hall, the subject being "Applied Mendelism." The president (Mr. Alderman F. B. Parfitt) occupied the chair, and among the large audience were the vice-president and Mr. M. H. F. Sutton.

Professor Keeble opened his remarks by stating that at present Mendelism was in its infancy, and comparatively little was yet known regarding the abstruse laws governing heredity, which had puzzled scientists for many ages. He also pointed out that in almost all cases of great discoveries years elapsed before mankind awoke to their real value, and Mendelism was no exception to this rule. The fact that like produces like was correct only in a degree, for in the course of experiment under Mendelian laws, it was frequently found that the hybridisation of two flowers would result in blooms of quite a different shade and character to either flower—e.g., two white sweet peas crossed produced a purple; this was due to latent characters which could only manifest themselves when in conjunction with other complementary characters which came together as a result of hybridisation.

Hybrids always embodied the colour, habit, and constitution of both parents, though one only might be evident, but the influence of the recessive qualities came out in the second generation. Thus, if tall peas were crossed with dwarf peas, the result would be tall peas only, but the second generation produced by self-fertilising these hybrid plants would give 25 per cent. dwarf, and 75 per cent. tall, proving that the characters of the dwarf parent had been carried through a generation without visibly showing. At the close of his lecture, Professor Keeble answered fully the many questions put to him. The meeting terminated with a hearty vote of thinks to the lecturer, proposed by the vice-president and seconded by Mr. A. F. Bailey.

Mr. F. Townsend, head gardener to the vice-president, exhibited a beautiful group of primulas, for which he was awarded a certificate; and Mr. W. Barnes, head gardener to A. F. Walter, Esq., Bearwood, staged (not for certificate) some splendidly-grown seakale. Several new members were elected.

United Horticultural Provident and Benefit Society.

The annual general meeting of this society was held on Monday, 8th ult., at the Royal Horticultural Hall, Mr. Thomas Winter, in the unavoidable absence of Mr. C. H. Curtis, in the chair. The Chairman dealt with the most prominent points in the report which had previously been read by the secretary, and moved its adoption, and that it be printed and circulated. Mr. A. J. Brown, of Chertsey, supported the motion, which was carried unanimously. Mr. J. J. Frogbrook moved a vote of thanks to the trustees for the admirable manner in which they had discharged their duties during the past year. Similar votes were proposed, and carried, to the treasurer and auditors, who, under the constantly-increasing work of the society, were required to give more and more attention to its interests.

Mr. Brown proposed "The Committee and Officers," and, in the course of his remarks, stated that every member was gratified with the result of the past year's working. The annual dinner had been a great success, and the general management of the society left little to be desired. He hoped the society would still continue to prosper, and offered to assist in providing music for the next annual dinner. The retiring members of committee were Messrs. Hawes, Frogbrook, Winter, and Hill, and these gentlemen were re-elected, as also were the treasurer and auditors. Mr. C. H. Curtis was re-elected chairman of committee, and Mr. S. Winter vice-chairman.

Birmingham Gardeners' Association.

"The Rotation of Vegetable Crops" was the important and interesting subject dealt with by Mr. A. Jeffs, gardener to Alderman E. Ansell, Esq., Moor Hall, Sutton Coldfield, in the presence of a fair assemblage of the members. Mr. T. Humphreys presided. Mr. Jeffs, who was a member of the Sutton Coldfield Gardeners' Branch of the Birmingham parent society until it was abrogated some years since, adverted to the great benefit he had derived in his young days from the lectures, discussions, library of the association, etc., and strongly recommended the young gardeners to avail themselves of such invaluable means of improvement.

Mr. Jeffs, who is a most successful exhibitor of vegetables in the Sutton Coldfield district, was enabled to afford considerable information obtained from his own experience. He advocated, as one of the best, cheapest, and most economical manurial composts, notably for potatoes, plenty of burnt garden refuse, in preference to converting it into an otherwise decayed state, and thus also effecting the destruction of the larvæ of insects and fungi. In the matter of garden soil that had been subjected to heavy and continuous cropping, or containing an excess of humus, and, consequently, deteriorating produce, he had found that one of the most effective correctives was to allow the ground to "rest," or lay fallow for a year or two untouched, and not to trouble about weeds, except to prevent their seeding, the result being, after duly digging or forking it over, a thorough renovation of the soil and excellent crops of vegetables without additional manure for at least the first season or so. Mr. Jeffs' remarks gave rise to a useful discussion, and he was heartily thanked at the close.

British Gardeners' Association.

LONDON BRANCH.

On Saturday evening, March 6, the first social evening, in the form of a smoking concert, was held at Carr's, Strand, in aid of the branch funds. Mr. E. F. Hawes presided, and was supported by Mr. R. J. Frogbrook (vice-chair), Mr. T. Winter (treasurer), and many other leading members of the association. Notwithstanding the inclement weather, over seventy members and friends assembled to hear the excellent musical programme provided for the occasion. After the interval, the Chairman, in a brief speech, set forth the objects and work of the association, and invited any gardeners who were present as visitors to join at once, and bring along a friend next time. At the close of the evening a most hearty vote of thanks was accorded the artistes. A similar vote, with musical honours, was given the chairman, and then a brief announcement made by Mr. A. J. Hartless, the hon. secretary, brought a most enjoyable evening to a close.

Croydon Gardeners' Society.

The recent fortnightly meeting of this society was devoted to a paper by Mr. W. Rowson, of the Falkland Park Gardens, on manures. In tne course of his paper Mr. Rowson gave much useful information on the maintenance of the soil in a fertile state, and on the various natural and artificial manures suitable for use in the garden.

There was a good discussion at the close of the paper, and a vote of thanks was accorded Mr. Rowson. Among the contributions to the meeting were three fine dishes of pears from Mr. W. Pauley, well-developed forced rhubarb from Mr. Oxtoby, and excellent Jerusalem artichokes from Mr. Mills.

DESTRUCTION OF VERMIN.—Most gardens are pestered with Rats and Mice. Every effort should be made at this time of the year to exterminate them before seeds are sown. Danysz Virus is first rate stuff for killing these vermin. Single tube, 2s.; three tubes, 5s. Post free from DANYSZ VIRUS, LTD., 52. Leadenhall Street, Garden Dept., London, E.C.—[Advt.]

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

WARLEY YELLOW PRIMROSE.—F. E. A. B., Ballymascanlan: Exactly how much Warley Yellow differs from other yellow varieties of the primrose we are not in a position to say, simply because one needs to have a collection of varieties to enable proper comparisons to be made. We have not seen Warley Yellow catalogued, but we have seen it growing, and regard it as a very beautiful spring flower. Probably at a somewhat later date we may be able to make comparisons. You have an excellent collection, and it might be possible to effect by exchange what would not be possible otherwise.

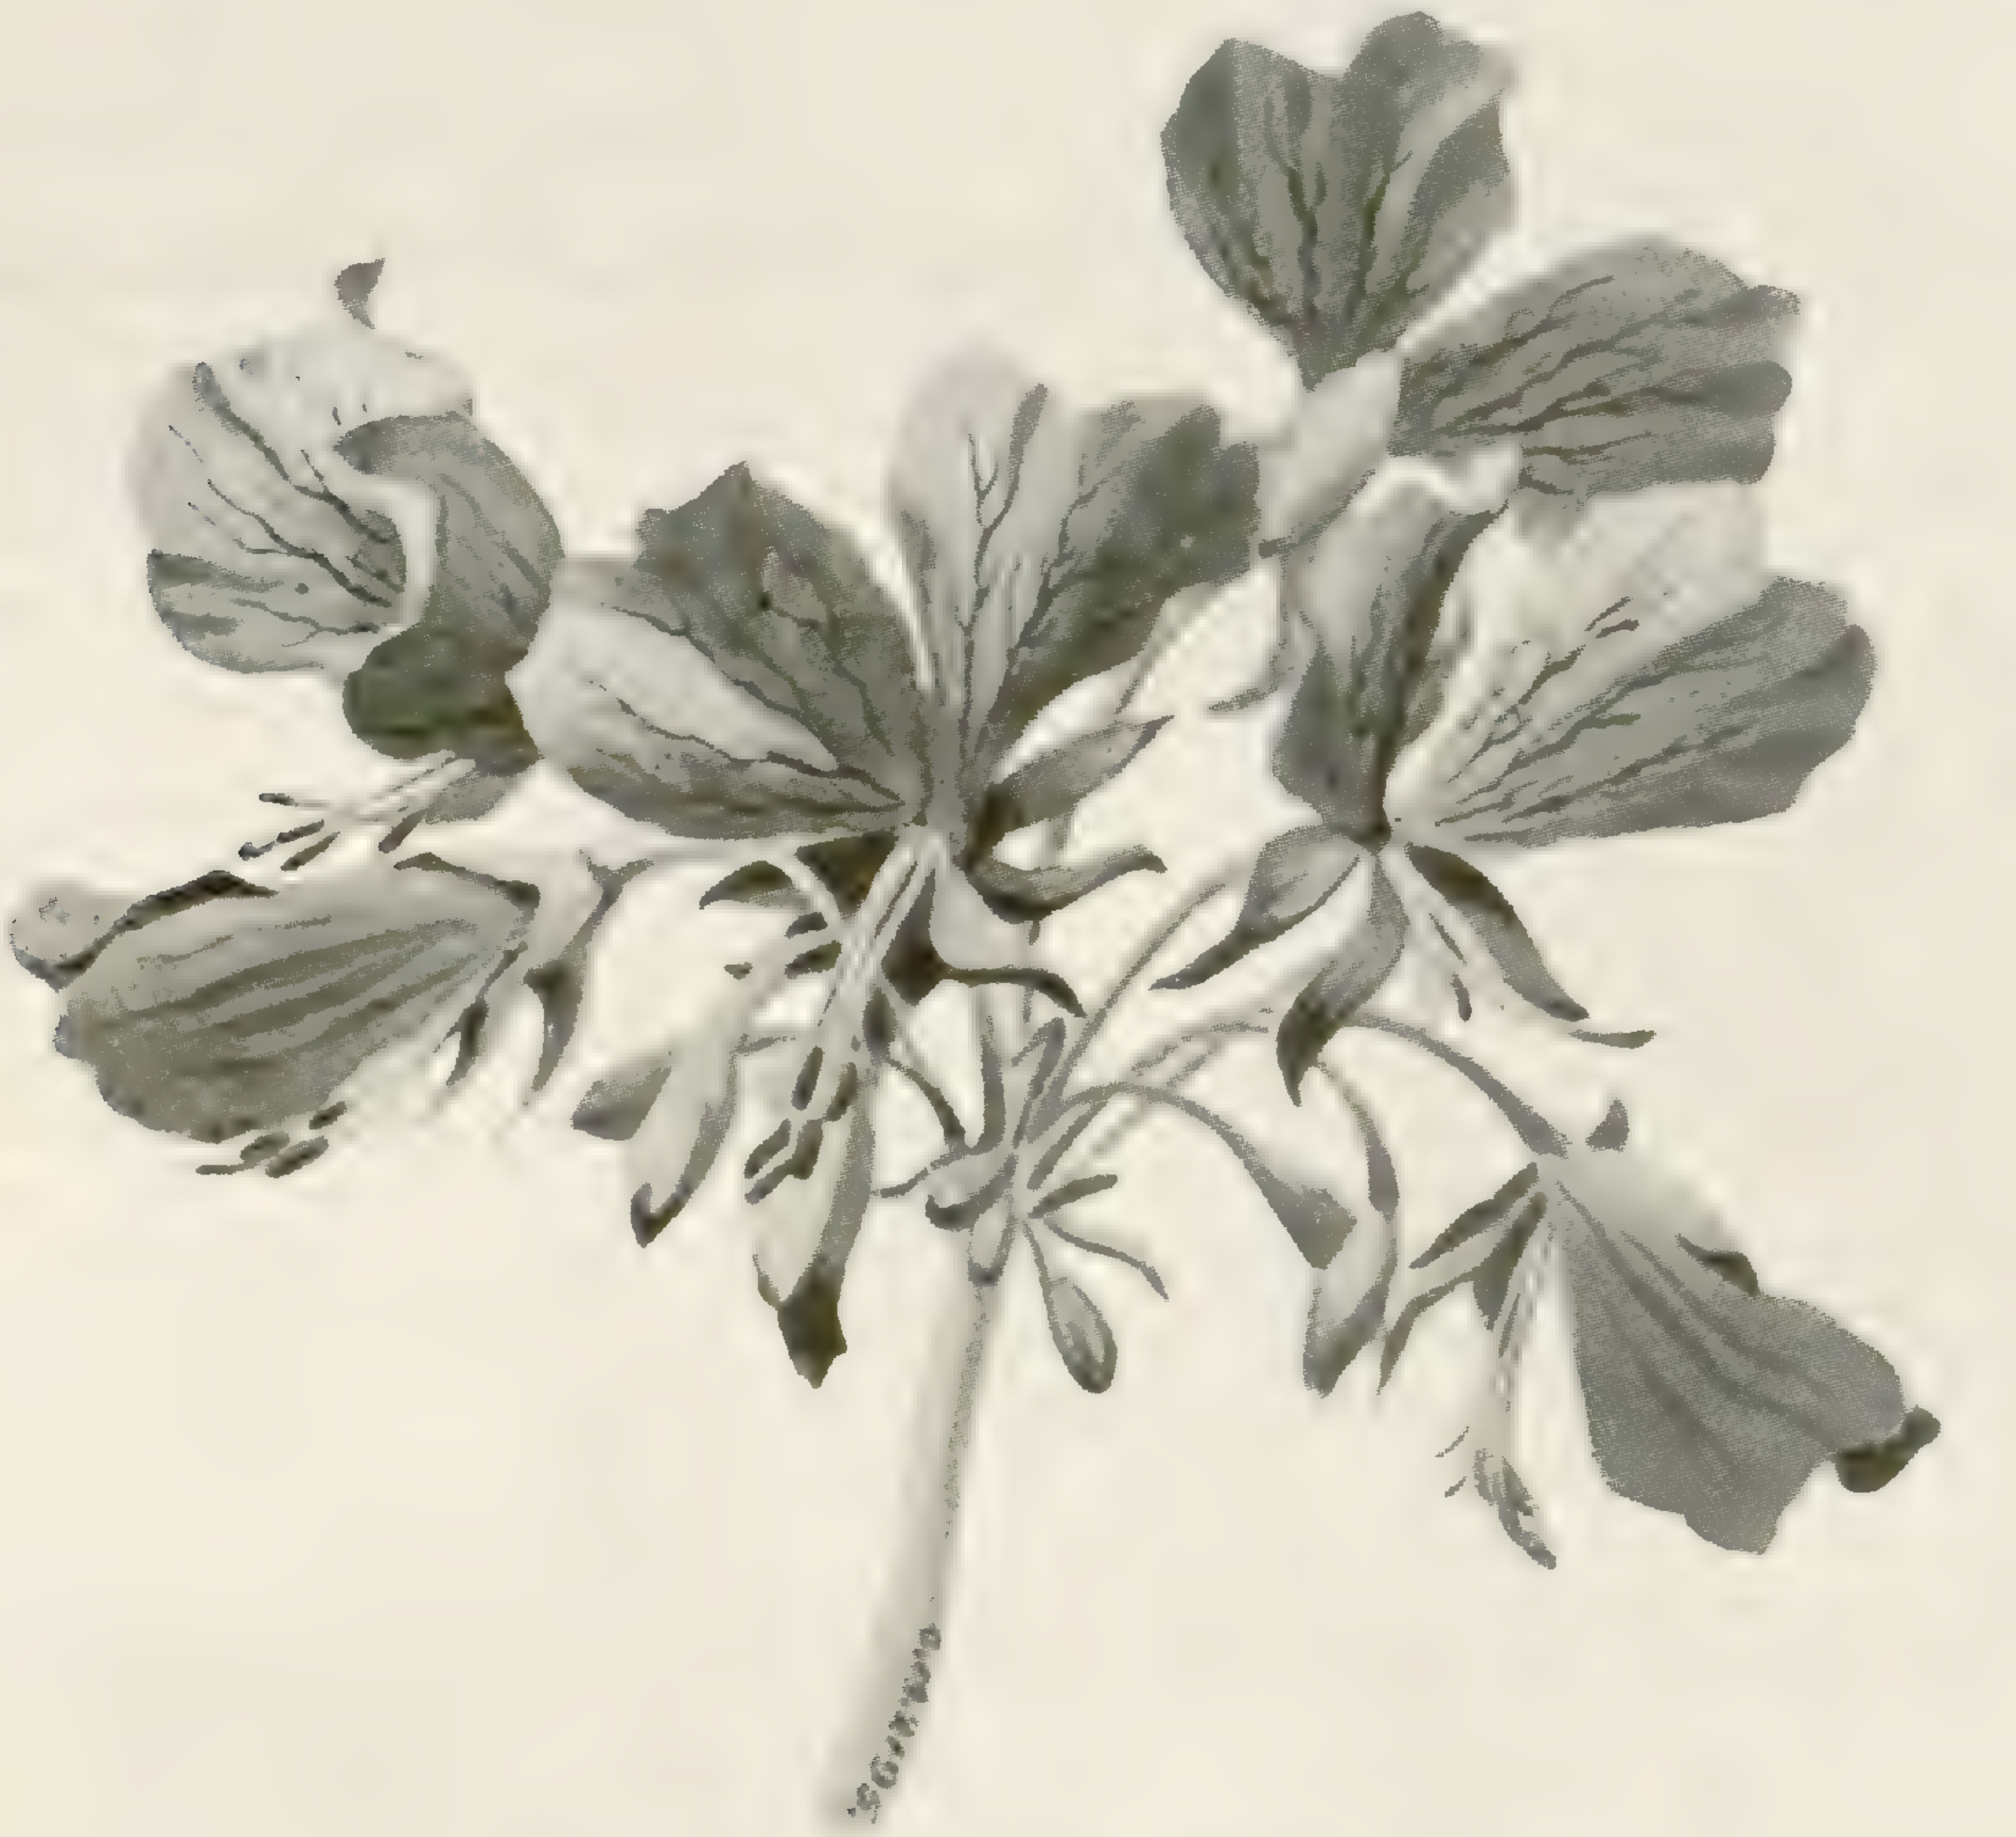
FAULTY HEATING.—F. F. J., Harwich: It is possible that there is a fall in the pipes somewhere; therefore examine the pipes and see that there is a gentle rise from the boiler to the extreme end of the heating apparatus. Open all the air taps and fill the feed tank. If no water passes through the air taps, and the feed tank remains full, then there is a stoppage somewhere, probably in the feed pipe. A piece of stout wire or a thin cane forced down the pipe may remove the obstruction; if the latter is moved the water in the tank will pass quickly into the boiler and from thence to the pipes, finding outlet at the air taps, which may then be closed, with the knowledge that the apparatus is filled with water. The feed box should be higher than the highest air tap or air tube. We prefer the latter to air taps in most cases, as there is then always a clear passage for air. The air tube or pipe may usually be carried sufficiently high to prevent loss of water. Air taps are very often forgotten, and the water in the pipes becomes air-locked and the heating faulty.

AMATEUR GARDENERS.—G. D. R., St. Neots: The following rule, taken from the constitution of the National Amateur Gardeners' Association, will, we think, meet your case: "No person shall be eligible to become a member of the Association who disposes of plants, flowers, seeds, or trades in garden produce for profit (except in the case of new seedlings and sports), or is in the employ of a nurseryman or gardener, or is employed as a gardener. Gentlemen who engage professional aid shall be entitled to become members, but shall not be privileged to compete at the exhibitions held by the Association, except in such classes as may be specially set apart for them. Occasional help from a labourer in wheeling, digging, and similar rough work, is, however, allowed to all members.

CAULIFLOWERS.—C. J. B., Limerick: Make a sowing of an early-maturing variety at once, in brisk heat, and as soon as the seeds have germinated place the pan or box near the glass in a cooler, but still warm, place, such as a pit, so that the seedlings do not become drawn. As soon as they can be conveniently handled prick out the seedlings in rich soil in a sheltered frame or pit, and when they are strong enough and the weather permits plant them out carefully, with a trowel, in rich land and an open position. Make a sowing out of doors at the end of this month or early in April.

OVERHANGING ELM TREE.—J. J., Stoke: Write to your neighbour, pointing out the inconvenience you suffer from the overhanging branches of his elm tree, and request that he remove them. The letter should be as pleasant a one as possible, and it should contain no threats or discourteous language. If your neighbour declines to remove the branches, then you can give him notice that after the lapse of a few days—say, a week—you will have them removed, and at the end of the time you may cut back the branches level with your boundary; but you must not cut them back beyond this, nor may you keep the branches without his permission, but must throw them over into his garden.

PELARGONIUM ENDLICHERIANUM.—F. E. G., Brighton: Almost hardy, this native of the Taurus was introduced in 1855, but it has not become a popular plant. It is a very interesting species, and has handsome, rather large, deep rose-coloured flowers, on erect herbaceous stems. P. Endlicherianum has a large root-stock, and its cordate leaves are obscurely five-lobed. The species flowers in summer, and bears its blooms in terminal loose umbels. It may be grown in an ordinary greenhouse all the year round, or it may be placed out of doors in a sunny position during summer. The accompanying illustration will serve to show the kind of flowers and inflorescence borne by this rather rare species.



PELARGONIUM ENDLICHERIANUM.

CHOICE HERBACEOUS PLANTS.—S. C. G., Wrexham: We take it that you refer to choice hardy flowers for beds and borders, and, if that is so, we can recommend for your purpose the selections and cultural notes given in the "Gardening Year Book for 1909" (post free, 1s. 2d., from the Gardeners' Magazine Office, 148, 149, Aldersgate Street, E.C.). The suitability of certain kinds for certain positions and purposes is discussed, and methods of propagation are stated. The great advantage of such an account as the one indicated is that you will not be confused with an almost endless list of names, or be left in a hopeless position as regards the selection of the best kinds and varieties to make a start with. You could not wish for a better guide on the selection and culture of hardy border flowers, or on the selection and culture of the various classes of tender plants, fruits, and vegetables.

FUCHSIAS FROM SEED.—H. H. P., Torquay: If you sow the seeds at once you should obtain plants that will flower in August. Use well-drained pots or pans, and make the soil firm; sow the seeds about an inch apart, and place in a warm house or pit to germinate. Prick off the seedlings early, and keep them growing freely, but as they advance in size do not over-pot them. The growing points may be pinched out about twice to induce a bushier growth, but this is not an essential matter if the purpose is to test the quality of the flowers. Narrow, pointed-leaved seedlings never give fine flowers—at least, the flowers are not fine in the estimation of the florists; consequently such seedlings may be thrown away to save time and space.

SWEET PEAS.—P. W. H., Birmingham: It is probable that the seeds have not been able to burst their hard coating. Find them, and then just cut a nick through the tough skin, along the back, and not along the scar-like surface where the seed was formerly in contact with the pod. You will find these and other particulars explained most clearly, as well as cultural directions, in "Sweet Peas and their Cultivation," by C. H. Curtis, 1s. 2d. or 1s. 8d., post free, from the "Gardeners' Magazine Office, 148 and 149, Aldersgate Street, E.C.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

J. L., Andover.—1, Garrya elliptica.

F. F., Rugby.—Odontoglossum Adrianæ.

N. W., Saltaire.—1, Cyperus alternifolius; 2, Cissus discolor; 3, Dendrobium nobile, a very ordinary form.

M. S. P., Warwick.—1, Dendrobium heterocarpum; 2, Dracæna Godseffiana; 3, Pteris tremula; 4, Acalypha Macafeeana.

E. H. B., Weston-super-Mare.—1, Tillandsia Lindeni; 2, Pelargonium denticulatum; 3, not recognised, send when in flower.

NEW BOOKS.

HANDBOOK ON PRUNING ROSES.

(Edward Mawley, V.M.H., Hon. Secretary, National Rose Society, Berkhamsted.) Price, 2s. 6d.

The new and revised edition of the "Handbook on Pruning Roses," recently issued to its members by the National Rose Society, is a very considerable improvement upon the first issue of the publication, and fully justifies the large amount of time that has been devoted to its preparation. The instructions have been revised throughout, and, where necessary, extended. The alphabetical list of roses at the end of the book has been made more complete by the inclusion of upwards of 100 varieties, mostly newer introductions. As the result of this augmentation of the list the rosarian who refers to the work will be able to find full directions for the pruning of 1,100 varieties.

CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE.

By D. B. Crane. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.). Price, 2s. 6d.

It was a happy idea on the part of Mr. Crane to write a book on the cultivation of chrysanthemums for beautifying the flower garden and the greenhouse during the autumn months, when their bright colours are especially acceptable. The idea was happy, inasmuch as no book of its kind had been previously published, previous authors of books on chrysanthemums having confined their attention to the exhibition side of these flowers. That a book dealing with the decorative varieties was wanted, and that Mr. D. B. Crane has provided exactly the work of which cultivators were in need, has been proved to demonstration by the rapidity with which the first edition was exhausted. We are not surprised that the book should have received a warm welcome from those who fully appreciate the varied charms of the varieties especially adapted to garden culture and to decorative purposes under glass and in the house, for Mr. Crane has a graceful style, and he writes with a full knowledge of the relative merits of varieties, and their cultural requirements. In the preparation of the second edition the full lists of varieties have been revised, new illustrations added, and other improvements made. The book is so comprehensive in its scope, and so admirable in treatment that we can strongly recommend it to the notice of our readers.

THE WATKINS' MANUAL.

By Alfred Watkins. (The Watkins' Meter Company, Hereford.)

Books on photography are so numerous and varied in treatment and merit that it is not easy for those who for the first time turn their attention to this fascinating art to select the instruction exactly adapted to his needs. Some are simple enough, and useful, but they do not go far enough to afford the assistance required by the beginner. Others do not give the help necessary in the preliminary stages to enable those who wish to depend upon them for guidance to make sufficient progress to take full advantage of the more advanced instruction. The book before us is free from either of the defects mentioned, and is so simple in the statement of details, and so thoroughly scientific in its treatment that the photographer will require no other guide until he has become so proficient that he is justified in specialising according to the trend of his taste. We can speak with the knowledge that comes from experience upon this point. We have had the second edition constantly in use for several years past, and have found it of so much service that we almost formulated the opinion that no more useful book could well be desired. But the fourth edition, now before us, is a considerable improvement upon all previous editions, and quite indispensable to those who have not mastered the art.

TWERTON HILL NURSERY, BATH.

ROSES AND ROSE GROWING.

By Rose G. Kingsley. (Whittaker and Co., 2, White Hart Street, Paternoster Square, E.C.) Price, 6s.

The books on roses, of which so large a number have been published during the past few years, might, with a very few exceptions, be divided into two classes. In the first we have books that are severely practical, and so technical as to provide but little reading that can be described as entertaining: and in the second, books that are brightly written, but more or less weak in the information they contain relating to the practical details of rose culture. Miss Kingsley's book belongs to the second of the two classes, and it in some respects more satisfactory than several books on roses that have preceded it, is disappointing, and especially coming so soon after her admirable book entitled "Eversley Gardens," which was reviewed in these pages a few months since.

CLAY'S SUCCESSFUL GARDENING.

(Clay and Son, Stratford, E., and Simpkin, Marshall, Hamilton, Kent, and Co., London, E.C.). Price, 9d.

Even in these days of cheap literature this work comes as a veritable surprise, for while low in price, there is no evidence of cheapness, as that term is understood in relation to publications of various kinds. Published at the small sum stated above, the book contains 275 pages, numerous illustrations, and is printed on excellent paper, and is strong and elegantly bound in green cloth. The get-up is indeed all that could well be desired, but, important as are elegant binding, excellent paper, and clear type, it is of still greater importance that the contents should be sufficiently diversified to embrace the whole of the work of the garden, and have been written by those who are well known as authorities on the various subjects,and in whom the reader can place implicit confidence. In the preparation of the book Messrs. Clay and Son have obtained the cooperation of twenty-five or twenty-six of the leading cultivators and writers, and gardening under glass, flower gardening, fruit growing, vegetable culture, suburban gardens and rockeries, the exhibition of garden produce, the culture of bulbs, and other matters that require the attention of those engaged in garden management are fully dealt with from the practical standpoint, and with sufficient lightness to render the task of studying the several subjects a pleasant one. The book is equally adapted to the requirements of the amateur and practical gardener, and were it published at three or four times the price we should not less strongly advise them to at once add it to their collection, and delve freely into the mine of information it contains.

THIRTY-NINE ARTICLES ON GARDENING.

By Emmeline Crocker, F.L.S. (Dulau and Co., 37, Soho Square.)

A series of thirty-nine interesting essays on gardening subjects. The essays are brightly written, and contain much useful information relating to plant life and its treatment in the garden. The book contains seven coloured plates, with which we are not much impressed, and an excellent index.

Prudential Assurance Company, Lim. — The directors of this flourishing company state, in their annual report for the year ending December 31, 1908, that the number of policies issued in the ordinary branch during the year was 80,379, assuring the sum of £7,614,898, and producing a new annual premium income of £440,376. The premiums received during the year were £4,616,337, being an increase of £135,960 over the year 1907. The claims of the year amounted to £2,812,962. The number of deaths was 8,389, and 15,322 endowment assurances matured. The number of policies in force at the end of the year was 866,797. In the industrial branch the premiums received during the year were £6,925,755, being an increase of £264,124. The claims of the year amounted to £2,670,345, including £72,696, the proportion of bonus paid since the date of the last annual meeting. The number of claims and surrenders, including 4,355 endowment assurances matured, was 310,722. The number of free policies granted during the year to those policyholders of five years' standing and upwards who desired to discontinue their payments, was 145,261, the number in force being 1,395,929. The number of free policies which became claims during the year was 40,094. The total number of policies in force at the end of the year was 17,963,127; their average duration exceeds eleven and a quarter years. The assets of the company, in both branches, as shown in the balance-sheet, are £71,958,859, being an increase of £3,952,575 over those of 1907.

CATALOGUES RECEIVED.

JOHN FORBES, HAWICK, N.B.—Mr. Forbes' plant catalogue is a remarkably full, useful, and interesting descriptive list of hardy and tender florists' flowers, and of hardy perennials. Over four thousand species and varieties are enumerated and described, and as these comprise the best in their several classes, the catalogue has strong claims as a work of reference.

THOMAS S. WARE, LIM., FELTHAM, MIDDLESEX.—This catalogue of herbaceous, alpine, and water plants, roses, etc., is comprehensive and admirably prepared, and contains all the best of the hardy plants for the herbaceous border, the rockery, and the water garden. The catalogue also contains full lists of roses, dahlias, carnations, and several other important classes of plants.

CLARENCE ELLIOTT, SIX HILLS NURSERY, STEVENAGE, HERTS.—An excellent catalogue of alpine and herbaceous plants, containing [illegible] of the many species and varieties in cultivation, [illegible] of much value to the cultivator for the [illegible] amount of information given in the notes [illegible]panying the names of the plants enumerated.

R. H. BATH, LIM., WISBECH.—This nicely got up catalogue should prove of great interest to those who are fond of florists' flowers, as it contains very complete lists of carnations, dahlias, pansies, violas, begonias, phloxes, etc., etc.

H. J. JONES' NURSERIES, LIM., RYECROFT, LEWISHAM.—The new plant and seed catalogue from the Ryecroft Nurseries is a substantial little work of 140 pages, brimful of interest, and especiall notable for its lists of new chrysanthemums, Michaelmas daisies, zonal pelargoniums, carnations, dahlias, phloxes, and sweet peas.

GEE AND SONS, BIGGLESWADE.—This seed catalogue will appeal to many because it is so handy for the pocket. It is small, but good.

BLACKMORE AND LANGDON, TWERTON H[illegible] NURSERY, BATH.—The greater part of this c[illegible]logue is occupied by descriptions of fine t[illegible]gonias suitable for various purposes, and c[illegible] notes. Carnations and violets are also listed.

CHAS. TURNER, SLOUGH.—A useful list of seed potatoes, flower and vegetable seeds, tools and sundries.

HUGH LOW AND CO., BUSH HILL PARK, ENFIELD.—Malmaison and perpetual carnations are fully described in the new catalogue; the new varieties are of special interest.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrips, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Temperature.

The question of temperature is a very important one with regard to plant life, since it has not only formed one of the main factors in the evolution of that variety of form which constitutes the basis of our enjoyment as flower lovers, but success or failure still depends largely upon it under cultural conditions. As a rule, the rate of growth is determined by the amount of warmth afforded either naturally by the sun or artificially by the stove, and, under wild conditions, as we know, the ebb and flood of vegetative activity coincides with the decline or increase of the solar heat, according to the season. When alternations of sunshine and cloud, warm sunshine and genial showers, give place to bitter winds, and snow and hail on wintry blizzard lines, which the sun's rays appear incapable of modifying, we see at once how the vigorous growth of a week or two may be severely checked, and brought to a practical standstill. The bursting and unfolding buds of tree and shrub make no progress at all, and it is only when we examine the alpine tribe of plants, such as the primulas, saxifrages, and their kin, that we note continued well doing, due to the fact that as natives of mountain heights and a cool environment generally, they are really more in their element than under normal spring conditions. They have been evolved to make the most of the time when winter has done its worst, and the snow-clad heights begin to throw off their dazzling mantle of white to permit these highland flowers to see the light again, and, thus endowed with special vigour, their offspring and representatives in the lowlands feel the less the temporary incursion of the winter conditions we may be experiencing. One of the greatest puzzles in this particular connection is the great diversity of temperature which is experienced at like periods of the year. Small fluctuations we naturally expect at this season; there is always a struggle going on, as it were, with the retreating forces of King Winter and the advancing ones of King Sol, but why the latter should sometimes apparently beat a precipitate retreat for a week or two, and leave the field in the foe's possession so thoroughly, is an enigma which even our most expert meteorologists, we fancy, can throw no light upon whatever. What determines the steady and persistent flow of biting wind from the north-east for so long? We ask in vain, we may be told of barometrical depressions here, and risings yonder, but these are only indications of facts, and not reasons for their existence, and we are as wise, or rather as ignorant, as ever. One thing, however, we may learn from the example of the alpine plants alluded to, and that is that coddling and protection from chill are not always conducive to vigorous growth, however much growth depends in general way on warmth. There are plants and plants. Some, like alpines, are the children of the bleak hillsides, others have been evolved under warm valley or glen conditions, and it may be even tropical ones. Such conditions are usually essential to existence, and must be imitated, as far as possible, when, as in these days of facile transport, plants are transferred from one part of the world to another, and consequently it may be to very different climates from their native ones. It, however, by no means follows that a plant from under the Equator is necessarily a stove plant. Temperature depends not only on latitude or longitude, but also on elevation, the snow line exists in the tropics as well as in cooler regions, it is simply at a higher elevation, and on the flanks of tropical mountains we consequently find all grades of vegetation, suited at their feet for stove culture, higher up for the temperate house, and higher still they are absolutely as hardy as the Arctic flora itself, and inevitably perish if treated as stove plants, because of their tropical origin, a point well worthy of being borne in mind. This season the temperature has been so uniformly low that fruit trees and ornamental plants have as yet escaped the injurious effects that usually result from the alternation of periods of heat and cold.

MR. WILLIAM HOWE.

Mr. William Howe has so long occupied a prominent position as an active worker in the cause of charity, and for the advancement of horticulture, and as a successful exhibitor, that he is one of the best-known and most highly respected gardeners within the Metropolitan area. In presenting our readers with Mr. Howe's portrait it is of interest to recall the fact that he spent much of his early life in the great gardening establishments north of London. When a lad, fifteen years of age, Mr. Howe commenced his career in the gardens of Aldenham House, then occupied by Mrs. Michael Bass. Thence he went to Hillfield House, Aldenham, and he left there to enter the gardens of Warren House, Stanmore, where, as in the two other gardens he remained about two years. Leaving Warren House Mr. Howe obtained a position in the gardens of Bentley Priory, then the property of Sir John Kelk, where he had the advantage of being under two of the foremost gardeners of their day. Seeking knowledge further afield, Mr. Howe went to Osteley Park, Ellesmere, as foreman. and after a stay of two years he came back to London to occupy a similar position in the gardens of Park Hill, Streatham, then the property of William Leaf, Esq., and under the charge of Mr. T. Page, a successful exhibitor of hard-wooded plants and pineapples. When, on the death of Mrs. Leaf, in 1874, Mr. Page retired, Mr. Howe was appointed his successor, and this position he has occupied with singular success until the present time. The estate was purchased about 28 years ago by the late Sir Henry Tate, who will long live in the memory of art-loving people by his munificent gift to the nation of the collection of pictures in the Tate Gallery. Encouraged by appreciative employers, Mr. Howe has, during this long period, fully maintained the high reputation of the Park Hill gardens, notwithstanding the increased difficulties consequent on the enormous extension of buildings on all sides. Mr. Howe, although he does not make special provisions for exhibiting, has achieved much success at competitive gatherings with fruits, flowers, and plants. He has at Park Hill a remarkable Alicante vine which, during the past 28 years has borne from 85 to 100 bunches annually of the average weight of 3lb., some bunches reaching 7lb. Mr. Howe is a member of the Royal Horticultural Society's Floral Committee; the National Chrysanthemum Society's Executive and Floral Committees, and the Royal Gardeners' Orphan Fund Committee.

Kew Gardens.—Although the season is a very backward one, and in many of the flower beds the daffodils have scarcely pierced the soil, there is very much to interest a visitor to Kew.—The greenhouse is particularly bright with hyacinths, daffodils, amaryllis, carnations, forced shrubs, Coleus thyrsoideus, primulas, acacias, wallflowers, etc., etc. The crocuses under the big Turkey oak commenced to open during the genial sunshine of Tuesday last, and under the lilacs in the great bed near the Sun Temple the Winter aconites were quite gay. On the Cumberland Mound, snowdrops, hellebores, and crocuses, are attractive, and in various parts of the gardens the earliest shrubs are putting forth their flower buds. The new formal water garden, near the old museum, is finished; there is water in most of the seven pools, and the groundwork all round is now being completed.

Severe Frost at The Hendre.—Mr. T. Coomber writes from The Hendre Gardens, Monmouth: We registered 25 degrees of frost on the morning of March 4, and 32 degrees on the morning of March 5, and the ground on these dates was covered with about six inches of snow. On March 6 we registered 0.55 inches of rain—really melted snow and sleet.

The Extemporised Lawn that was formed by Messrs. James Carter and Co., of High Holborn, on the occasion of the exhibition held by the Royal Horticultural Society on the 9th inst., was so interesting and attractive as to merit more prominent mention than it was possible to give in our report of that gathering. This lawn was of special interest for the advance it evinced in the presentation of horticultural products to public notice, and also for the evidence it afforded of the possibilities in forming grass lawns from seeds when, as in this case, the several kinds most suitable for the purpose are selected and used in the proper proportions, and the seeds are of the highest quality. Not only did the firm lay down within the precincts of the great hall a lawn that at once attracted attention by reason of the uniformity of growth and the rich green of the grass, but they tastefully embellished it with flowers and other accessories, and thus provided a valuable object lesson in the art of exhibiting. One side and two of the ends had a charming fringe of flowers, consisting chiefly of hyacinths, narcissi, and tulips, and the flowers had for a background a belt of shrubs, chiefly evergreens. At either end was a stone vase filled with shrubs, and in the centre was an elegant sun-dial. The grey colouring of these admirably harmonised with the rich tone of the grass, and the bright hues of the flowers, and appreciably contributed to the general effect. This lawn may well be regarded as a veritable triumph, and worthy of taking a high place among the achievements of the firm.

Orchid Hybrids.—Mr. H. J. Chapman, gardener to N. C. Cookson, Esq., Wylam-on-Tyne, placed before the R.H.S. Scientific Committee Odontioda Bradshawiæ, Oakwood var., raised by crossing Odontoglossum crispum var. Graireanum (white) with Cochlioda Noetzliana. The flowers showed no trace of blotching, but were almost of one shade of colour throughout. Another form, Odontioda Bradshawiæ, Cookson's var. (see p. 211), raised from Odontoglossum crispum x Cochlioda Noetzliana, had a deep mauve margin to the bright red segments, and showed distinctly the deeper coloured blotches upon the lighter ground colour. The difference in colour and markings in these two varieties forms an interesting problem in heredity.

Flower Imports were in February last above the average, the value having been £32,971, as compared with £30,541 and £25,541 in the corresponding month of 1908 and 1907. The value for the first two months of the year was £62,635. In the same period of 1908 and 1907 the value was £59,721 and £44,086.

Stephanotis Fruiting. — Miss Frances Brenan, The Cottage, Ballymascanlan, Louth, Ireland, writes that a stephanotis in her garden flowered profusely all last season, and is now carrying one large fruit, about as large as a medium-sized pear. The plant is in a ten-inch pot, and is usually potted every third year. It grows freely, flowers profusely, and keeps clean and healthy. As Miss Brenan remarks, it is not often the stephanotis fruits, and it is remarkable that only one flower out of many left to wither, should have formed a seed pod.

The Perpetual Flowering Carnation Society holds its sixth exhibition in the Royal Horticultural Hall on Wednesday, March 24, and its annual dinner will be held on the evening of that day at the Hotel Windsor, Victoria Street, Westminster. An excellent schedule is provided for the March show, and both amateurs, gardeners, and traders are encouraged to compete.

Erlangea tomentosa.—There is now flowering in the greenhouse at the Royal Gardens, Kew, a very interesting plant that promises to be a very useful one for conservatory and greenhouse decoration during the late winter months. It is a composite, hailing from the higher land of British Central Africa, and needs pretty much the same treatment as a eupatorium, or say Coleus thyrsoideus. The flowers are borne very like those of a eupatorium, and the florets in the little heads of bloom are all fairly well developed, but there are no distinct ray florets, as in so many composites. These little heads are freely borne in clusters several inches across, and they are of light blue colour that fades to lilac with age. The stems and the backs of the leaves are downy, and the plants are 2ft. to 2½ft. high.

Rock Gardens.—At the general meeting of the Royal Horticultural Society on Tuesday next, March 23, Mr. R. Lloyd Praeger will give a lecture on "Rock Gardens: Natural and Artificial." The chair will, as usual, be taken at 3 p.m.

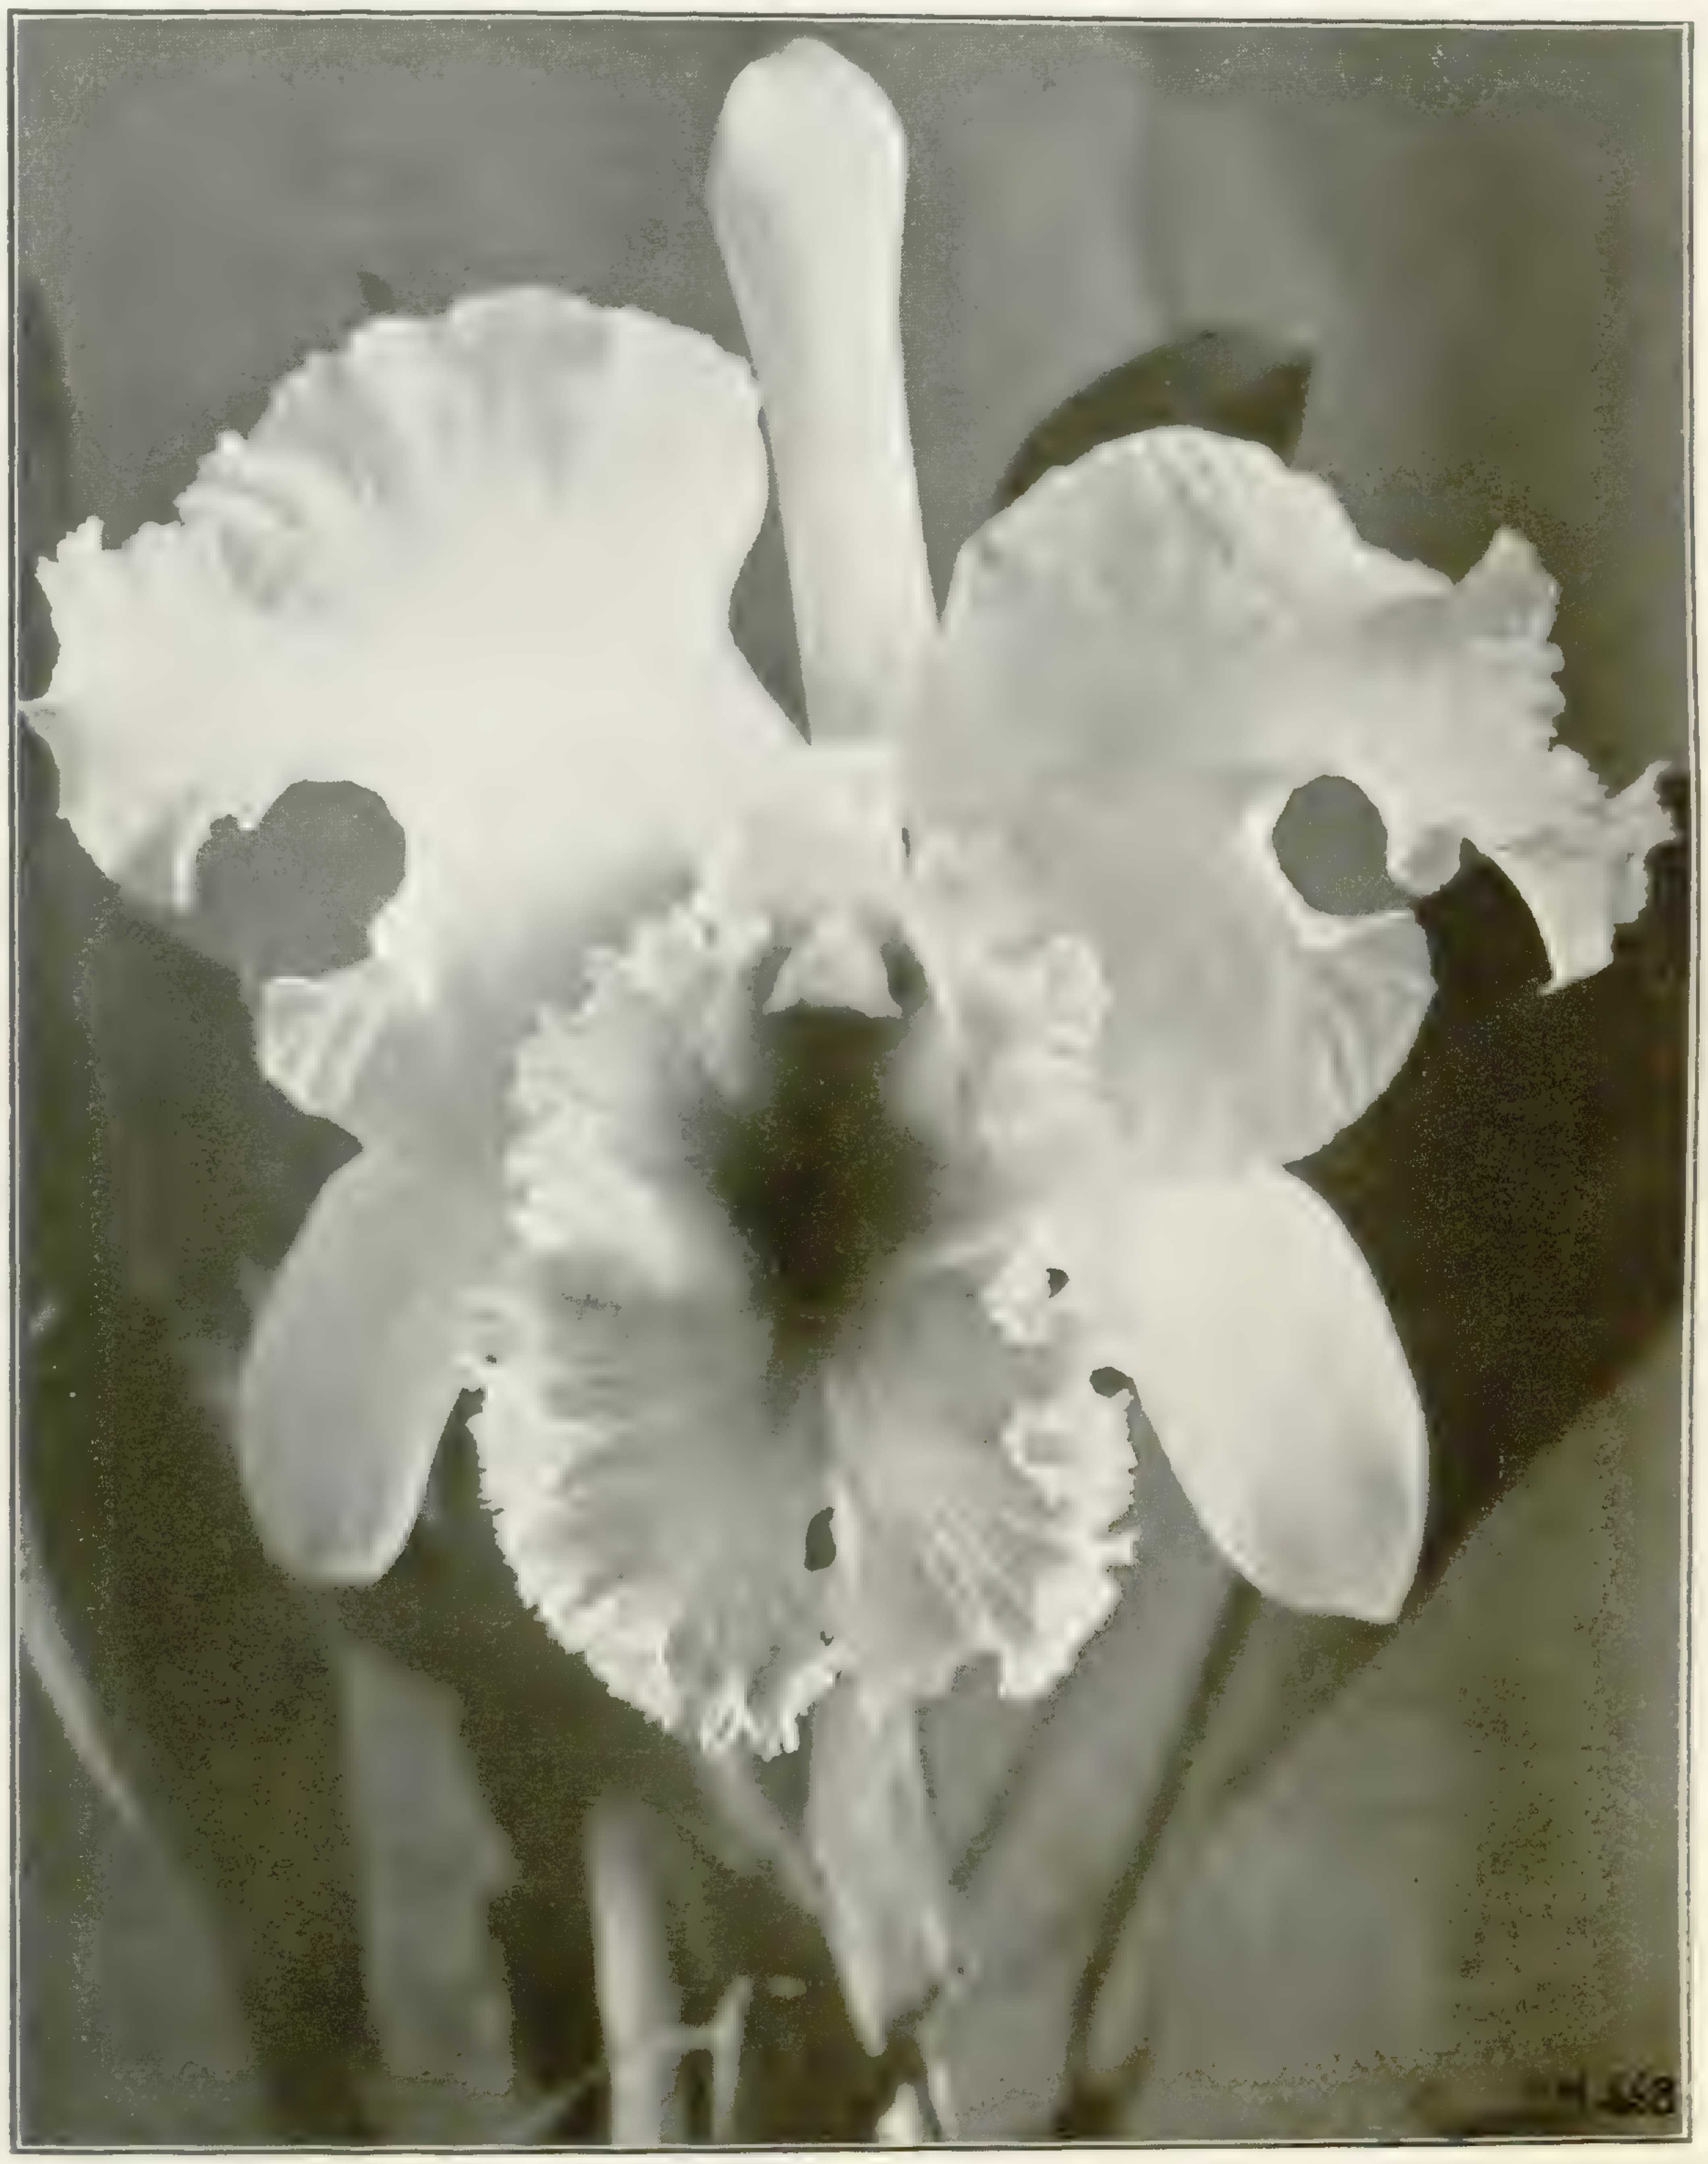
Mealy Bug.—The term "Mealy Bug," according to the "Journal" of the Board of Agriculture, is applied to two members of the family Coccidæ, viz., Dactylobius citri and D. longispinus (formerly known as Coccus adonidum). These insects are harmful, not only on vines but on other greenhouse plants. The best treatment for destroying these pests consists in fumigation with hydrocyanic acid gas. According to Newstead (Monograph of the British Coccidæ, Vol. II.), D. citri breeds rapidly in summer, and although the males are not found in winter, all stages of the female occur. This species secretes honey, and this is taken as a food by ants. Where the insect is abundant the honey collects on the leaves of the infested plants, and acts as a germinating medium for fungus spores. D. citri has been recorded at Kew in the open, "on ivy-clad hothouse walls." D. longispinus resembles the former species in its mode of life. It is a greenhouse species in temperate climates, but an open-air species in tropical and sub-tropical countries.

Tree Lopping in Burnham Beeches.—A correspondent of the "Times" has adversely criticised what is being done by the City authorities in pruning certain of the old beeches, and some of the luxuriant hollies. In a reply thereto Mr. M. C. Duchesne writes: "These old pollard beech trees, after having been lopped regularly for centuries—accounting for their present picturesque appearance—have been allowed to develop branches, in many cases, for upwards of 150 years. The dimensions of the limb mentioned by "Rusticus" gives a good idea of the size some of these have attained. The pollard trunks are, in nearly all cases, mere shells, only a few inches in thickness, and the weight of the large limbs which the trunk supports has frequently been responsible for the loss of the tree. In spite of extensive wiring of the branches, unsightly props, and other steps taken to prevent this loss, this can be seen in every part of the Beeches—seven fine trees were lost last summer alone. This danger grows more serious every year, as the tops get heavier and the pollard trunks decay further. There are other reasons that make it important that the tops should be lightened. One of these is too scientific and lengthy to go into here; but the death of the finest tree, known as the 'Queen Beech,' and two other fine pollards by the Plain, was due to this cause. . . . A third reason for cutting back some of the largest limbs is to encourage fresh growths of branches below, and if this is deferred much longer there is the risk of losing the vitality of the dormant buds. The question of public safety must also be considered, and there have been what can only be described as miraculous escapes from death from falling limbs.

The Daylight Saving Bill, which, we are told, has been introduced with a view "to promote the earlier use of daylight in certain months yearly," has been read a second time in the House of Commons, and referred to a Select Committee. Its history in this year is therefore the same as that of last Session, and it is difficult to imagine that it will proceed far beyond the committee-room. It is proposed by the Bill that from two o'clock in the morning, Greenwich mean time in Great Britain, and Dublin mean time in the case of Ireland, of the third Sunday in April in each year, until two o'clock in the morning of the third Sunday in September, the local time shall be one hour in advance of the Greenwich and Dublin mean time respectively. During the other half of the year the time will remain as now. It was urged by the supporters of the Bill that it would be an enormous advantage to those engaged in agriculture, gardening, and the various trades to have the clock put on an hour during the period embraced by April and September, the speakers being evidently oblivious of the fact that a very considerable proportion of the workers have to travel considerable distances to reach their employment and consequently to rise early.

Royal Agricultural Society.—At the monthly meeting of the council of this society Mr. Adeane, in presenting the report of the Finance Committee, said that the total income for the year was £8,442, giving a credit balance of £563. The society's capital at the end of 1907 stood at £29,267. The total capital at the present time was £43,592. The reserve fund at the end of 1907 stood at £22,000; it was now £37,700. This was the largest invested fund the society had ever possessed. The Finance Committee estimated that from subscriptions of governors and members they would this year receive £7,480, and that the total receipts would be £8,780. The contribution to the show account of £2,500 would make a total estimated expenditure for the year of £8,326, giving an estimated balance of receipts over expenditure amounting to £454. They were getting through their period of stringency, and on the part of some there was a desire for expansion. He only hoped they would not go in for expansion too quickly, and that their memories would not be too short, because it was only five years ago that the society assembled together to consider whether their financial position would permit of the "Royal" show being held in the ensuing year. They ought to secure the society against ever being placed in such a position again.

Revision of the French Tariffs.—At the last meeting of the Commission Administrative de l'Union Commerciale des Horticulteurs et Marchands Grainiers de France, presided over by Mons. A. Truffaut, it was decided, after due consideration of the propositions contained in the report of the Commission on the Revision of Tariffs to be submitted to the French Parliament, to protest against any new duties or increase of duties on the importation of plants, flowers, fruits, and vegetables. Although the additional duties proposed are not very high, the Union Commerciale, according to the vote recorded on the subject at the last general meeting, is of opinion that French horticulture is sufficiently protected. The adoption of new or increased taxes which have been asked for by a small group of interested persons might, it is feared, induce other countries to create new taxes or increase existing ones, which would sensibly affect the exportation of French products, such as flowers, fruits, and palms from Southern, and plants and trees from Western parts of France; as well as of primeurs or early vegetables and fruits from the Paris district, the whole of which forms the most important part of French horticulture. It was decided that another deputation should wait upon the president of the Commission, and also that Mons. Deloncle, M.P. for the Department of Seine, and Mons. Arago, M.P. for the Alpes Maritimes, should be asked to use their influence, and to oppose all new taxes, and any increase of existing taxes when the discussion of the Bill takes place in the French Parliament. French horticulturists of all descriptions wish it to be known that they are opposed to new or increased duties being put upon gardening goods, as they are convinced that nurserymen of both countries must benefit by every facility being given for a free entry of such goods from other countries into their own.



BRASSO-CATTLEYA CLIFTONI MAGNIFICA.

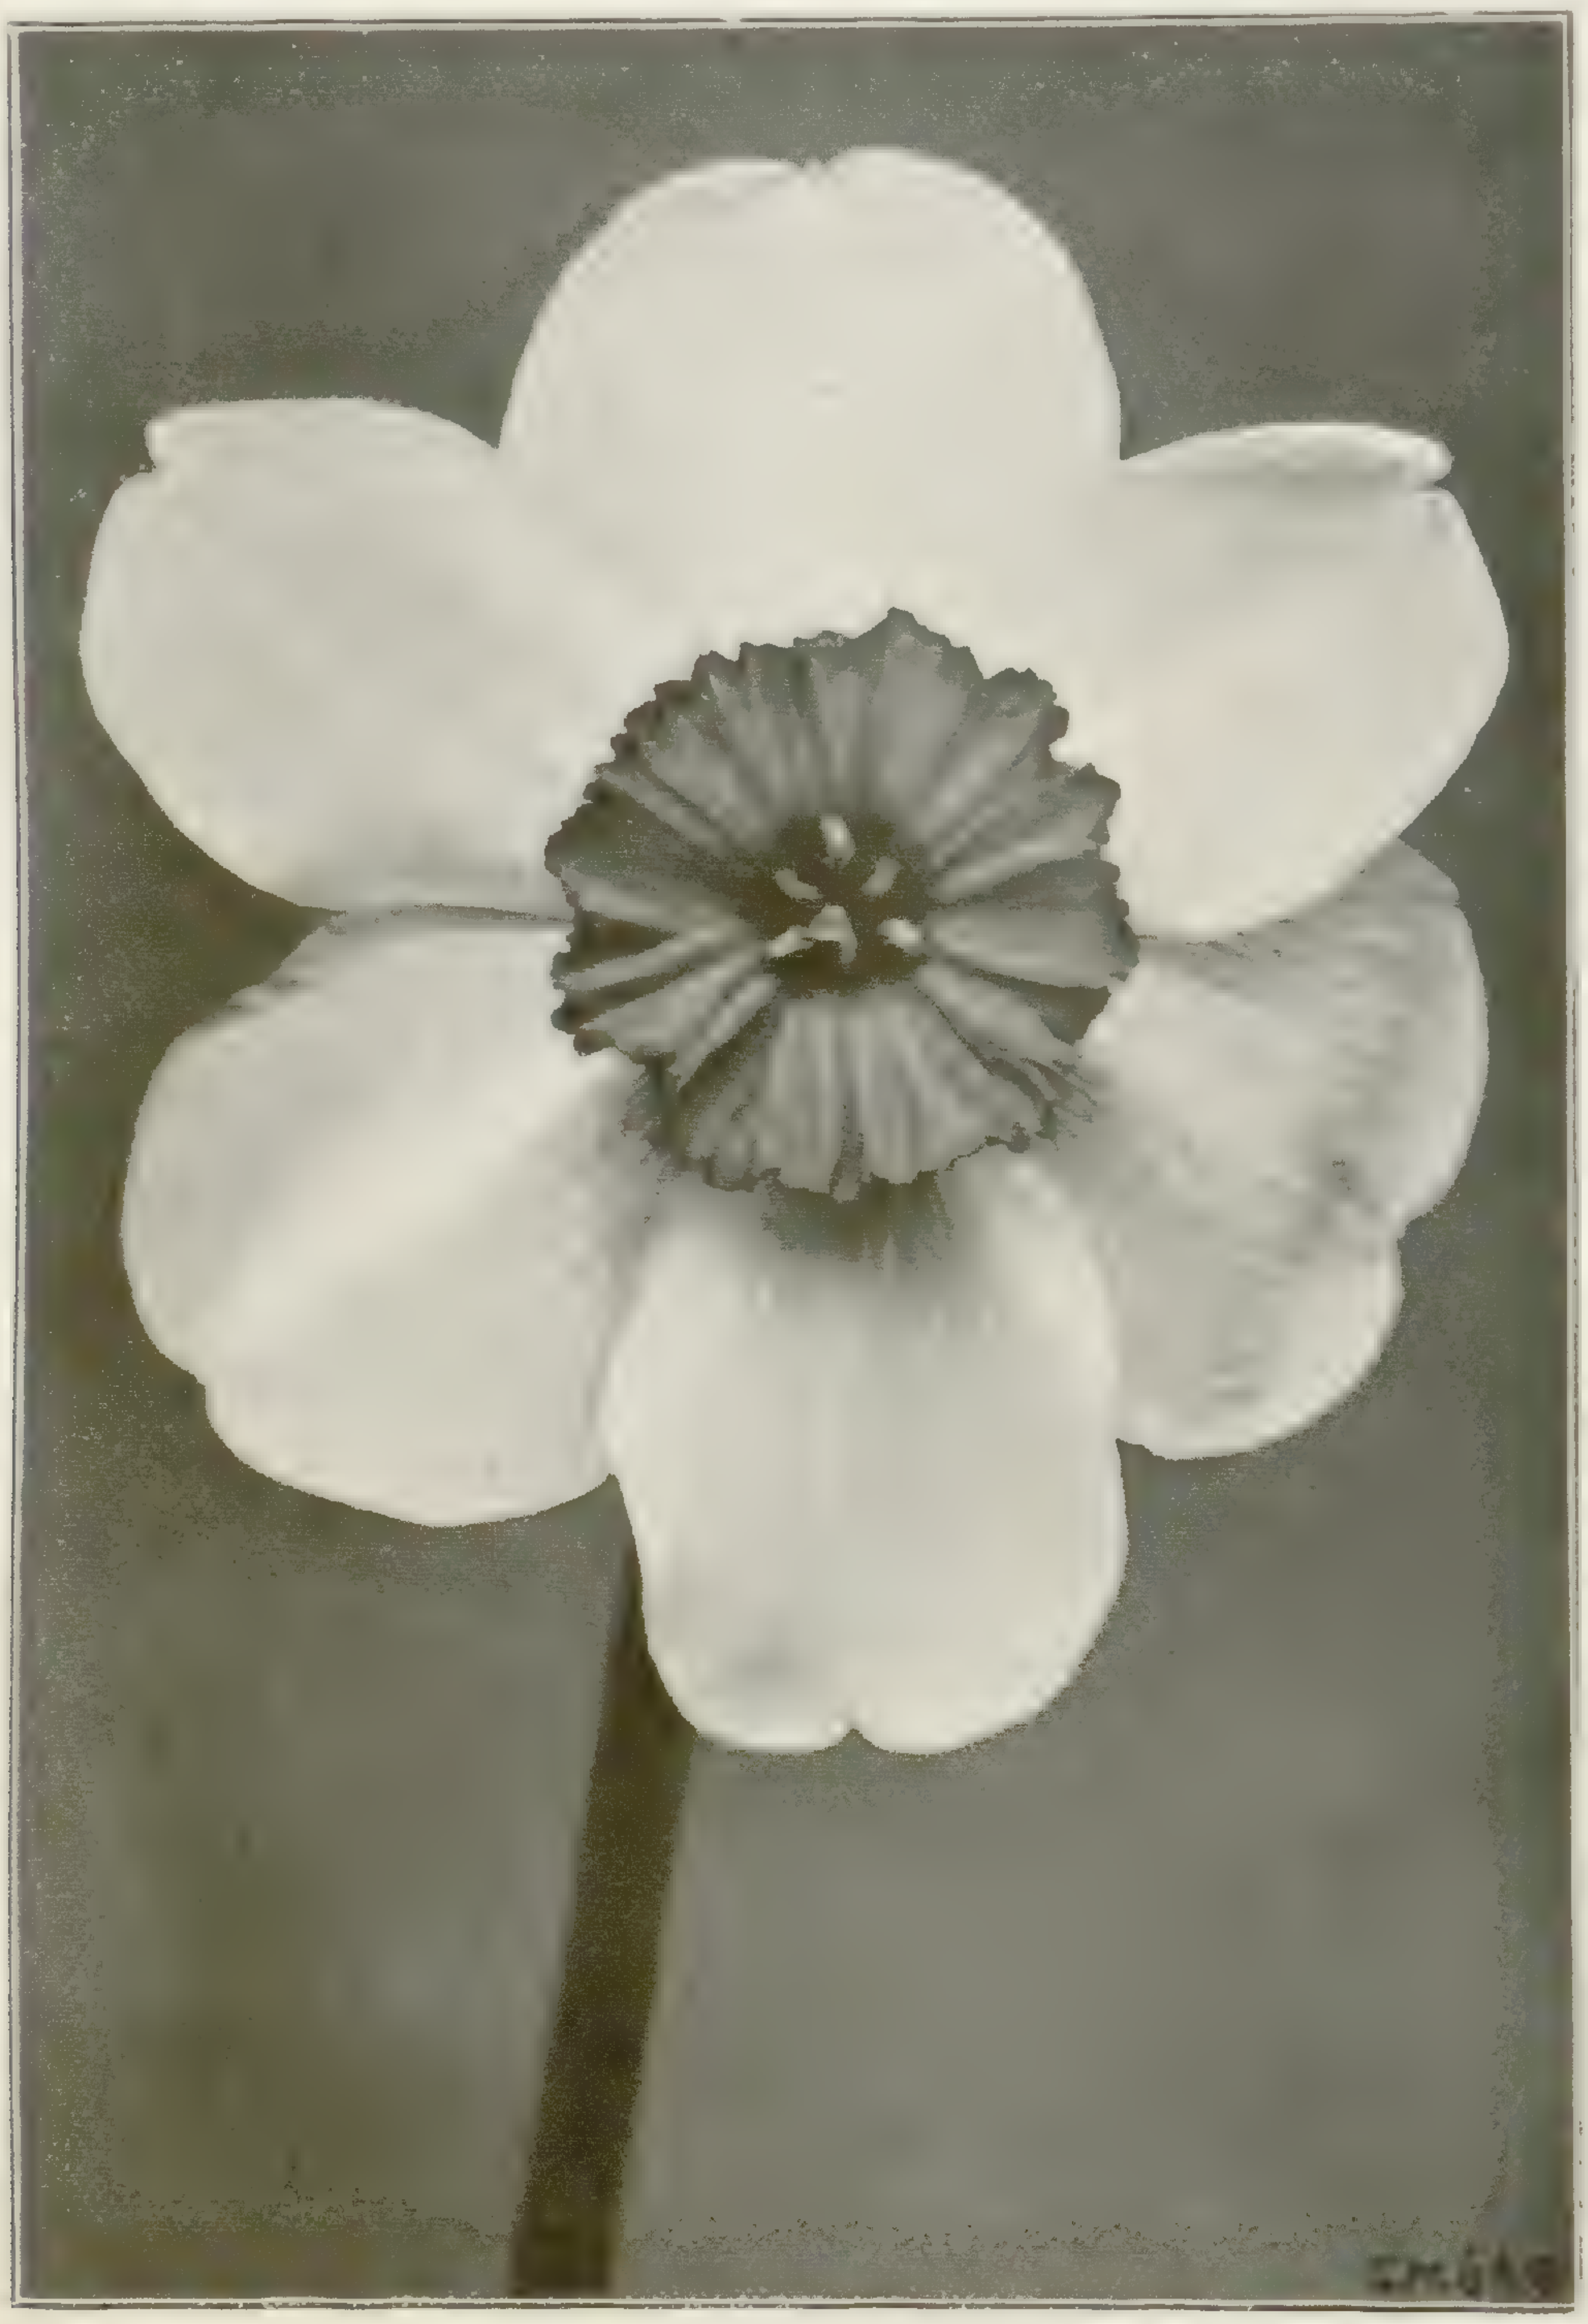
Exhibited by Messrs. Charlesworth and Co., at R.H.S. Meeting, March 9, when it received a F.C.C. Flowers considerably reduced, sepals and petals white, tinted rose, the lip crimson.

Scientific Aspect of Tillage.—Tillage, observes Professor Wrightson, in the "Agricultural Gazette," justifies itself, and needs no theory, nor apology. It is, however, capable of explanations which shed considerable light upon its processes, and may even modify them. Among these may be mentioned the aeration of the soil, or the effects of free oxidation. With this is closely connected increase in percolative properties towards water, and porosity and absorptive powers towards both water and gases. A well-tilled soil at once allows of the downward passage of water, and consequently of air, and it is capable of retaining a much greater amount of moisture than if in a compact state. It also favours the processes of nitrification to a marked degree, and allows of unimpeded ramification. Oxygen acts upon both the organic and inorganic constituents of soils, causing the complete decomposition of the one, and the liberation of fertilising matter in the other. It promotes the action of the aerobic microbes, which perform an active part in nitrification, and sweetens the soil by destroying those organic acids which are associated with partially-decomposed organic matter. Under the influence of tillage the interstices of the soil become the theatre of many important and beneficial changes, which could be only imperfectly effected without it. The exposure of fresh surfaces, and the pulverisation of the staple, facilitate atmospheric action, and assist in the liberation of both nitrogenous and mineral plant food.

NEW PLANTS, ETC.

BRASSO-CATTLEYA CLIFTONI MAGNIFICA.

An exquisitely beautiful form of one of the finest of the Brasso-cattleya hybrids, but, as might have been anticipated from its parentage, the characteristic features of the cattleya predominate. The flowers are large, the petals of great breadth, and with the sepals are white delicately tinted with rose; the rich crimson lip is broad and finely frilled. F.C.C., R.H.S., March 9, Messrs. Charlesworth and Co., Haywards Heath.



NARCISSUS CIRCLET.
Exhibited by Messrs. Cartwright and Goodwin at R.H.S. Meeting, March 9. Awarded a Certificate of Commendation for forcing. Flowers white, with lemon-coloured cup.

CATTLEYA TRIANÆ GRAND MONARCH.

A magnificent variety, not less remarkable for its rich colour than for the superb form and noble proportions of the flowers. The sepals and petals are of great breadth, and of a rich rose-purple hue, and the fine broad lip is ruby-crimson marked with gold. F.C.C., R.H.S., March 9. Mr. Menteith Ogilvie (gardener, Mr. Balmforth), The Shrubbery, Oxford.

ODONTIODA BRADSHAWIÆ COOKSON'S VARIETY.

A brilliantly coloured and exceedingly beautiful bigeneric hybrid that may be regarded as a veritable triumph of the hybridist's art. The flowers are large, as so well shown in the characteristic illustration we were able to give in our issue of the 13th inst., and the sepals and petals are of considerable breadth, as in a fine form of Odontoglossum crispum. Both sepals and petals are bright scarlet, and the sepals are tipped with mauve, and the petals have an irregular margin of the same colour; the lip is scarlet, mauve, and yellow. F.C.C., R.H.S., March 9, Mr. Norman C. Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne.

SOPHRO-CATTLEYA THWAITESI.

A beautiful bigeneric hybrid, obtained from a cross effected between Sophronitis grandiflora and Cattleya Mendeli. The flowers are of medium size, the sepals bright red, reticulated with cream colour; the petals red suffused rose, and the lip red and yellow. F.C.C., R.H.S., March 9. Mr. R. G. Thwaites (gardener, Mr. Black), Chessington, Streatham.

CATTLEYA SCHRODERÆ MRS. F. SANDER.

A pure white form, remarkable for the large size and fine form of the flowers. F.C.C., R.H.S., March 9. Messrs. F. Sander and Sons, St. Albans.

BRASSO-LÆLIO-CATTLEYA COOKSONI.

A distinct hybrid, with medium-sized flowers, attractively coloured yellow and red. A.M., R.H.S., March 9. Messrs. Charlesworth and Co.

ODONTOGLOSSUM WYONIANUM.

A charming form, the flowers white, marked on the sepals, petals, and lip with large ruby-coloured blotches. A.M., R.H.S., March 9. Mr. J. Gurney Fowler (gardener, Mr. J. Davis), Glebelands, South Woodford.

NARCISSUS CIRCLET.

A handsome variety belonging to the Englehearti group. The flowers are comparatively large, with broad white segments and rich lemon-yellow cup. Certificate of Commendation for forcing, R.H.S., March 9. Messrs. Cartwright and Goodwin, Blakebrook, Kidderminster.

NARCISSUS QUEEN OF THE WEST.

A beautiful variety of special value for forcing. Certificate of Commendation, R.H.S., March 9. Mr. Walter T. Wa Bath.

NATURALISATION OF DAFFODILS.

The naturalisation of the narcissi is one of the greatest successes ever added to our gardens and landscapes, and I very much question if these flowers are ever seen to greater advantage than when growing in the orchard, meadow, or other grass. Two common dangers, however, are often seen; first, overcrowding, in which the whole surface of the grass is dotted over, and, second, the use of mixtures instead of distinct varieties. The first destroys all good effect, the second, as we see in some of our public gardens, is also not the best way to go to work. It is only when the plants are grouped naturally and simply in the turf with plenty of verdure about them, that we get the best effect.

Nothing is weaker than a mixture of a number of forms. I do not say that mixtures are not good occasionally, for two well-chosen varieties very often go together with graceful results, but the best way is to keep them apart. Even those which, seen when gathered might be called second rate, often give, when grown in turf, most beautiful colour effects from a distance. Narcissi and other bulbs should be planted freely, and as they are offered by the thousand at very cheap rates, many spots in our shrubberies that have long been bare and unsightly should be made interesting and beautiful. It should also be borne in mind that while the narcissi of themselves are very beautiful, another and distinct series of colours must be added to them, and the best are azure-blue flowers of the mountains and northern pastures. It is when these are seen together, or in relation with the narcissi in the form of carpets, near or beneath them, that we obtain the most charming effects that any flower planting can give. We are now so near the season of daffodils that I hope these notes will quicken the interest in these lovely flowers, and lead readers to observe the fine effects that free planting will produce.

T. B. Field

Ashwellthorpe Gardens.

Protecting Fruit Blossoms.—In warm situations the early flowers on apricots and other wall trees will soon be expanding. In some seasons we may pass through this critical period without experiencing any cold sufficient to damage the blossoms, but the reverse is more often the case, so that it is advisable to have everything in readiness for use if required. If such material as Frigi Domo or canvas is used, it should be so fixed as to be readily rolled up or removed during the daytime, but where the protection consists of two or three thicknesses of fish netting, this may be left up until the fruit is well set, and the foliage grown sufficiently large to act as a protection. Whatever kind of protection is used, be careful to see that it is made perfectly secure, and not liable to come into contact with the trees when rough winds are experienced.—George Woodgate.

VIEW IN THE GARDENS, BERROW COURT.

SOME BIRMINGHAM GARDENS—II.

Perry Hall.

A fine old place is Perry Hall. The house tells of strength and comfort, and the gardens tell of long years of love and care. It is the home of Lieut.-General Sir Somerset J. Gough Calthorpe and Lady Calthorpe, and it is as a home rather than a place of occasional residence that Perry Hall and its surroundings appeal to the visitor. Stately and strong, rather than ornate, is the Hall itself. It was built in 1759, is square in outline, and is surrounded by a moat 40ft. across. Four pretty ivy-clad bridges provide the means of access to or exit from the inner garden, and, as there are stout gates to the bridges, it were an easy matter to keep out intruders. The strongly-built house, the moat, the bridges, the formal flower garden, and the straight paths all carry one back to earlier days and stirring times. But they fit in well the one with the other, and are quite in keeping with the home of a soldier.

If there is formality in the plan of this part of the garden, there is none in the planting, nor in the surroundings. There are rose-clad arbours and on the west side of the house is a very handsome pergola, also rose covered. Climbers clothe the walls of the Hall, and quite close up to the windows are raised, bricked-up flower beds, that are filled in summer with fragrant and beautiful flowers. These are very quaint and different from anything I have seen elsewhere. Both Sir S. J. Calthorpe and Lady Calthorpe love their garden and take a very personal interest in it, and though I have referred to the garden within the moat first of all, it must not be thought that this is the limit of gardening operations. By no means. Perry Hall estate is a fairly large one. Within the garden and grounds there are about six miles of roads, and the drive up to the Hall is a full half-mile long, and there is another long back drive to the stables and servants' quarters. Further, there are about seventeen acres of gardens and pleasure grounds, about eighteen acres of golf lawns, five acres of kitchen and fruit gardens, and a glass department of thirteen houses.

It is not a small garden that Mr. Thomas Burn has charge of, consequently, it is a good thing that the restless energy that characterised him when he was at Kew, about twenty years ago, seems to have in no way abated. He is never happier than when conducting alterations and improvements; the golf lawns have provided an outlet for his energy of late, but failing special work of this kind, he looks round for sites that will be all the better for being trenched. Mr. Burn loves to get to the bottom of things, and herein lies the great secret—if it can be called secret—of his success. He is an out-and-out advocate of deep cultivation, and the magnificent crops of all kinds of vegetables to be found within the high-walled kitchen garden are a striking tribute to the correctness of his views. A cleaner, better cropped kitchen garden one might long seek for. Hardy fruits are also finely managed, and though here and there, as is the case in all old gardens, there are fruit trees long past their profitably fruitful stage, these are being steadily replaced by young ones, and, meantime, there are clean, established trees of various sizes and ages that yield an ample supply. One long arch of apples in the kitchen garden is an attractive rather than a profitable feature, but it is an institution sacred by reason of its age.

Hardy flowers, annuals, and flowering trees and shrubs abound at Perry Hall, indeed there are flowers everywhere. Herbaceous borders are many in number, and one of these, backed by a high climber-clad wall, Mr. Burn hoped to be able to widen considerably, and, of course, thoroughly trench, although such widening would mean the removal of a path, the lifting and removal of several trees, not to mention alteration of drains, etc. Another improvement on hand is the planting of groups of flowering shrubs, or strong-growing hardy perennials on either side of the long lime avenue or drive. This is proceeding as opportunity serves, and as it provides room for shrubs and plants that must be thinned out in grounds nearer the hall, the work serves a double purpose, securing improvements in both cases and in an economical fashion. The curse of over-planting, and consequent over-crowding and spoiling, is alas, written all too legibly on many a garden; here is a suggestion for remedying the evil.

Very freely do the roses grow in the flower garden at Perry Hall, whether in beds or borders, or on arches, or arbours, indeed, the south front is even more of a rose garden than the west front. In the rose beds gladioli and violas are planted, and a feature is made of the varieties of Gladiolus Colvillei. Plants in tubs, such as hydrangeas and marguerites stand along the pathways, and a vase of flowering plants marks each corner of every bridge across the moat. In the centre of this garden is an ancient sun-dial with several inscriptions, such as "I tell no hours but sunny ones," "Look while you have the light," and "Shadows we are, and like shadows depart." Beyond the moated garden, through a plantation composed largely of beautiful trees and shrubs that flower in spring and early summer, with some purple beeches and golden poplars to give colour at other seasons, is the tennis court. All around it is a rather high bank topped by a hedge of Cupressus Lawsoniana erecta viridis. It is so usual to find the tennis court right out in the open, with little or no protection for the players from sun and wind, that this sheltered grass-plot proves a very distinct and pleasing variation.

ONE OF THE CONIFER AVENUES AT WYDDRINGTON.

The front door of the Hall faces the park and it is sheltered by a remarkably fine oak porch. On the opposite side of the carriage way there is a lawn, with groups of rhododendrons and azaleas. The iron fence that protects anyone from falling into the moat is completely covered with ivy, indeed, the moat is hardly noticeable along the front of the house. Further along a broad garden path curves round the rising park land and leads through a pleasant dell along by the side of the little River Wray. Broad borders of annuals, backed by sweet peas are inducements to pass along this way. Presently the path divides and one path leads upward and out into the park and the golf course, while the other keeps to the bank of the stream under the beeches and past several grand old lime trees. There are some pretty peeps along this woodland walk, just as there are some charming views from the moated garden, down the stream that supplies the moat and wanders away amid flowers, reeds, and rushes and grasses, past a pretty little boathouse, and on between the meadows.

Cannon Hill Park.

The most famous of the many parks and open spaces under the control of the Birmingham Corporation is Cannon hill Park, where Mr. W. H. Morter, Parks Superintendent to the Corporation, resides. This park was opened in 1873, and seven acres were added in 1897, bringing the total area up to 74 acres. The total expenditure on the parks maintained by the Corporation is about £21,000 a year, and in a manufacturing and thickly-populated City like Birmingham this expenditure is a very necessary one. As a matter of general interest it may be mentioned here that the Birmingham Parks lie widely apart, and for the convenience of Mr. Morter and members of the Parks Committee, a motor has been provided. One wonders how the ground could be covered and the parks properly overlooked by Mr. Morter before the provision of this means of quick transit. The various parks and their areas are Adderley Park, 10 acres; Aston Park, 50 acres; Balsall Heath Park, 4¼ acres; Burbery Street Recreation Ground, 4¼ acres; Calthorpe Park, 31 acres; Cannon Hill Park, 74 acres; Highgate Park, 9 acres; Lightwood's Park, 24 acres; Nechells Recreation Ground, 9¼ acres; Park Street Gardens, 4¼ acres; Queen's Park, Harborne, 15 acres; Rednal and Bilberry Hills, 120 acres; St. Mary's Gardens, 2¾ acres; St. Mark's Recreation Ground, about 1 acre; St. Paul's Recreation Ground, 3 acres; Summerfield Park, 34¼ acres; Victoria Park, 43 acres; Walmer Recreation Ground, 2¼ acres; and Washwood Heath Park, Saltley, 54 acres. This is a record any city might be proud of.

Enormous quantities of bulbs for the spring display and of tender plants for summer effects are used in the several Birmingham Parks, but the great flower-gardening centre is at Cannon Hill Park. The spacious park is pleasantly undulating and is fortunate in containing an abundance of large trees. It contains a large lake where boating is a favourite summer recreation, and it also contains water and rock gardens. From the main entrance a chestnut avenue runs well into the park, and on either side, set in the grass, are large flower beds. Last season a few of the combinations were as follows: Tall Souvenir de Chas. Turner pelargoniums and standard fuchsias, over a ground work of scarlet pelargoniums; a ground work of yellow calceolarias, with short pillars of S. Parker fuchsia and tall standards of Rose of Castile fuchsia; and a fragrant combination of stocks and petunias. The big raised Crown bed, composed of coleus, pyrethrums, sedums, echeverias, and alternantheras, delighted the multitude, while a border in front of a group of hollies, filled with clumps of sweet peas and columns of ivy-leaved pelargoniums was a striking feature.

Some magnificent weeping standards of Dorothy Perkins rose were specially noted, toward the centre of the flower garden, and a pair of fine trees of Pyrus salicifolius also attracted attention. A subtropical effect is produced in one section by means of tall cordylines, bold phormiums, cannas, palms, eucalypti, anthericums, etc. A number of small beds are arranged around the fine monument erected to Birmingham's sons that fell in the South African war, and a special feature is made of these for the production of spring effects. One very bold bed near by was filled with Dorothy Perkins roses trained up pillars, and a border of very fine white phloxes, with scarlet gladioli between, was a great success in the autumn. A big bed that was very popular last summer was of carpet-bed style, and represented the Union Jack and tricolor flags a further reminder of the "entente cordiale." Large beds of Gruss an Teplitz rose, and white stocks were also good, while scarlet begonias and white phloxes were freely used and with fine effect in many parts of the park.

It should be mentioned that hollies thrive finely at Cannon Hill Park, and that choice trees and shrubs have been planted wherever there is ample opportunity for their development. The cultivation of these subjects and of hardy herbaceous and alpine plants is being extended, and it may be that ere long there will be less need for such an enormous quantity of tender summer bedding plants. At present there is rather too much summer bedding, and even towards the close of a bright day in early autumn the display, as a whole, is rather too dazzling and bewildering, skilful though it be.

Berrow Court.

For a very long number of years the names of J. A. Kenrick, Esq., and his gardener, Mr. A. Cryer, have figured at the leading exhibitions in the Birmingham district, and one always finds them inscribed with prize slips fixed thereto at the great chrysanthemum show held in the big Midland City. In the gardens at Berrow Court many things are grown well, and in the glass houses it is pleasant to find big specimens of Adiantum Williamsi, A. formosum, A. æthiopicum, and A. Mooreanum, beautiful crotons, splendid examples of Dracæna Sanderiana, D. Godseffiana and a whole host of other ornamental foliaged plants. Plants and flowers of all kinds are used very largely for indoor decoration and for the embellishment of the conservatory that is practically a part of the home itself, so we find a considerable variety of subjects grown by Mr. Crier, and it must be allowed that the success he achieves is above the average.

There are many glass houses at Berrow Court, though none of them are very large, and, mostly, they have been arranged so as to occupy in the aggregate as small an amount of space as possible. No room has been wasted. In addition to a fine selection of stove foliage plants, the collection contains a fine lot of dendrobiums, for which Mr. Crier believes in a comparatively small amount of root room; calanthes that are a special success, with leaves that show no trace of spotting; streptocarpuses, representing a first-class strain in first-class style; odontoglossums, all grown in polypody fibre and looking the picture of health; zonal pelargoniums, a splendid collection of the finest varieties, grown in free, informal style and filling one span-roofed house with great beauty and brilliance; perpetual carnations, to follow the zonal pelargoniums; and amaryllis, which also have to themselves one of the light and useful houses erected by Messrs. Wright and Holmes, of Birmingham. Some patent frames by the same builders, filled with primulas and cyclamens, are worthy of notice, as they are arranged to open easily from either side, and they have a rising apex that permits of top ventilation. The amaryllis are a very fine lot, and they consist of the best of varieties from the collections of Messrs. J. Veitch and Sons, Chelsea, and Messrs. R. P. Ker and Sons, of Liverpool, and selected seedlings raised by intercrossing these.

Peaches are well managed at Berrow Court, the long peach case containing excellent trees of King George, Noblesse, Raymackers, etc., all of which fruit freely, the latter carrying a very late crop of fine fruits. There are two vineries, and though the vines are old they carry good useful crops.

Not an easy place to manage is Berrow Court garden, because of its steep slopes and curious corners, but, like almost every other garden where the owners and the gardener are lovers of plants and flowers, and where the skill of the latter is backed up by the liberality and kindly consideration of the former, it has a beauty and interest of its own that are quite distinct from that found in any other garden. Right along one side of the lawn is a pleasing combination of herbaceous border and rock garden. It is really an elevated border faced with rock work. Here, in a warm and sheltered position, large groups of such beautiful flowers as liliums, montbretias, kniphofias, crinums, heucheras, Sedum spectabile, phloxes, Michauxia campanulata, hollyhocks, etc., etc., are an unqualified success. It is no haphazard success, however; no lucky hit. The border is made of the best material, and good mulchings of manure and plentiful supplies of water, with a careful regulation of growth, do the rest.

Herbaceous plants are also freely grown a little farther along, and through this part of the garden one passes to the little rose garden where a magnificent arch of Dorothy Perkins rose was the outstanding feature for a considerable part of last season. This beautiful rose is certainly a great success in the Birmingham district. Still descending, the rhododendron garden is reached, where a good selection of these ever-beautiful shrubs is planted upon a semi-circular bank, with beds of Ghent and Mollis azaleas in front of them. It was a happy idea that conceived this rhododendron garden, and no small skill was necessary to carry it out. More rhododendrons follow, and then the little pond comes into view with a really splendid group of the bold Saxifraga peltata at either end, forming a distinct and beautiful feature.

Climbing up another way to the kitchen and fruit garden it is at once apparent that Mr. Cryer's care and skill are not all expended on plants and flowers grown solely for their beauty. This part of the garden comes as a distinct surprise just as you have concluded that Berrow Court garden is given over to plants, hardy flowers, and choice fruits. No one need ask for finer bush apple trees than Mr. Kenrick's garden contains, and especially fine is Golden Noble, Blenheim Pippin, and Lord Suffield. Close cropping is the order in this acre and a-half of kitchen garden, not a bit of room is wasted, and with peas, bush fruits, and Brussels sprouts, Mr. Cryer is as successful as with stove plants, amaryllis and chrysanthemums. The latter are largely grown, and during the summer time no fewer than seven hundred plants line the broader pathways in this upper kitchen garden. The majority are grown for the production of large blooms, but that still leaves a large number grown in bush form for conservatory decoration or for cutting from.

A FINE WEEPING BEECH NEAR THE LAKE AT WYDDRINGTON.

Wyddrington.

At Edgbaston, quite near the famous Edgbaston Botanic Gardens, there is a peculiarly interesting old-time garden belonging to Mrs. John E. Wilson. Time was when Mr. Jinks who has been head gardener at Wyddrington for thirty-six years, was in the forefront as an exhibitor in the Midlands. He was always a strong competitor with plants of all kinds, while fruits and vegetables were scarcely less well shown. But times have changed, and, though Mr. Jinks, still hale and hearty, is a strong supporter of every horticultural movement in Birmingham, he does not now exhibit. Where once was the bustle and excitement incidental to any preparation for an exhibition, there now reigns a peaceful, restful quiet.

Wyddrington is a garden of terraces and long straight alleys; a garden of fine trees, water, and woodland. A quiet garden wherein to rest and meditate, and let the world rush along outside as swiftly as it may. The house is set high above a deep valley, and one end of the valley is broadly and stoutly banked up, and along the top of the bank runs a canal that extends to Worcester. On bank and steep, and all around the lake that lies in the bottom of the valley, trees abound, ranging from deodar and Lebanon cedars to elms and oaks and fine beeches. Standing at the garden front of the house one obtains many pleasant views, and it is hard to believe such a garden could be so near a great manufacturing city.

A modest flower garden is on the topmost terrace, and the terrace bank is clothed with such spring flowers as arabis, aubrietias, saxifragas, phloxes, dianthuses, and the like, while the broad path below has an arbour of golden yew at each end. A lawn occupies a large part of the second terrace. All around are winding walks amid rhododendrons, fine hollies, and rare old conifers, but presently one comes to the long alleys or avenues, each from 100 yards to 160 yards long, and from one point five of these avenues radiate. There are eight of these quiet, straight avenues, and one of the best is of golden English yew, backed by common English yews 20ft. high; one is of Irish yews; one of Cedrus Deodara; one of Pinus Cembra, 25ft. high; another of the green Ilex aquifolia minorca, and yet others, two of the newest, of Cupressus Lawsoniana lutea. All the alleys or avenues are 16ft. wide, and the trees are only sufficiently pruned to keep them in bounds, and secateurs, not shears, are used, and it occupies three men about five weeks to do all the pruning.

Away below, to the right is the kitchen garden, so carefully hidden as not to be seen from the house or terraces; indeed so wonderful are the winding walks and so straight the alleys, that it would be a difficult matter to find the kitchen garden without a guide. Further along to the left is the lake, with its margin of pampas grass, osmundas, irises, and bullrushes, its bamboos, and its water lilies. Near by are some beautiful oaks, a noble Taxodium distichum, and at the head of the lake is one of the most perfect specimens of a weeping beech one could wish to see, and it is a big one also. The rose garden is also a distinct and attractive feature at Wyddrington.

In the spring time and in early summer these gardens must be particularly pleasing, when the daffodils and bluebells yield their charming flowers in myriads, and when the abounding rhododendrons and azaleas produce their beautiful blooms. It is good to visit a garden of this kind now and again, and wander adown its grass walks amid the stately yews and cypresses, and drink in some of the peace that broods over it—a peace that is not found in any new garden.

PART OF MANSION AND MOAT AT PERRY HALL.

Southfield.

Southfield, the residence of W. Waters Butler, Esq., is at Edgbaston, and is entered from the Norfolk Road. The house is a pretty one, the stables and yard are as spick and span as the most modern fixtures and appliances can make them, and the garden is very cosy and admirably kept. Not very large is the Southfield garden, but it is skilfully arranged and well named. Immediately in front of the garden side of the house a small, well-kept lawn extends to the railings of the meadow. Evergreen trees and shrubs, hollies prevailing, act as screens and shelter on either side, and a few well placed flower beds give the necessary colour. Beyond the lawn the pathways curve to right and left, passing round the two fields and meeting again at the far end of the little estate and at its lowest point. The garden proper extends all round these fields, showing how large a garden may be made to appear, and how infinite is the variety of design for a garden. The pretty Jersey cows and the happy donkey that is requisitioned for mowing, together with the very ornate cowshed and pigeon cote, are not the least of the attractions at Southfield.

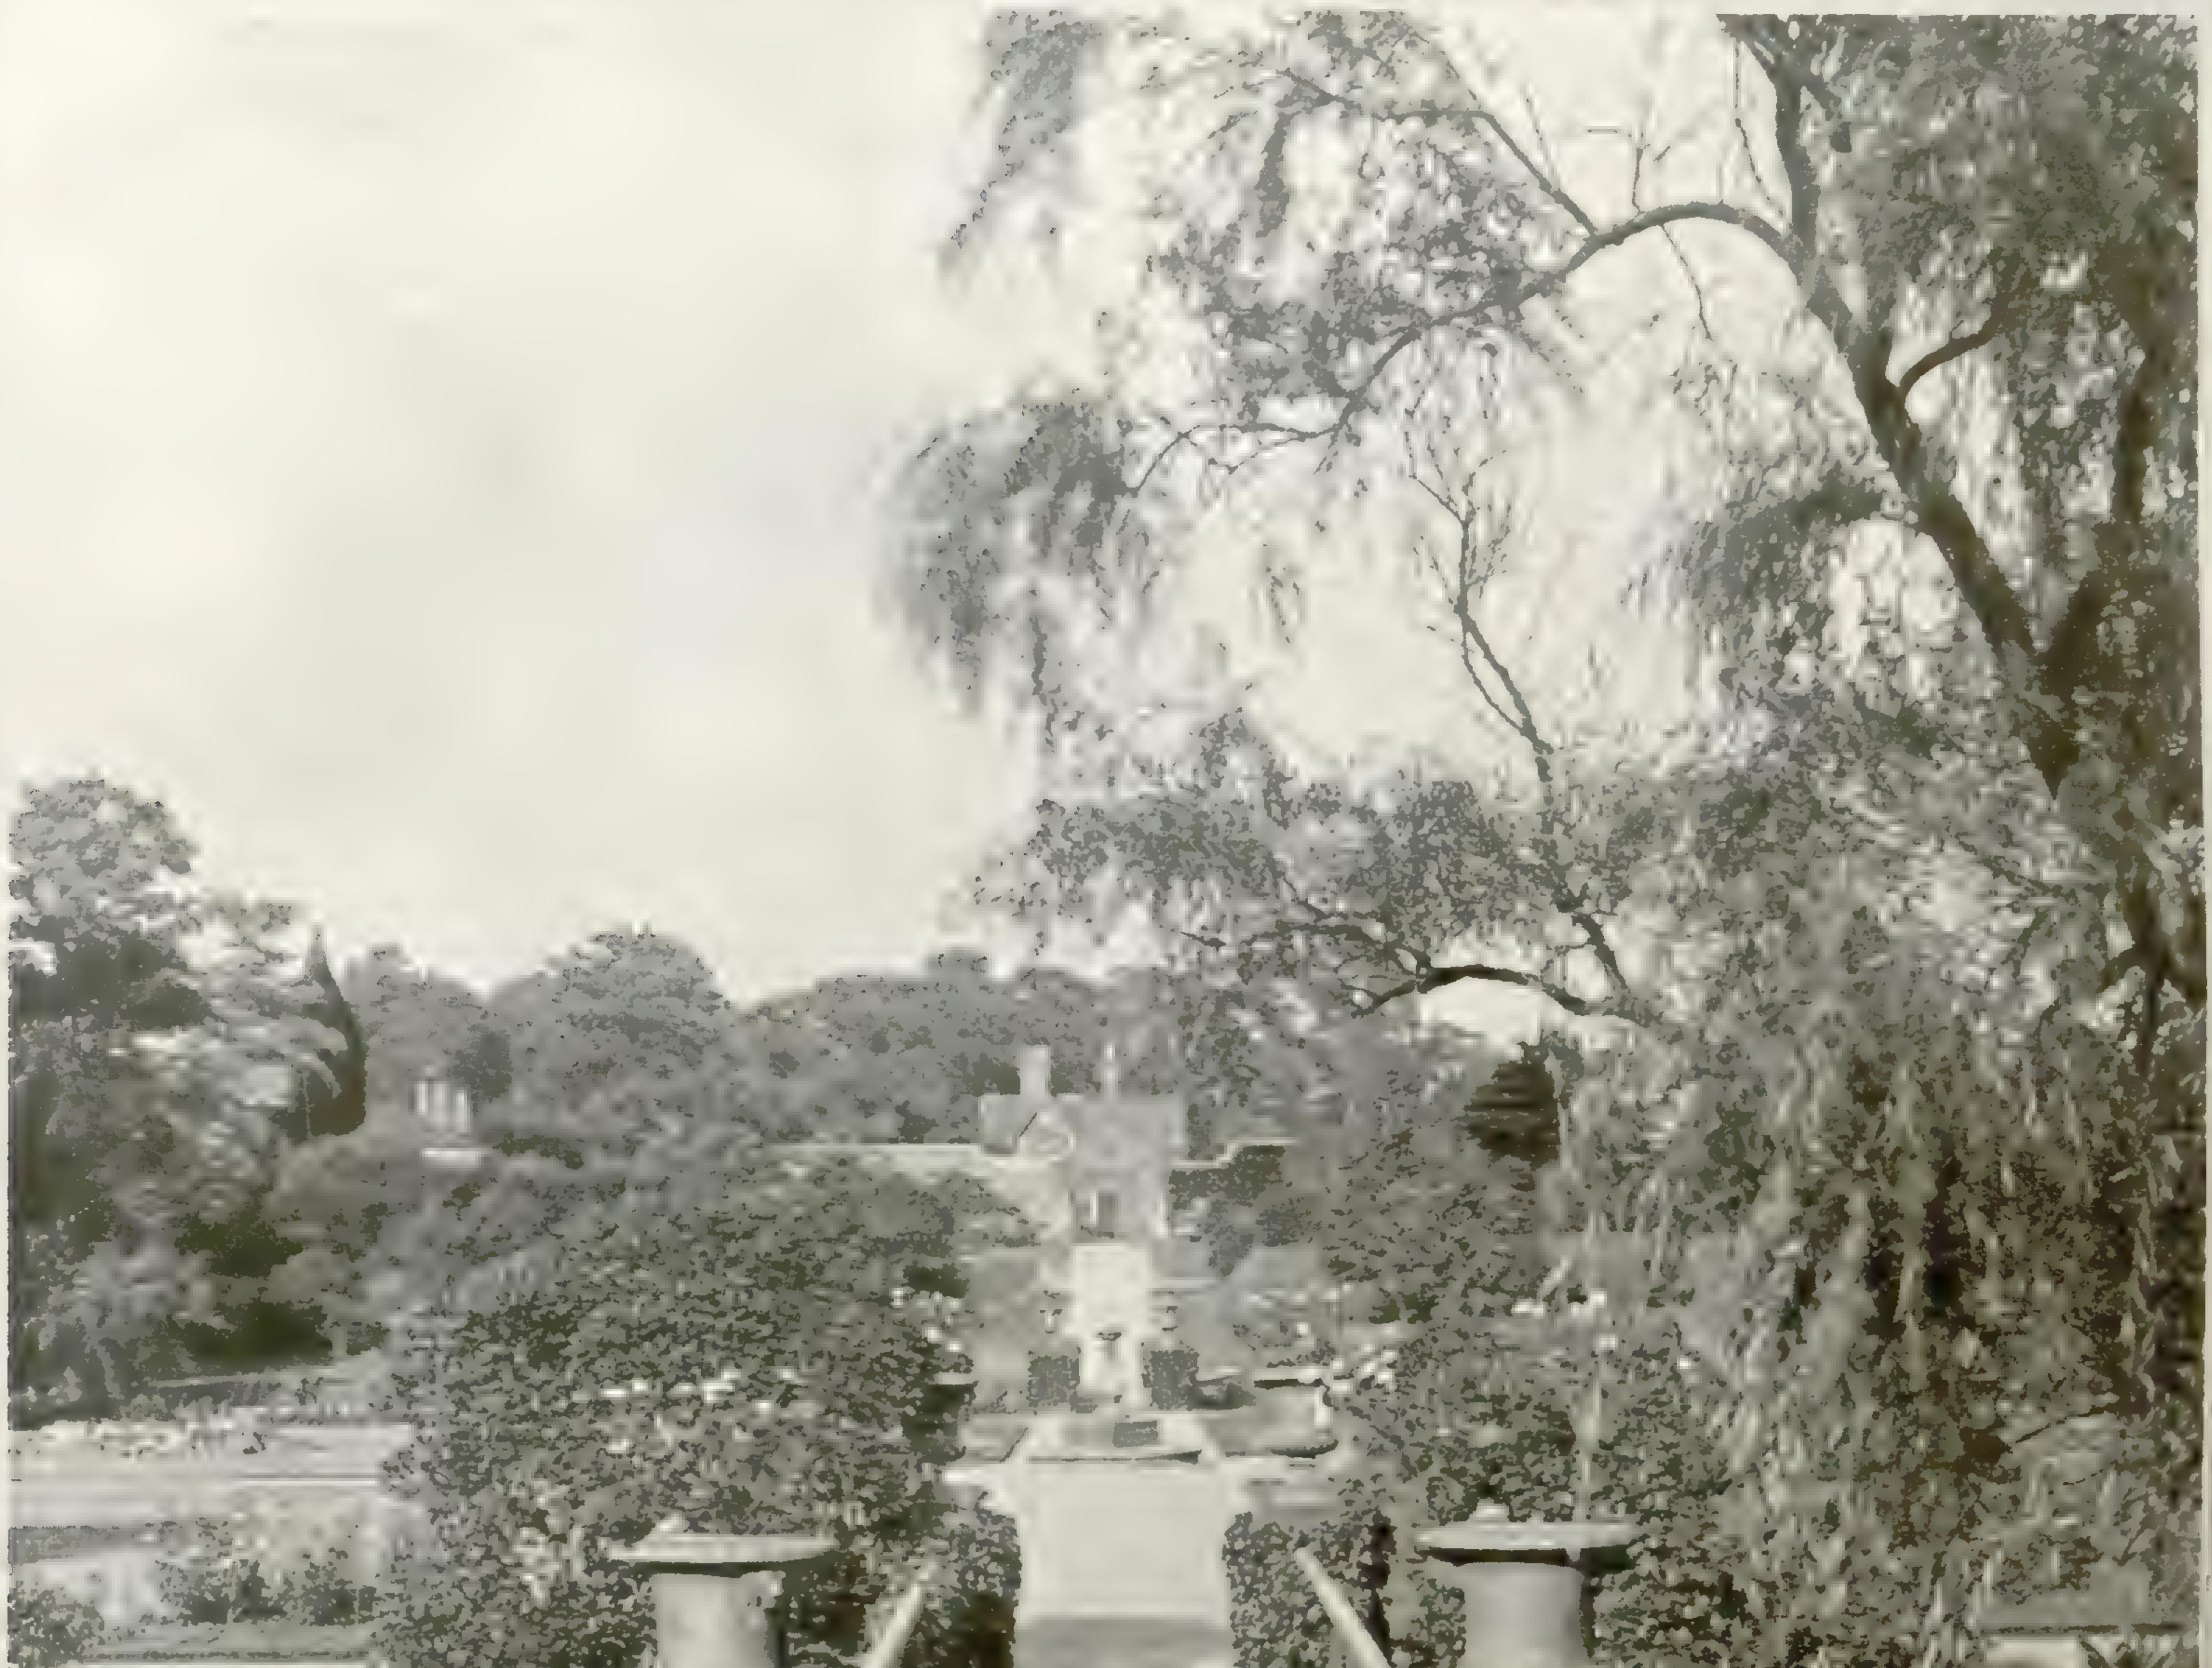
We will make the circuit of this novel and cosy garden. The glass department is in excellent order and the houses are given over largely to orchids. Mr. Waters Butler is getting together an excellent collection of these aristocratic flowers, and more houses will be a necessity if his enthusiasm continues. There are seventeen houses altogether, and twelve are devoted to orchids. The odontoglossums look very well, and they include a fine form of O. Uro Skinneri, and O. crispum Luciani, O. c. Fernley Sander, and O. Pescatorei alba represented by four plants. Cattleyas and lælias are also good and include C. gigas in fine form, L. c. calistoglossa, L. c. Aphrodite, Brasso-cattleya Mdme. Maron and many other species and hybrids. Seedling orchids fill a large part of the room, and there is a choice selection of cypripediums, though these latter do not figure so largely as in many modern orchid collections. Mr. R. Jones, Mr. Butler's head gardener, has been six years at Southfield, and the orchid collection has come into being during his period of service. It promises to become a well-known collection.

Tuberous begonias are superbly grown here, and at the time of my visit one house full of these showy plants presented a glowing picture. The strain grown is that of Messrs. Blackmore and Langdon, of Bath, and Mr. Jones told me that from a 5s. packet of seed he obtained four hundred plants, and only two of the plants gave single flowers—a fine record of fixity for the seedsman and skill for the grower.

Four years ago last autumn the smaller of the two fields was planted with groups of daffodils, and now each succeeding spring it provides an increasingly beautiful picture of charming flowers. The lawns by the side of the field have here a series of arches and pillars and chains of roses. On the left hand, and opposite the roses, are standard apple trees, beautiful and useful. Further along is the rose garden, where beds of Mrs. J. Laing, Gloire Lyonnaise, Caroline Testout, and Capt. Hayward give abundance of blooms. Beyond, the rose garden keeps closer to the meadow, leaving a broader space towards the boundary fence, and here, in this space, margined and screened with bush apple trees, is the kitchen garden. Now the walk r again and there are beds of choice h baceous plants in the well-kept lawn. w along the boundary side a big bank, raised to form a screen, is planted with hollies. In front of this bank are large groups of phloxes, pæonies, Bocconia cordata, geums, gaillardias, helianthuses, and other free-growing and showy hardy perennials.

Presently, this marginal garden widens out again, and amid the shelter of t cypresses and flowering cherries there lies an exceedingly pretty little rock and water garden. Water lilies cover the lit pool, and bamboos flourish on its bank. On the rock garden and overlooking the pretty scene is a clematis-clad summer house. No attempt has been made t obtain a particularly rare collection alpines, but popular free-growing k have been carefully planted all a Through this garden one arrives a the croquet lawn from whence the t commenced, and all around there h a continual sequence of pleasing p Said not I that Southfield was a cosy g den!

Charles H. Curtis



VIEW IN THE INNER GARDENS AT PERRY HALL.

MAINCROP CARROTS.

Probably this is one of the most uncertain of crops cultivated in the kitchen garden, except in some favoured localities where the soil and climatic conditions seem to suit it admirably: but even in such cases there are times when the crop is anything but satisfactory, and this applies to those specially cultivated for exhibition purposes, as well as those grown in the ordinary way for home use. I am a great advocate for making several sowings through the spring and summer, on various sites and aspects, rather than trust too much to one or two maincrop sowings. Not only for the reason that one is much more likely to be successful at one or other of the intervals, but tender young roots are generally much preferred, and they are certainly much better than old, matured specimens. Nevertheless, it is essential in many places, and under various conditions, that the principal sowing should be made at a given time, and the best season for this varies from March 20 to April 20, according to the locality, soil, and condition of the weather.

VIEW IN THE FLOWER GARDEN, PERRY HALL.

Preparation of the Ground.

This is unquestionably the most important detail in relation to successful culture. The site selected should be an open one, and if the plot has not been manured to any extent for the past two or three years, and especially with farmyard manure, so much the better. Trenching should always be practised early in the new year, and in doing this take special care to bring up the subsoil to the surface, and should this be of an unkindly nature, do not hesitate to apply a thorough good dressing of some lightening material. Whatever may be most convenient should be used, but there is nothing I have found of so much value as burnt garden refuse, and one can hardly overdo the ground with this. Soot, lime, old mortar rubble, sand, disused hotbeds, and, in fact, anything that helps to make the soil lighter may be used

Sowing the Seed.

The surface should be forked over a few days prior to raking down the beds for sowing the seed. Shallow drills should be drawn about fifteen inches apart, and the seed scattered thinly along these. Before raking soil over the seed apply another good dusting of wood ashes or soot, and the surface should be raked down very evenly, and made firm. To ensure extra fine specimens for exhibition or competitive purposes it will be necessary to make good holes with an iron bar fifteen inches apart each way. The depths for intermediate or long kinds should be not less than three feet. These should be filled with finely sifted soil in a moderately dry condition, which can be prepared on wet and inclement days during the winter. The material should be a light sandy one, nothing being better for the purpose than old soil from the potting shed that has been passed through a quarter-inch mesh sieve, but failing this, an endeavour should be made to procure that which resembles it as nearly as possible. In all cases the soil should be free from wireworm. A few seeds should be sown in each hole, and covered to the depth of an eighth of an inch, and made firm.

The Growing Crops.

As soon as it is safe to do so the seedlings should be thinned out in the drills, leaving them sufficiently close to allow for the young roots to be pulled as required. The hoe should be frequently used to stir the surface, but the ground should be made very firm by treading, to prevent the carrot fly depositing its eggs on the roots. Those in the bored holes should be thinned to a single plant, of course leaving the strongest, and also the one nearest the centre. I have found it a capital plan to place a little silver sand round the crown of each of these, and if done when quite young the fly will seldom deposit its eggs upon them. These, too, should be constantly hoed, and soot should be frequently applied, at least once in every ten days. On poor soil some good artificial fertiliser should be given, as per directions. But the soot and the artificial should, as far as possible, be applied during wet weather. It is a capital plan to mulch carrots after they have made good growth with finely sifted leaf-soil or manure from an old mushroom bed. This will assist in conserving the moisture during spells of drought, and prevent the ground cracking, as well as preventing the crowns becoming green, which is always objectionable. In no case allow the crop to remain too long before lifting or many of the specimens will become cracked and spoilt, and they may become over large.

Enemies of the Carrot.

Ground game have a great liking for these, and must always be guarded against. Wireworm is most troublesome, and means must be taken to prevent the pest injuring the roots. Deep tillage of the soil and exposing it early will do much to eradicate this, and I have found Vaporite, when properly applied, excellent. Greenfly is frequently very troublesome, and when the young seedlings become badly infested syringe with strong soft soap and water, or dust with tobacco powder. The carrot fly is perhaps the most troublesome of all, and frequently it will ruin the whole crop. There are many remedies suggested for this, but I have found nothing more effective as a preventive than keeping the soil thoroughly firm close to the young plants after thinning.

Varieties.

There are now some very choice stocks, the best and most popular being New Intermediate or St. Valery, of which there are many stocks. Long Surrey is only suitable for very favoured soils. Among the stump-rooted kinds Early Nantes, Model, and Favourite are desirable varieties, and well adapted for shallow soils.

Edwin Beckett.

CHRYSANTHEMUMS.

The First Potting.

Whether chrysanthemums are grown for the production of large exhibition blooms, for home decoration, or for cutting, the initial stage of growth is of first importance. It is well known amongst successful cultivators that a chrysanthemum should receive no check from the time the cutting is taken to the final stage when the blooms are fully developed. If there is one period more than another when a check to growth is undesirable, it is when the plants are needing their first shift to larger pots.

SOUTHFIELD: MANSION AND TENNIS LAWN.

Assuming the cuttings were inserted singly in small pots they will now require shifting into those 4in. in diameter. From these they will go into others 6½in. wide, and from that into those they are to flower in, which are usually 10in. in diameter. It sometimes happens that it is a convenience to grow two plants of the same variety in one pot. This is economy in space and in pot room too. I would point out, however, I am now alluding to plants that are grown for the production of large exhibition blooms and not "bush" plants, from which come quantities of flowers in sprays.

The pots should be quite clean inside, because the plants are then more easily transferred to larger pots next time; the roots cling to dirty pots and are torn asunder when turning the plants out for potting. Efficient drainage is a necessity, to preserve the green tint of colour in the leaves, which changes to a sickly hue if the roots become damaged by imperfect drainage and an irregular supply of water. Because a chrysanthemum plant is a voracious feeder, needing much moisture at the roots when in a healthy condition, it is a mistake to think it cannot have too much water at the roots. Many instances of loss of chlorophyll in the leaves, especially in March and April, have been traced to an over-plentiful supply of water to the roots. This defect in culture is quite easily corrected if the plants are kept rather dry for a couple of weeks.

A very rich or special compost is quite unnecessary for good chrysanthemums, although the soil plays an important part in the welfare of the plants. What is added to it afterwards in the shape of manurial feeding, and a regular water supply, is of equal importance. Three parts sweet turfy loam to one part of half-decayed horse manure, with the addition of sufficient sharp silver sand to keep the whole porous, and a small quantity of Thomson's vine manure or bonemeal, will provide a desirable compost.

Pot firmly, so that the roots will be mainly of a fibrous character, which is not the case where the soil remains loose. What is required is growth that will be of a firm character as it proceeds. I am a staunch believer in ripe or matured wood even in a chrysanthemum, because I do not think high-class blooms can be had from any other type of plant; gradual maturity, much aided by firm potting, is desirable.

At this stage an unheated frame or pit is the best place for the plants, as here the growth is sure to be short jointed, except there be too little space given, and they then become drawn up weakly. This is an error which no experienced person will commit, but the inexperienced may, and for such I write. Too often frames or pits are not available; a cool house, or peach case, with a shelf supended near to the glass is the next best site. Here the plants will obtain plenty of light and air.

SOUTHFIELD: COW-SHED, PIGEON COTE, AND DAIRY COWS.

Carefully supply the roots with water, that of a soft, tepid nature being best. Plants progress much better under such favourable conditions than they do when treated in a haphazard manner. Keep the plants in the frame rather close for a few days until new roots are being made, and after that air in abundance should be given, even to drawing the lights entirely off the frame in suitable weather.

Keep a sharp look out for mildew and aphis. The former is easily got rid of by dusting the leaves with brown sulphur. Green and black aphis are at times troublesome to the points of the growth, and if allowed to remain long undisturbed will quickly check progress, crippling the young leaves. Tobacco powder dusted on the aphis will quickly get rid of the pests. If it is a bad case, where the leaves are curled up, and hide the aphis, then dipping the points of the shoots in tobacco water will be necessary.
E. Molyneux.
Swanmore Park.

ADIANTUM FORMOSUM.

This fine adiantum was introduced into England about 1820, and, as its name implies, it is a beautiful fern. Though growing most rampantly under moderately warm treatment, this species will succeed fairly well in an ordinary greenhouse or cool fernery. Grown as a large specimen its magnificent dark green fronds are imposing, and where decorative plants are used largely specimens of this fern should always be grown, as its appearance is so distinctive that it adds charm to large groups wherever they may be arranged. Spores of Adiantum formosum seem rather rare, for it is seldom found springing up amongst other ferns in the seedling state, and it is therefore propagated by division of the roots, and every small piece will grow. The roots are very eccentric in their manner of growth, properly they are rhizomes; they run about in the pots or pans and often take a downward course towards and amongst the potsherds. They are very brittle and snap suddenly when bent in the slightest degree. The new fronds push out at intervals along these creeping rhizomes.

To produce large specimens it is the best plan to place three small examples together, towards the centre of the pot, in which position they soon grow vigorously. A plan that sometimes obtains is that of breaking the ball up and selecting all the rhizomes out, especially the growing ends, and fill up the pot to within two inches of the surface with the compost, and carefully spread out the rhizomes on it and cover them carefully. But this method has a tendency to weaken the growth by reason of the sudden and severe check imposed. Another reason why it is the best plan to put two or three small plants together in the centre of the pot is, that by adopting this method the middle will be well furnished with young fronds, whereas with old plants the fronds spring from the sides of the pot as the rhizomes mostly strike outwards from the centre, leaving that part bare.

When filling up interstices in the rockwork in the fernery, this is a very useful fern, as it can be planted in somewhat deep crevices and its tall fronds will spring up in a pleasing manner. Adiantum formosum is not very useful in a cut state as its noble fronds, so beautiful to look upon, soon dry up and wither away. It must likewise be given a good supply of water when growing, as it is very impatient of drought. The best compost is prepared with loam, peat, and leaf-mould, mixed rather roughly, being careful to retain the fibrous parts. The proportions should be half-loam, one-quarter peat, and one-quarter leaf-mould. Add, if possible, a sprinkling of broken charcoal, and give a liberal amount of silver sand. Pot rather firmly, and allow a fair amount of room for water.

Cheshire. W. M.

February Weather.—The rainfall here was only just over half an inch, namely, .53in., and that of January 1.27in. Frost was registered on 25 nights last month, 15 degrees on the 23rd ult. being the lowest recorded. On March 5, 21 degrees of frost were registered, this being quite exceptional at the commencement of the present month in this district. Notwithstanding the abnormal weather, the camellias out of doors are all looking well. Many flowers under the foliage that were out were cut, but this only served to thin them. There are thousands of blooms that have to expand.—W. A. Cook, Leonardslee Gardens

WATER AND ROCK GARDEN AT SOUTHFIELD.

ANTIRRHINUMS.

For some years past these plants have been growing rapidly in favour for the summer decoration of our flower beds and borders. Perhaps from the old florists' point of view some of them lack form, but it cannot be said that there is a lack of colouring about the numerous present-day strains, whether they be dwarf, intermediate, or tall; indeed, there are most pleasing and artistic shades to be selected from each section. The present time is a good one to sow seeds for a summer display, and if the seeds are scattered evenly and thinly upon any ordinary soil, lightly covered, and placed in a warm house for a few weeks to germinate and give them a start, they will make very useful sturdy plants in these self-same boxes, ready for transferring to the open borders or beds during May.

Antirrhinums are a class of plants that should appeal to all who are desirous of economising, for a packet of seed will produce a great number of plants that practically take care of themselves when once established in their flowering positions. Orange King was very greatly admired here last summer, and it is so toned that it is never misplaced even in the mixed borders. In this intermediate section there are pink and carmine-pink shades, also crimsons, yellows, and whites, the latter a very telling and beautiful plant for flower beds. These varieties are more telling than the very dwarf ones, which are often formal and stiff, while the taller section are apt to be broken unless support is supplied in some form or other. Golden Chamois is a fine and effective colour amongst the tall ones, while Coral Red, Cloth of Gold, and Tall White are good. Mixed packets of this strain give great pleasure when grown in the vegetable garden, and for producing a great quantity of cut flowers they are invaluable, especially as they are perpetual flowering until stopped by sharp frosts.

The Tom Thumb section has a great number of admirers, and very fine the plants are when well grown, although of dwarf stature their flowers are exceptionally large and usually of good form, they have also been well selected for a good number of years, and are very true to colour and habit of growth; Yellow Prince, White Queen, Crimson King, and Old Rose are all of them good. Apart from their beauty when grown in beds of distinct colours, many of the quieter tones are admirably adapted for planting under standard and half-standard roses, and are preferred by some to such plants as violas and pinks or carnations, because their flowers are bright over a longer period.

On light poor soils young antirrhinums from July sowings usually winter well, and also flower earlier than spring-raised seedlings. Those not having glass accommodation should certainly select a poor, dry, sunny spot for raising seedlings in this way, and excellent and useful plants will be obtained. Charles Foster

Agapanthus Mooreanus.—The blue flowers of Agapanthus umbellatus are familiar objects in many gardens during autumn, being almost exclusively employed as tub plants for the embellishment of terrace walls and similar positions. The [illegible] is a very popular one, so that it appears singular that Agapanthus Mooreanus should be entirely neglected; yet it is perfectly hardy and produces the same bright blue [illegible]. The foliage is strap-like, shorter, [illegible] erect, and the flowers are in umbels [illegible] two-feet stems. It is less suitable for [illegible] tubs than umbellatus, yet in many [illegible] it would prove a decided gain, as [illegible] flowering qualities are constant, and [illegible] well into autumn. At the same time [illegible] always earlier in flower by a month, and calls for no protection to safeguard it from loss or injury during winter, as it [illegible] in the open border here without any protection in winter.—Thomas Smith.

PLANT NAMES.

One of the most puzzling things with which the amateur flower lover has to deal is the name of the plants concerned, and the deeper he dips into the subject the greater, as a rule, his puzzlement becomes. The large majority, of course, are satisfied to deal with popular plants bearing fancy names, sometimes of a partially descriptive character, such as Crimson Rambler, but, as a rule, no more indicative of the real nature of the plants than the names Brown, Jones, and Robinson are indicative of the individuals bearing them. Hence, it is only by actual purchase that they become really acquainted with the plants, though by reference to the descriptive, or, better still, the illustrated catalogues of reliable nurserymen, they may be able to form some idea of what they may expect.

Here, however, art is too often in advance of Nature. "Perfection," "superbissimum." "Ne plus ultra," etc., etc., are represented by, or even photographed from, plants which have been so skilfully cultivated that they no more represent what the amateur can grow than the fat cattle at the great shows represent the oxen and sheep of the ordinary farmer. It is, however, when the amateur begins to study the botanical names of plants that he finds himself on the verge of a veritable slough of despond.

With immense study he familiarises himself with a number of the names, only to find that presently many of these, for reasons he cannot grasp, have been rechristened by experts with totally different apellations, the tritoma of to-day is the kniphofia of to-morrow, the familiar convolvulus is a calystegia or ipomæa, and so on, so that in endeavouring to obtain what he expect to be novelties, he only succeeds in acquiring fresh specimens of old familiar friends. Very often research reveals the fact that one and the same plant has been christened by different godfathers with half a dozen different names, and even the botanists themselves are divided in opinion as to the eligibility of these, and choose them accordingly on different lines, making confusion worse confounded. As the number of plants brought into cultivation is ever increasing, new regions of the earth being ever explored, and yielding their distinctly characterised flora, these difficulties are constantly increasing in like ratio. Not only this, but since man has come in as one of the main factors in producing new forms by crossing and hybridising, and by profiting by natural "sports" to improve abnormal types by selection, another immense field of diversity has been created, and the consequent difficulty of individualising the results by appropriate naming is augmented accordingly.

So great has this difficulty become that an international congress has been held in Vienna, with the object of formulating some definite laws to be observed in nomenclature, with the view of instituting at least a check upon the ever-growing chaos. The result, however, to the "man in the street," or the general run of amateur gardeners, is simply brain-racking. Page after page of rules for guidance or observance show, on perusal, such a multitude of inevitable exceptions, reservations, recommendations, vetoes, suggestions, etc., that with the best will in the world, and with every appreciation of the magnitude and difficulty of the task, and the competency of the high authorities by whom it has been undertaken, it seems to us very doubtful indeed that its practical utility will be commensurate with its intrinsic merits. So much confusion has been inherited and handed down as a basis for the existing nomenclature, and so much of this has become part and parcel of all existing lists and catalogues, that it is practically impossible to formulate a scheme with a thoroughly logical basis.

If this applies to the normal types of genera and species, how much greater does the difficulty become when, as appears to be the case, all these are liable to modifications on more or less marked lines by "mutation," while, at the same time, man is finding, as in the case of orchids, that even generic differences may be no bar to hybridisation, and that the hybrid offspring so produced need not be, as hitherto assumed, infertile, so that multigeneric combinations are practicable to an unlimited extent. No language on earth, ancient or modern, is capable of providing descriptive names to meet such an inexhaustible demand.

C. T. Druery, V.M.H., F.L.S.

ROSE MARECHAL NIEL.

Sent out by M. Pradel almost fifty years ago and still by far the best yellow rose, is a good proof of the merits of this rose. The chief use made of Maréchal Niel is as a climber under glass, and here no rose does better or is more pleasing. In the open it needs a very warm and well-sheltered position. I have seen it when a large space was simply yellow with blossom, but to have it really good out of doors is rare. It is too tender, and, like most roses with this trait, has a tendency to make very early growths that seldom escape the spring frosts; it also continues to grow late in the season after this check, with the result of only semi-ripened wood. Perhaps no rose is in more need of well-matured growth than this, so that it cannot be grown successfully in the open, except in a few favoured spots.

But under glass it is invincible. Given only a very little shelter, and with just sufficient artificial heat to secure freedom from frost after it breaks into growth, and to enable us to maintain a dry atmosphere during a spell of cold fog, we can have Maréchal Niel in its grandest form. Canker is its worst enemy, and unfortunately this is about the most difficult to combat. There are many ideas about this disease. Some insist upon certain stocks, others that the Maréchal Niel must be worked upon some other rose, such roses as Gloire de Dijon and the Banksians are especially favoured. So far as my experience has gone there is not much in this theory; soil and treatment having much more to do with the matter than stocks. I have tried several plants in all ways before arriving at this conclusion. Frequently the rose is placed in some corner of the greenhouse, perhaps close to the furnace or a very warm wall, or it may be where the roots can soon reach some most unsuitable soil. Another cause appears to lie in injudicious pruning. To cut back the whole of the growth at one time directly the main crop of bloom is realised, and the plant in full vigour must affect the roots. Both stock and rose need to grow in fuller harmony than could possibly be the case under these conditions. It is a singular fact that when one plant has failed from canker, a second one, even though apparently treated the same, will often thrive on the same spot. I am no believer in having this grand rose upon its own roots as a preventive of canker. Give a good root run, let the soil be rather heavy, and prune by degrees, and the results will be satisfactory.

A. Piper.

THE EDELWEISS.

Interest has for long centred around this well-known gem of the Alps, generally spoken of as the Edelweiss. Its quaint beauty, its adaptability for the rock garden, together with its "difficult" nature in many gardens, combine to make the edelweiss an essential subject for the rock gardeners' attention. Although the common form is ranked as specific, it is an open question as to whether Leontopodium alpinum is the original species or not. The edelweiss is doubtless one of the survivals of the last glacial period, and was most probably a migrant from Northern Siberia, where the varietal form (or perhaps the original species), sibericum, exists in quantity at the present day.

One further favours this idea of migration, because in other mountainous districts of Europe and Asia other well-defined varieties are to be met with, the majority of which are finer than the reputed species. There is the Russian form, altaicum, from the Altai Mountains; the Himalayan variety, himalayanum; and L. a. transylvanicum, which inhabits the Austrian ranges. In addition, there is maximum, a giant form found in Switzerland, which is more closely in keeping with the Russian and Siberian varieties. Certainly all the varieties follow the type in form.

But doubtless the influence of the different localities has done much to promote the differences in height and size which distinguish them from each other. Natural selection may also have done much to promote these differing points, as in some localities better and stronger seedling forms may have been produced, which have, by reason of their superior qualities, gradually ousted the "meaner type" from their quarters. Certainly, where the several forms of the edelweiss can be secured, they should be introduced into the rock garden, together with the Japanese edelweiss, L. japonicum. This latter is a large, erect-growing kind, with flower heads that are remarkable by reason of their size and silvery whiteness

With reference to their introduction into English rock gardens, I would advise that wherever possible, seed should be procured. Easy of germination (the chief trouble is the danger of damping off by reason of excessive moisture), one can with a little care raise a good batch of healthy little plants. Grown steadily, under hardy conditions, and allowed to suffer no checks, one soon comes to realise the advantage of home-grown seedlings over established stocks. Planted in open chinks or well-drained ledges of the rock garden, in a mixture of sandy loam to which has been added some lime rubble, the leontopodiums should soon establish themselves. Excessive moisture is the great enemy, therefore an outstanding crag, or a sheltering boulder which will protect them from the fall force of the south-west rains is a distinct advantage. It is always well to sow a pinch of seed every season, as even in good surroundings flowering makes such a big demand upon the strength of the plant that it is well to have a few sturdy young seedlings to take the place of exhausted specimens.

H. P.

A Fine Early Radish.—Carter's Early Favourite, grown in a spent hotbed, where asparagus has been forced, was ready to pull in a month from the time of sowing. It is a fine variety for frame culture, for it is not only rapid in growth, but remarkable for its delicate flavour.—W. A. Cook, Leonardslee Gardens.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

DECIDUOUS DENDROBIUMS.—As the various species and hybrids belonging to the deciduous section of dendrobiums pass out of flower the plants should be placed under growing conditions. As soon as the growths have attained a length of a few inches they, in most cases, commence to produce new roots. When in this stage any repotting or top-dressing that may be found necessary should be attended to without delay. These new roots are exceedingly brittle, and, therefore, where the plants can have attention before they become far advanced there is less danger of their becoming damaged in the process of repotting. A compost of about equal portions of fibrous peat and chopped sphagnum moss suits the whole of the dendrobiums. The principal point to be observed is to see that there is not a great bulk of potting compost about the base of the plants. To avoid this use ample drainage, and see that the compost is fine and open.

PROPAGATING DECIDUOUS DENDROBIUMS.—To increase the stock of any desirable varieties the back pseudo-bulbs may be cut away and laid on a bed of moss in a moist position of the stove or hottest house; or better still, if a propagating case is available, lay the pseudo-bulbs on a bed of cocoanut-fibre refuse, and keep them moist and close. They will then break freely from most of the dormant eyes which have previously failed to produce flowers. When the young growths have reached the stage when they commence to produce roots, they may be carefully cut away from the pseudo-bulb, or a portion of the pseudo-bulb may be taken away with the young plant and be potted in a compost of finely chopped sphagnum moss and silver sand. As soon as the roots begin to run freely in the potting compost the plants may be subjected to the same treatment as the larger examples, and be placed under the conditions conducive to the promotion of growth advancement. Another method of propagation, and one that is profitable, when dealing with pseudo-bulbs that have failed to flower, is to cut them into lengths each having two or three nodes, and insert several together around the edge of small pots filled with a compost as advised above. If the pots are plunged in a bottom heat, or suspended in a moist position of a hothouse, they rarely fail to produce growths. These may be allowed to grow on in the same pots for the season, or if desired they may be taken out immediately the new roots make their appearance, and be potted separately.

EVERGREEN DENDROBIUMS.—D. thyrsiflorum, D. densiflorum, D. Farmeri, and others of this section will now be commencing to produce their flowers. These dendrobiums are not so much appreciated as their merits deserve. Where there is a demand for plants in flower for decorative purposes during the latter part of April and May, there are few subjects that are more serviceable. Well-flowered specimens are extremely beautiful, and when used for general house decorations D. thyrsiflorum is especially effective. The plants that are beginning to produce their flower buds should now be given greater encouragement, and in bright weather syringing the plants overhead is most beneficial, but syringing should be done sufficiently early in the day to permit of the moisture becoming evaporated, and the foliage dry before the evening temperatures are reached. Potting requirements may be attended to after the plants have passed out of flower. They should not be disturbed for repotting purposes more frequently than is absolutely necessary. If the surface moss is removed, and annually replaced with fresh, all that is necessary will have been done, providing the compost beneath is in a good state of preservation.—H. J. Chapman, Oakwood Gardens.

FRUITS UNDER CLASS.

PEACHES AND NECTARINES.—Where the fruits of these are swelling rapidly the trees must be kept moist by syringing twice daily. If the borders are at all dry give a thorough soaking of water about 20 degrees warmer than the temperature of the house, and thus prevent a lowering of the temperature of the border. Cold water may give such a check to the roots as will result in the loss of the crop. The borders may now have a mulching of spent mushroom manure, which should be spread over the surface to form a 1½in. layer. The second house, in which the blooms will have just set, should have a watering; this will give the necessary impetus to the young fruit. Raise the temperature 10 degrees by day and 5 degrees by night, and allow plenty of air when there is strong sunshine, but avoid exposing the foliage to cutting winds. Trees in the late houses that are coming into bloom should have attention each day, and about noon, when the pollen is dry, give them a sharp knock to ensure its dispersion. If aphis makes its appearance fumigate at once. Usually this pest makes its appearance just after the flowers are set.

EARLY VINES.—Commence thinning bunches as soon as the berries are of a suitable size, which will be the case a few days after they are set. It is a mistake to leave them until nearly as large as peas, for as soon as thinned the berries swell rapidly. A few points to be observed are, use good, clean, and sharp scissors, and do not allow the points to prick any of the berries. Do not touch the berries with the hand or hair. Commence shaping your bunch from the bottom, leaving one berry at the point. When thinning is completed give a liberal dressing of some approved fertiliser. Water this in with water at a temperature of about 80 degrees; the border may then be mulched as recommended for peaches.

STRAWBERRIES.—Plants ripening their fruits should not have manure after showing colour, and when the fruits are nearly ripe remove to a cooler and more airy house to ensure the full development of the flavour. Succession batches should have the fruit supported with small wire frames, which can be obtained from nurserymen or sundriesmen. These answer well, and last for years if taken care of.

MELONS.—In the case of melons in houses train the growths up short stakes till they reach the wire trellis, and do not bruise the leaves or stems, as it is often from this cause that gumming or canker makes its appearance. Continue to train the main stem up the trellis, and stop when the top is reached. When the side or lateral growths have developed female flowers these should be pollinated. This operation should be effected in the middle of the day, when the pollen is dry. It is best to pollinate about four fruits on each plant at the same time, and if one fruit obtains a great start it should be taken away.

FIGS.—These are now growing rapidly, and when the new shoots are about a foot long the points should be taken out in order to divert the energy to the fruit. Tie in new growths where required for extension purposes. See that plants growing in pots do not suffer from an insufficiency of liquid nourishment, because of the risk of the premature falling of the fruit. Syringe the foliage twice daily in fine weather.—W. A. Cook, Leonardslee Gardens, Horsham, Sussex.

THE KITCHEN GARDEN.

ASPARAGUS.—If the permanent beds of asparagus are not in a satisfactory condition, and it is necessary to make new beds, do not delay in carrying out the work. Use two-year-old plants, and provide for them thoroughly well-trenched soil that has been enriched with good farmyard manure, wood ashes, etc. Asparagus is very impatient of stagnant moisture, therefore if the soil is at all stiff or retentive add coarse sand accordingly, and keep the beds high. For good strong produce it is advisable to plant in rows from 2 feet 6 inches to 3 feet apart and to allow about 18 inches from plant to plant in the row. In planting carefully spread out the roots, and do not allow them to become dry during the process. It is a good plan to have a young colony of home-grown plants on hand by sowing a little seed each year.

CELERY.—The main sowing of celery should now be made in boxes in rich soil. Sow the seed somewhat thinly, and place in a temperature of between 50 and 55 degrees. Cover the boxes till the seed germinates, after which bring the young plants along sturdily by placing them near the glass in a cool frame, where they should remain until they are large enough for pricking out into prepared beds. Wright's Grove Pink and Red have been excellent in standing the winter here, and I recommend them to be included in every collection.

VEGETABLE MARROWS.—Sow now in 60's, two seeds in each pot, and assist with a little heat till the young plants have formed their first rough leaves. Afterwards gradually harden them by removal to a cool frame. These plants will be suitable for transferring at the end of May to their permanent beds. The protection of handlights may then be needful to avoid a check to growth till the weather is genial enough for full exposure.

SPINACH.—To follow the winter crop fresh sowings will now need to be made. Select a warm border and sweetened soil, and add a light dressing of soot and lime to its surface. Sow in drills at 15 inches apart. Thin the young plants early before they become drawn or weakly, and apply periodically a light dressing of fine nitrate of soda to encourage a vigorous growth.

SPINACH BEET.—Also make a sowing of the seeds of spinach beet. This crop is not particularly fastidious as to soil or situation, and will succeed in positions not particularly favourable, especially during the summer months.

FRENCH BEANS.—The recently experienced severe weather has seriously damaged outside green crops, hence a scarcity will be experienced. To maintain, as far as possible, the supply of green vegetables, make liberal sowings of French beans in pits and frames in rich soil. Only very mild hot-beds will be necessary after this date to promote a healthy and active root action.

HERBS.—Herbs are continually in request, and the present season is a good one for examining the stock plants and dividing and replanting them according to their condition. For convenience it is a good plan to have a bed of each kind of a size likely to meet the demand. Seeds may also be sown of the hardier kinds, such as thyme, sage, chervil, tarragon, leaving the tenderer sorts, as the basils, etc., a week or two yet before sowing them.

GENERAL REMARKS.—Large plantations of potatoes will soon have to be made. Therefore, the important matter of having the seed in proper condition should not be overlooked. Expose the tubers to light in a cool place, and remove the weakest shoots, leaving three shoots only, and these the strongest. Neglect of this is often the result of a large percentage of small and comparatively useless potatoes. Continue to place warm manure and protecting material round the crowns of rhubarb outside. This method now will be the most economical and efficient means of forcing rhubarb. The above also applies to seakale. By placing ashes about 10 to 12 inches deep over a quantity of crowns under some pots, good strong produce may be obtained in succession to the manure-forced crop. Also continue to make small and frequent sowings of the various salad plants, and prick off young lettuce from earlier batches under frames for planting out later.—Charles Flack, Cholmondeley Castle Gardens.

BULB CULTURE.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

SWEET PEA JOTTINGS.

The subject of supports for sweet peas is one of more than passing interest to the great body of sweet pea lovers. It may not greatly concern the large growers, especially if they are located well out in the country, and even if they are near towns, they can easily make suitable contracts for sticks. I am strongly of opinion that the stout wire supports will increase in favour. They are costly to instal, but they last a long time. I hope to make some experiments with the wide-meshed, hurdle-like wire supports this season, for, though I have seen these supports used in several ways, and seen miles of wire netting supporting sweet peas, I have always used sticks exclusively myself.

The number of societies in affiliation with the National Sweet Pea Society steadily increases. There are now seventy-three such societies, and I am sure there would be many more if members of the society used their efforts and influence whenever possible. The chief points are that the local society pays an annual subscription of 10s. 6d. In return for this modest sum it receives one silver medal, to be offered in an amateur, or at least a trade-excluded, class; a copy of the "Sweet Pea Annual and Schedule," and the opportunity of representation at the general meeting of the parent society. It is expected that affiliated societies will adhere to the list of too-much-alike varieties at their own shows, and also maintain the society's standard of colour classification. The honour of winning one of the society's medals appears to be very greatly appreciated.

In the official catalogue of sweet peas quite the right thing has been done in inserting, after the name of the variety, the name of the raiser or distributer, or, where these are not one and the same, placing the two names within the brackets. In this way the name of the raiser is recorded, and he receives some credit for his work. In many classes of florists' flowers it is now practically impossible to find out who were the raisers of even very popular varieties, and though the variety is neither better or worse for this lack of knowledge, the information would add interest for the raiser, the grower, and the scribe.

In a letter received recently from Mr. T. [illegible] Dignall, he raises the question of synonymy, and suggests that efforts should be made this summer to determine which varieties are identical with certain others. This is a good point, and, with the lists of too-much-alike varieties at hand the work, if possible, should not be difficult. Anyway, it would serve a useful purpose if every grower sent in lists of what he or she considered synonymous varieties in the various show classes.

Just how many varieties of sweet peas I shall grow this season it is difficult to say at present. Forty-eight has hitherto been the limit, but with rather more space at disposal that limit is certain to be exceeded. Sweet peas are very seductive, even in the advertisement stage, and one needs great strength of will to resist the temptation to secure "just one or two more." Then there are one's friends, who have more than enough of seeds of certain varieties, and they offer their surplus in exchange for any varieties you possess and they have not. This is a subtle temptation, because the chances are you accept varieties not already sown, and so the list increases. A competitor who has a small garden is safe from these blandishments; he dare not crowd his plants and rows, and he cannot afford to experiment too freely on the newer varieties.

The National Sweet Pea Society has to suffer a little for its success, just as individuals do. Some want the committee to go faster; others consider the pace too hot already. But there always will be people who "are never happy unless they are miserable"; people who raise bogies for the pleasure of knocking them down again. There are many things the society might do if it had more funds at disposal. At present it gives more for a 5s. subscription than any other society I know, and I know and belong to a good many societies. From most of these I receive a one-shilling admission ticket—that is all. From the N.S.P.S. I receive:

	s.	d.
"Sweet Pea Annual" (2s. post free), say =	1	9
Admission ticket to London show ... =	2	6
Admission ticket to Saltaire show ... =	1	0
	5	3

Besides these there are other receipts that have no defined cash value, but are of no small worth, and they include the right to compete free in certain classes at London and Saltaire; admission to inspect the society's trials at Reading University College; and the schedule, which contains the classification lists. Further, membership gives me the opportunity, if not the right, of worrying the hon. secretary as much as I please; of slanging the General Committee; and of abusing the trials and Floral Committee—all for 5s. And yet those who "take" these opportunities are mostly non-members! Thank goodness Mr. C. Foster and I are not thin-skinned, and the General and Floral Committees are well able to look after themselves and their own business. Moreover, one hundred and thirty new members since the list was closed for the 1909 "Annual," is not exactly discouraging.

Chas. H. Curtis.

Sweet Peas and Frost.

The recent severe frost gave growers an anxious time. Observations over a number of years on the effects of frost on sweet pea plants started in slight heat, and transferred to a cool greenhouse, show that they are extremely hardy. My plants on two successive nights were subjected to about 20 degrees of frost without any extra covering. Each morning they were drooping, and looking very unhappy. I sprayed them with ice cold water, and within an hour they were "up and at it" again. This holds good with all the varieties except the scarlet and orange shades. In such weather they should be transferred to a little warmth again.

Last year, when we had similar frosts late in April, and the pots were outside, the two colours named suffered severely, their leaves were blanched, and they never recovered from the shock. Among some pots of F1 seedlings (the second year from the cross) some plants were damaged, and they proved to be of these shades. The curious thing is that the others from the same cross and in the same pots were unharmed. It is wise, therefore, to give these tender ones the warmest position in the cold greenhouse, and to plant them out a fortnight later than the others.

A cold wind blasts the young plants when planted out even more than severe frost that comes when the air is still. Plants put out early should have wind protectors. For circles I use portions of old sacks, 18 inches deep, tacked on to three two-feet stakes, and forming a semicircle. These are easily knocked in when wind comes, and removed in good weather. Longer material is necessary for rows. Plants in pots should be examined regularly now, and the growths tied loosely, but securely, to the stakes. When transferred to their permanent quarters this trouble is well repaid, as otherwise they are apt to be broken and nearly twisted out of the ground in windy weather. As each station or row is planted remember to run black thread across the tops and centre of the plants to prevent birds doing damage.

Duns. A. Malcolm.

The Horticultural Club.

SOIL INOCULATION.

The usual monthly dinner of this club was held on Tuesday, the 9th instant, at the Hotel Windsor, under the chairmanship of Mr. Harry J. Veitch, V.M.H., a very full attendance of members and guests being present to hear a discussion on the above subject between Professor Bottomley and Mr. F. J. Chittenden with reference to the recent experiments conducted by the latter with nitro-bacterine at Wisley. It will be remembered that, as a result of those experiments, Mr. Chittenden came to the conclusion, on the basis of very carefully prepared and tabulated data, that for ordinary garden soil the bacteria introduced by Professor Bottomley's cultures produced practically no advantageous results. Since, however, these Wisley experiments had embraced, in addition to the inoculation, the application of varied manures to many of the plots concerned, Professor Bottomley claimed that this fact vitiated in many cases the value of the results, some of the manures being admittedly inimical to the bacteria concerned; and he furthermore considered that certain deductions from the data arrived at were not quite just. The happy thought was then conceived of bringing these two gentlemen together on this occasion, and thus affording an opportunity of ventilating the question not merely between themselves, but in the presence of a number of gentlemen keenly interested in the matter, and, many of them, capable of throwing side lights upon it by independent experiments.

Professor Bottomley opened the discussion by repeating the argument already published anent the injurious effects of some of the manures, and he also, by means of tables roughly prepared and displayed in chart form, re-analysed a number of Mr. Chittenden's figures to show that the unfavourable results were largely due to tabulation on, what he submitted, were unfair lines, the actual results, from his standpoint, showing material advantages due to inoculation under the Wisley conditions, though he contended that those conditions were absolutely not such as permitted of a fair trial at all; the regeneration of poor and uncultivated land, and not the treatment of already fertile soil, forming the main field for the inoculation operations which he advocated. This address, which was admirably lucid and characterised, as was indeed the whole discussion, by the utmost good humour and mutual appreciation, created the most favourable impression.

Mr. Chittenden, on the other side, then rose, and, although he disclaimed the gift of eloquence such as that which had just been heard, he was no whit behind his friendly adversary in the power of summing up the per contras and giving adequate reasons for the course he had pursued in mapping out the trials at Wisley, and tabulating the results, and it was abundantly obvious that every step he had taken has been the outcome of ripe and careful provision. In conclusion, after dealing with Professor Bottomley's argument and objections, he sat down with the distinct and unqualified assertion that it was his opinion still that soil inoculation was of no service whatever in ordinary garden soils.

Professor Keeble, of Reading, then rose, and, in an admirable but brief address, expressed the opinion that the value of inoculation for sterile soils, such as Professor Bottomley had in view, had not been in any way negatived by the Wisley trials. The real fact was that the study was a new one, and that the discrepancies in results were mainly due to ignorance of other factors affecting the question. It had been noted, for instance, that inoculation had a remarkable effect in modifying the root system, transforming deep tap-root systems into ramifying fibrous ones, a fact which brought the nature of the soil, friable or otherwise, into question, entirely independently of manurial admixture, a fact which would also account for many puzzling differences in results obtained under apparently identical conditions.

Messrs. A. Sutton, C. E. Pearson, Walker, G. L. Paul, R. Barr, and Voss, also took part in the discussion, the final results being, as Mr. Harry Veitch put it, a practical draw, a draw, however, which he hoped would be succeeded later on by another discussion, when fresh facts had been obtained, and the points now in dispute had become clearer.

A very hearty vote of thanks was accorded to Professor Bottomley and Mr. Chittenden, and also to Professor Keeble.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, MARCH 9.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Rev. W. Wilks, Dr. F. Keeble, Messrs. C. T. Druery, A. Worsley, W. Hales, J. Arkwright, L. Crawshay, J. Douglas, H. J. Chapman, G. Massee, A. W Hill, H. T. Güssow, G. S. Saunders, A. W. Sutton, E. M. Holmes, J. T. Bennett-Poë, J. Fraser, R. Hooper Pearson, H. J. Veitch, and F. J. Chittenden (hon. secretary).

BEETLE IN STEM OF VANDA TERES.—Mr. G. S. Saunders reported that he had examined the stem of Vanda teres sent to a recent meeting of the committee, and found that the beetle boring into it was a species of xyleborus, not a native, nor so far as could be ascertained recorded as occurring in Europe up to this time. The plants attacked were sent by Mr. Rogers from a greenhouse at Bury, Lancs.

SPOTS ON LEAVES OF LAPAGERIA.—Mr. Massee reported that he had examined the leaves of lapageria shown at the last meeting, and found that the roundish brown spots upon them had been caused, not by a fungus but by drip.

CINERARIA SP. (?).—Mr. A. W. Sutton showed a plant of cineraria for naming, but it did not appear to agree exactly with any described species, though in many points it resembled Cineraria Heretieri.

"VEGETABLE" ASBESTOS.—Mr. Holmes reported that he had examined this material, sent to the last meeting, and could find no trace of vegetable structure in it. The substance was creamy-white in colour, and was lamellated, fairly soft to the touch, and resisted fire. Chemical analysis showed it to contain alumina in large quantities, magnesium, calcium, and smaller quantities of sodium and silica. Mr. Holmes considered that the analysis pointed to this being of mineral origin, and not of having been derived from "a cactus from China," as the sender had suggested. It appeared to be nearly allied to the substance known as "mountain leather."

BULB ON INFLORESCENCE.—Mr. Worsley showed an inflorescence of Lachenalia tricolor, having a small bulb occupying the position of a terminal bud on the inflorescence.

ABERRANT ORCHID.—From Mr. G. W. Miller, of Wisbech, came a specimen of Cypripedium Pitcherianum, Williams' var., with a well-formed double lip.

FASCIATION IN EUONYMUS JAPONICUS.—Mr. J. Fraser showed fasciated branches of Euonymus japonicus. The fasciation had followed after severe cutting back of the stem. Numerous buds had started in growth from near where the cut had been made, and among them some had produced fasciated shoots.

MALFORMATION IN TULIP.—Rev. J. Jacob sent a flower of tulip, having on the mid-rib of one of the perianth pieces on the outer side, two small horn-like growths. The structure was similar in character to those seen in crested flowers, and was apparently the commencement of a crested growth.

East Anglian Horticultural Club.

Mr. T. G. Bishop has on several occasions given information to the members of this club, hence it was natural that a large number of members turned up at the March meeting, whereat he was announced to give a paper upon "Hardy Climbers and Their Uses." The way that these subjects adorned old buildings, old tree stumps, arches, etc., was well known to every gardener, but yet they were not used to the extent they ought to be. Undoubtedly the most popular at the present time was the Ampelopsis family, its freedom of growth, grace, and beauty of colour being so much in its favour. Next in point of popularity came the ivies. Then the essayist went through the whole range of suitable subjects. The paper was "leavened" with little anecdotes and episodes, to great advantage.

Mr. J. Powley (president) opened the discussion, and was followed by Messrs. J. Forder, L. Smith, C. H. Fox, R. Watson, E. Peake, H. Perry, C. Burtenshaw, C. Hines, E. Goldspink, and others. Mr. L. Smith reported on his visit to the Ipswich Gardeners' Association, when a good assemblage turned up to hear his paper upon "Orchid Culture." The exhibition tables contained some choice fruit exhibits; Cox's Orange Pippin apple was staged in grand form by two or three exhibitors, while Annie Elizabeth dominated the culinary apple section. Mr. C. Burtenshaw had a splendid dish of Uvedale St. Germain, which gained him first place in a strong class for pears. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, had a well-grown cattleya in the orchid class, and a beautiful bunch of dendrobiums, cyclamens, and begonias in the flower class. Mr. W. Laws, gardener to G. E. White, Esq., Eaton, staged some grand winter-flowering carnations, which brought him a first in the cut flower section. Plants were good, and beet and rhubarb were well shown in the vegetable section.

Bristol Gardeners' Association.

The Bristol Amateur Gardeners' Association paid their annual visit to the above association on Thursday, March 11, at St. John's Parish Rooms, and Mr. S. Shaddick presided over a good attendance. In the absence of Mr. White, of the Amateurs', through bereavement, Mr. Scott, of Downside Gardens, kindly filled the breach, and gave a practical paper upon "Border Carnations." At the outset Mr. Scott deprecated the way in which flowers are mutilated and dressed with paper collars on the show board, and he recommended the more natural and artistic way of staging them in vases as being a decided improvement on the old method. The lecturer gave full cultural details, and said July was the best month for layering, and autumn the best time for planting. Wood ashes mixed with the soil proved very beneficial; he advised firm planting, and said the bed ought not to be in the same place two consecutive years. Planting in masses gives much the best effect.

The Chairman, Messrs. Holt, Curtis, Garnish, Morse, House, and Wakefield took part in the discussion, after which a hearty vote of thanks to Mr. Scott ended the meeting. An ordinary certificate was awarded to Mr. House, jun., for a nice pot of Iris reticulata.

Birmingham Gardeners' Association.

An instructive paper was read on Monday evening, the 8th inst., by Mr. Robert Usher, gardener to J. A. Kenrick, Esq., Harborne House, Harborne, the subject being the "Culture of Cœlogyne cristata." Mr. T. Humphreys occupied the chair. This being Mr. Usher's initial attempt at lecturing before the members of the society (of which he is a member of committee), considerable interest was created among the members anticipatory to the meeting. This interest was fully justified by the able manner in which Mr. Usher acquitted himself in giving a concise and practical exposition on the culture of that useful and charming winter-flowering orchid, Cœlogyne cristata. In the compost employed Mr. Usher favours osmunda fibre in preference to polypodium fibre as one of the constituents. He also prefers the earthen pans or pots without side holes, as these afford a ready harbour for beetles, etc. In support of his method of culture the lecturer exhibited well-grown specimens of Cœlogyne cristata Chatsworth var. measuring upwards of two feet in diameter, and profusely covered with finely developed flowers. This evoked the encomiums of several experts present, and a cultural certificate was worthily accorded.

In the animated discussion that followed, a member, in referring to osmunda fibre, said he found that it developed the mycelia of fungus, but after the first application of water the mycelia disappeared. Another speaker remarked that a most successful grower preferred blocks of wood instead of pans or baskets, as when so grown they formed most suitable objects for dinner table or other room decoration. Blocks of [illegible] denuded of bark were said to be excellent, and, of course, artificial drainage was not required, but the ordinary compost was used in a more fibrous state than for pan culture and copper or other suitable wire was used in securing the material and pseudo-bulbs to the blocks of wood.

At the same meeting the chairman announced that the application for permission to visit Chatsworth on the occasion of the summer "outing" had been granted, and the vice-secretary was instructed to record the permission in the minute book.

Reading Gardeners' Association.

A most interesting and entertaining [illegible] ture was given in connection with the above society on Monday, March 8, in the Abbey Hall, Reading, by Mr. W. F. Giles, [illegible] Messrs. Sutton and Sons, the subject [illegible] "Vegetables, Old and New." The lec[illegible] was illustrated by a collection of about [illegible] lantern slides.

Mr. A. F. Bailey (chairman) presided, and there was an exceptionally large attendance of members.

Mr. Giles opened his remarks by tracing the antiquity of some vegetables which still find favour in our own time, reminding his hearers that the Israelites, in their wanderings, murmured at being deprived of the leeks and onions which they had enjoyed during their sojourn in Egypt. Records [illegible] cerning radishes, too, are to be found depicted on the Pyramids. Pliny also was an authority on the vegetables used by the ill-fated inhabitants of Pompeii. The [illegible] turer then drew attention to the fact [illegible] if in science, arts, and commerce we [illegible] advanced by leaps and bounds, it was [illegible] the case with regard to the produ[illegible] new and improved vegetables.

To give force to his remarks Mr. [illegible] threw upon the screen some pictures [illegible] from "Gerard's Herbal," published in [illegible] showing the type of vegetables in vogue [illegible] the days of "Good Queen Bess," and [illegible] by way of contrast, illustrating some [illegible] magnificent varieties of peas, beans, [illegible] cabbages, celery, carrots, onions, [illegible] leeks, melons, tomatoes, turnips, etc. [illegible] out by the leading seed merchants [illegible] present day

Mr. Giles then explained to his audience what immense pains are taken in selection, re-selection, crossing, and re-crossing, in order to obtain new, and retain the vigour of older varieties of vegetables, and drawing attention to what had been done with garden peas in particular, since Thomas Andrew Knight, afterwards president of the Royal Horticultural Society, made the first recorded cross with peas in 1787.

At the conclusion of his lecture Mr. Giles was warmly applauded, and at the close of the meeting was accorded a hearty vote of thanks. Mr. Charles Foster, Assistant Director in Horticulture, University College, Reading, exhibited a splendid collection of forced vegetables, including asparagus, lettuces, radishes, rhubarb, seakale, etc., which evoked much admiration.

Several new members were elected.

British Gardeners' Association.

LONDON BRANCH.

The monthly meeting took place at Carr's Restaurant, Strand, on Thursday, March 11, at which the chairman of the association presided. The epidemic of influenza was largely responsible for the small attendance, only 32 members being present. At question time, the vexed question which has occupied the minds of many of our leading scientists was put to the meeting: "What is the cause of variegation in plants?" Messrs. Cowley, Barnes, Hartless, and Summerfield gave some interesting points, which were followed by some practical remarks by the Chairman. The business part of the meeting was followed by a lecture on "Insect Pests." Unfortunately the lecturer, Mr. A. E. Hamling, was unable to attend, but he kindly forwarded his paper, which was read by Mr. E. F. Hawes. The paper dealt with the different orders the insects mentioned belonged to, and the rapidity with which many classes of insects increased. The goat moth, cabbage moth, onion, beet, turnip, and crane flies, wireworms, and surface caterpillars were some of the principal kinds dealt with. Mr. Hill and Mr. Prince opened the discussion, and enlarged upon the remedies to be used. At the conclusion a very hearty vote of thanks was accorded to Mr. Hamling for his valuable paper; to Messrs. Pets and Co., for sending large diagrams of insects; and to Mr. Hawes for presiding.

FORTHCOMING ENGAGEMENTS.

TUESDAY, March 23.—Royal Horticultural Society, Meeting of Fruit, Floral, and Orchid Committees at noon; General Meeting at 3 p.m. Lecture by Mr. R. Lloyd Praeger, on "Rock Gardens"; Scientific Committee at 4 p.m.

National Rose Society, Meeting of General Committee, at Westminster Palace Hotel, 3 p.m.

WEDNESDAY, March 24.—Royal Society of Arts, Meeting at 8 p.m.

Croydon Gardeners' Association will hold its usual exhibition of spring flowers on Wednesday, May 5, and it is anticipated that it will be not less successful than in previous years. We mention this event because of the unique manner in which it is carried out. Instead of offering prizes and making a charge for admission, the society engages a suitable hall, the members contribute freely of their best, and the public are admitted free. We admire the public spirit of the society and its members, but we are not sure whether the provision of free entertainment for those who can well afford to pay is quite wise. There may be local considerations of which we have no knowledge, and it may be that there are collecting boxes for one of the gardening charities to which the visitors contribute liberally as an expression of their appreciation of the display provided.

DESTRUCTION OF VERMIN.—Most gardens are pestered with Rats and Mice. Every effort should be made at this time of the year to exterminate them before seeds are sown. Danysz Virus is first rate stuff for killing these vermin. Single tube, 2s.; three tubes, 5s. Post free from DANYSZ VIRUS, LTD., 52, Leadenhall Street, Garden Dept., London, E.C.—[Advt.]

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

SYNONYMOUS TEA AND NOISETTE ROSES.—F. E., Chertsey: For exhibition purposes it is not permissible to show both Souv. de S. A. Prince and The Queen in the same stand; and only one of the following four may be staged in any class for distinct varieties: Alba rosea, Josephine Malton, Madame Bravy, and Madame de Sertol.

DISEASED CHRYSANTHEMUMS.—Last autumn several correspondents sent stems and leaves of chrysanthemums that had become browned and shrivelled, and appeared to be suffering from some malignant disease. We sent several specimens to Mr. G. Massee, who undertook to examine them. He now informs us that there was no real disease present, and he succeeded in raising a young plant with perfectly healthy leaves from this apparently hopeless material. There were fungus spores present in the specimens, but these were not the cause of the damage, but were present as a result of the decay. Mr. Massee believes the shrivelling to be the outward and visible sign of some physiological disorder, and suggests over feeding as the probable cause.

RED-STEMMED ROSE.—S. E. W., Tonbridge: We feel sure the rose you mean is Rosa ferruginea, or, as it is often called, R. rubrifolia. It is an European species, of fairly strong growth, furnished with hooked prickles, and ovate, glaucous, red-tinted leaves. The stems are red or purple, the flowers are deep red, and the fruits purplish-red. The growths of this rose are frequently and most effectively used in floral decorations where rose blooms are freely used.

"BOTANICAL MAGAZINE."—J. A. A., Didcot: The "Botanical Magazine" was commenced in 1786, by Wm. Curtis, and the introduction to the first volume is dated from the Botanic Gardens, Lambeth, March, 1787. The book has been issued continuously ever since, and in recent times has been edited by successive directors of the Royal Gardens, Kew. There are now one hundred and thirty-five volumes, and a complete set is worth a great deal of money—indeed, is very hard to obtain. In its present style the monthly parts usually contain five coloured plates, and each part costs 3s. 6d.; if plain illustrations are desired, the parts may be obtained for 2s. 6d. each. The publishers are L. Reeve and Co., Henrietta Street, Covent Garden. The work is an excellent one, but is of little use to amateurs with small gardens; its great value lies in its portraits and descriptions of new and rare plants, and thus botanists, journalists, and cultivators of rare species are those who purchase it.

MANURES.—J. A., Newtown: Both the manures you mention are excellent; the first is more suitable for use in the garden, for crops of vegetables, etc., whereas the second is highly concentrated, and, therefore, more readily adapted for use under glass or for any garden crop that is being made a speciality. Send for particulars in each case; you will find the names and addresses in our advertising columns. We cannot undertake to answer queries by post, though if the matter is very urgent we sometimes relax this rule.

LIVER OF SULPHUR.—J. H., Wansford: The chemist's name for the popular liver of sulphur is sulphide of potassium. If you cannot get what you want from the chemist send to one of the horticultural sundriesmen who advertise in our columns, and you will receive the proper material in the course of a post or two. We have found it difficult sometimes to deal with the ordinary chemist in materials used in horticulture because the prices are very high, and there is, not infrequently, an endeavour to sell something else "that will do as well," and there is an implied suggestion that the gardener customer does not really know what he wants; we therefore recommend the horticultural sundriesman. We certainly should not recommend liver of sulphur if we thought it injurious; it must be used in accordance with directions, and, of course, should not be used when fruits are approaching ripeness, especially when the fruits are downy, as in the case of peaches. Nitrate of soda is a very quick acting nitrogenous manure, and is not used as an insecticide.

PRIMULA KEWENSIS.—D. C., Salop: Primula Kewensis is not "dried off" after flowering, but it will require less root moisture after flowering than during that period, and when growing robustly. You will find the plants making several crowns or leaf-rosettes, and it will be possible before long to separate these one from another by means of a sharp knife, and if the work is carefully done each crown will have a few roots attached. These should be potted up separately and kept rather close in a warm greenhouse for a few weeks until new roots have formed, when cooler conditions will be necessary, and a cold frame will afford the needful shelter. You may retain the old plants, unperturbed, if you prefer it, but in such case shake away a good deal of the old soil, put the plants in pots that will just comfortably hold them, eventually giving them a good shift, and using fairly rich soil. Primula verticillata, which is one parent of P. Kewensis, requires pretty much the same treatment, but should not be watered overhead.

OSTROWSKYA MAGNIFICA.—J. A., Didcot: We do not understand the omission to which you refer; it must have been an oversight. Ostrowskya magnifica comes from the higher uplands of Eastern Bokhara, and is quite hardy. Some protection from strong winds is desirable, and a covering of ashes or light sandy soil over the plant during winter serves to keep the large tuberous roots quite safe. Though loving a deep soil, this giant bell-flower should have a well-drained position. Great care should be exercised in planting, as the large fleshy roots are very brittle, and it is the easiest possible thing to break, and otherwise damage them. Take out a large hole, sufficiently deep and wide to amply accommodate the plant, put the latter into position, and then fill in the soil. Any attempt to force the plant into a hole or position will end in failure. It is a quite easy matter to raise ostrowskias from seed, but seedlings do not come into bloom until the third or fourth year. If you add a good proportion of sand to your soil, and some leaf-mould also, you should be able to grow Ostrowskia magnifica well. Plants may be purchased from any of the hardy plant specialists who advertise in our columns.

NAMES OF PLANTS.

M. R. A., Weymouth.—1, Primula rosea; 2, Adonis amurensis; 3, Camellia reticulata.

D. H., Abingdon.—1, Sarracenia flava; 2, Phalænopsis Schilleriana; 3, Odontoglossum Adrianæ; 4, Cochlioda vulcanica.

E. J., Cirencester.—1, Nothoclæna sinuata; 2, Asplenium Richardsoni; 3, Santolina incana; 4, Bryophyllum calycinum.

NAMES OF FRUITS.

We have received several fruits for name during the week, but as they are rather difficult to determine at this season we are holding them over for further opinion.

TRADE NOTES.

From the Native Guano Company, Bridge Street, Blackfriars, E.C., we have received a book of over one hundred pages, chiefly devoted to testimonials showing the great advantages to be derived from the use of Native Guano on farm and garden crops. These testimonials are from all parts of the United Kingdom, proving that in the cool north, the warm south, and the moist west, the manure is alike efficaceous. Directions are given for the use of Native Guano, and these we should like to see extended and particularised in a future issue, with a view of showing the wider use to which the guano can be put.

As so well known to our readers, Mr. C. E. West, of Higham Hill, N.E., has devoted much of his time to the invention of labels suitable for ornamental plants, fruit trees, etc., and has been successful in introducing several forms not less remarkable for their usefulness than for the ingenuity they represent. Within the past few days we have received specimens of labels which are a considerable advance upon those previously manufactured, and should prove of much value. These are known as the "Alu" label, and are manufactured in white metal, somewhat resembling aluminium, and have a smooth surface, which can be readily written upon with a lead pencil, which Mr. West states is indelible. The plain labels are provided with a shank, by which they can be inserted in the ground or suspended to the branches of a tree. The fancy shapes can be attached to the branch of a plant or tree by means of narrow wing-like strips of metal at the top, or by a wire passing through a hole at the bottom. The labels are inexpensive, and we suggest that samples, with prices, be obtained.

CATALOGUES RECEIVED.

JAS. CARTER AND CO., HIGH HOLBORN. — A very useful catalogue of farm seeds, containing much interesting information relating to grasses.

HARRISON AND SONS, MARKET PLACE, LEICESTER.—An admirably printed, freely illustrated, and otherwise excellent catalogue of farm seeds.

AMOS PERRY, ENFIELD, MIDDLESEX. — Mr. Perry has now issued his "First" catalogue of hardy ferns, and it is a most interesting one, including about three hundred varieties, a considerable number of which are illustrated.

NEW SPRAYING MACHINES.

The importance of judicious spraying as an essential in the successful cultivation of hardy fruits is now recognised by the general body of growers, and the question to which they now give close attention is not whether spraying is desirable or not, but which of the machines on the market is likely to be the best adapted to their requirements. We have recently had our attention drawn to some spraying machines that have been introduced by the Four Oaks Undentable Syringe and Spraying Machine Company, Sutton Coldfield, Birmingham, that have the promise of possessing a high degree of usefulness. These include the Four Oaks Knapsack Sprayer, in which lightness and strength are admirably combined. The special features claimed for this machine are the absence of rubber valves, which, in some cases, occasion considerable trouble, the force by which the spray is delivered, and the design of the nozzles, which ensures a spray of remarkable fineness. The firm manufactures a considerable number of other spraying and lime-washing machines in different designs, and of these brief reference must be made to the Westwick Park Spraying Machine, which is intended for larger work than the knapsack sprayer, and is mounted on two wheels, and can be moved about by a horse or by hand. This machine is fitted with two delivery pipes, and capable of spraying a considerable area in a comparatively short time. In some gardens a well-made syringe fitted with a suitable nozzle will be equal to the spraying that will be necessary, and in some others of large dimensions a syringe fitted with a spraying nozzle will be found a valuable adjunct to the larger machines. It is therefore of some practical importance that the Four Oaks Company should, by the provision of suitable nozzles, have rendered their popular syringes no less useful for spraying than for the ordinary work of such implements, the patent syringe manufactured by this firm is provided with a corrugated or fluted covering, which protects the inner working barrel from indentation, and gives a firm hand grip. The form for ordinary use may, if so desired, be fitted with an angle joint, which greatly facilitates the syringing of the underside of the leaves.

NEW BOOKS.

◆

THE ENCYCLOPÆDIA OF GARDENING. By T. W. Sanders, F.L.S. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Price, 3s. 6d.; post free, 3s. 10d.

When a book has passed through twelve editions, each numbering many thousands of copies, it may be safely assumed that it has become so well known as to render lengthened description of its features unnecessary. Therefore, in referring to the thirteenth edition, which is now before us, we need do but little more than congratulate the author on the success he has achieved in the production of a book that has proved so admirably adapted to the requirements of all who take an active interest in the gardening art, and direct attention to the improvements that have been effected. The exceptional success of the work is no doubt due to the fact that it contains in a concise form what a man who takes an interest in his garden, and has but little spare time, wishes to know about the cultivation of the various classes of hardy, half-hardy, and tender plants, that have a place in gardens. It matters not what may be the tree or shrub, the hardy annual or perennial, the rock or water plant, the greenhouse or stove plant, the orchid or palm, or the fruit or vegetable on which information may be desired, it can at once be found. Full and admirably arranged as was the matter in the previous editions, it was decided when the preparation of the thirteenth became necessary, to reset the whole of the book in new type, and to make several improvements thus rendered possible. Chief among other improvements is the breaking up the more solid portions of the text into paragraphs, which greatly facilitates reference; the addition of lists of species belonging to each genera, with their height, colour, duration, period of flowering, etc.; the material increase in the cultural details, more particularly those relating to vegetables and fruits, the revision of the nomenclature, and the inclusion in alphabetical order of all the common names in general use. These and other alterations greatly enhance the value of the book as a work of reference, and should add materially to the high degree of popularity it already enjoys.

"FOUR OAKS" SPRAYING MACHINE, "WESTWICK PARK" PATTERN.

GARDENERS HAVE PROVED

"Kilogrub"

DESTROYS INSECT PESTS.

The great difficulty in successful horticulture is not how to rear fine plants, but how to prevent their destruction by insect pests which ruin root, leaf, and flower. Gardeners all over the country are finding that the new scientific preparation "KILOGRUB" effectively exterminates wireworms, grubs, woodlice, slugs, beetles, and all insect pests which do damage to garden produce. The new preparation "KILOGRUB" has been tested under every possible condition of horticulture, and has been proved to do all that is claimed for it without damaging plants.

2 or 3ozs. of "KILOGRUB" worked into each square yard of soil will render it immune from garden pests. "KILOGRUB" does not lose its efficiency at once, retaining its strength for as long as six months.

As it is the fumes given off and not the powder, which destroys insect life, "KILOGRUB" not only kills ground insects, but those which attack the crown of the plant.

Trial tin will be sent to any gardener, postage paid on receipt of 9d. Larger quantities can be obtained at the following prices, cash with order, carriage paid:—

7 lbs. ...	2s. 0d	½ cwt. ...	7s. 0d.
¼ cwt. ...	5s. 0d.	1 cwt. ...	11s. 6d.

Write us for Free Booklet, telling the story of this wonderful help to successful gardening.

BULL'S WORLD-RENOWNED ORCHIDS, Import and Export. Catalogue on application.

WILLIAM BULL AND SONS, Warrant Holders to HIS MAJESTY THE KING, King's Road, Chelsea, London, S.W.

WEBBS' NEW SURPRISE PEA
A fine early dwarf Marrowfat variety, 2s. per pint; 3s. 6d. per quart. Mr. J. Murby, head gardener to Mrs. Cazenove, writes: "The best early Pea I have grown is Webbs' New Surprise, which grows from 15 to 18 inches high. For a pea of this height it cannot, in my opinion, be beaten for cropping. The pods are large and filled with peas of excellent flavour."

WEBBS' NEW EXHIBITION RUNNER BEAN.—The finest in cultivation, 2s. per pint; 3s. 6d. per quart. Mr. J. Radley, Gainsborough, writes: "Your New Runner Bean is an immense cropper of delicious flavour. I had pods from 12 to 15 inches long."

WEBB and SONS, The King's Seedsmen, WORDSLEY, STOURBRIDGE.

LAXTON'S FRUIT TREES and STRAWBERRIES.—Thousands of beautifully-trained trees to select from in all shapes. Fully illustrated Catalogue post free. LAXTON BROTHERS, Fruit Specialists, Bedford.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page iii.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

FOREMAN (Inside), age 26; 12 years' experience; fruit and plants, house and table decoration; good references, including Waddesdon Manor and Worth Park. G. JOHNSON, Stansted Hall Gardens, Stansted, Essex.

GARDENER (Second, Inside and Out).—H. STARKE, Gardener to C. Butier, Esq., [illegible] House, Shrivenham, Berks., can confidently recommend W. JENNELL, who has been with him [illegible] years as above; strong and willing; age [illegible] years in previous place.

GARDENER (Second, Inside and Out), nine years' experience; good references; age 25. Berks or counties joining preferred. W. SMITH, The Bothy, Epping House, nr. Hertford, Herts.

GARDENER (Under or Single-handed), or CARETAKER; 14 years' experience [illegible] Outside; good references; married; abstainer. [illegible] The Lodge, West Hatch, Chigwell, Essex.

GARDENER (Under), 20, seeks SITUATION; strong and willing; 4½ years' experience Inside and Out; good reference; free when suited. MURRELL, 50, Hill View Road, Tunbridge Wells.

GARDENER (Working) seeks SITUATION; [illegible] practical experience, Inside and Out; [illegible] age 38; good character. W. SCOTT, [illegible] Dorset.

GARDENER seeks SITUATION on Pleasure Grounds or Kitchen Garden; good [illegible]; age 35; married, two children. E. VINALL, [illegible] Mr. Buckland, Lambs Green, Rusper, Sussex.

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,"
148 & 149, Aldersgate Street, London, E.C

For APRIL 3, 1909.

Please Repeat my Advertisement.

Name.............................

Address.............................

....

Date.............................

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

Situations Wanted—*continued.*

JOURNEYMAN (Third) seeks SITUATION, Inside; four years' experience; age 18; highly recommended; Bothy. E. HENLEY, The Gardens, Saxham Hall, Bury St. Edmunds.

JOURNEYMAN (First, Inside); Fruit and Plant Houses, Table Decorations; age 24; eight years' experience; good references. H. COX, 3 Etterby Terrace, Carlisle.

JOURNEYMAN (Inside and Out). — Mr. HATTO, Walsingham Gardens, Chislehurst, would be pleased to recommend Young Man as above; age 21; seven years' experience; three present situation. Apply, MUMMERY, 190, Widmore Road, Bromley, Kent.

IMPROVER seeks SITUATION in good establishment, Inside; four years' experience; good reference; age 18; Bothy preferred. W. WALLER, Labourne Lane, Hascombe, near Godalming, Surrey.

WANTED, SITUATION as an IMPROVER, age 17; strong and willing; has had three years and ten months' general experience Inside and Out; total abstainer. Bothy preferred. A. HYLAND, Woodlands, Ticehurst, Sussex.

A. CUCKNEY, Fulbeck Hall Gardens, Grantham, can recommend YOUNG MAN for Inside and Out; age 19; Bothy preferred.

ESTATE CARPENTER and HANDYMAN seeks Situation; good joiner, and used to all house repairs, painting, paper-hanging, etc.; 11 years' good character; own tools. W. BARRIER, 17, Lennard Road, Penge.

MARRIED MAN (29), one child, seeks SITUATION as KITCHEN GARDENER, used to cows and poultry; good references; also slight knowledge of greenhouse work; willing and obliging. Apply ARTHUR WILLIAMS, Bisbrooke, Nr. Uppingham, Rutland.

MRS. ANDERDON WESTON wishes to find a place for a STRONG LAD, aged 16, in the gardens, has worked on her farm for 2 years; Bothy preferred. Holme Grange, Wokingham.

SITUATION as ELECTRICIAN; Oil Engine preferred; willing to be generally useful; age 21. G. STRIPP, Shabden, Chipstead, Surrey.

THOS. MORRIS, Gardener, Dytchleys, Brentwood, Essex, would be pleased to recommend ALFRED RAINBIRD, age 18½, Inside and Out; 4½ years' experience. Bothy preferred.

WANTED, SITUATION as HANDYMAN, to work in house or garden, etc.; Reservist; single; abstainer; good references. Apply to ERNEST SCRIVENS, Longborough, Moreton-in-Marsh, Gloucestershire.

YOUNG MAN seeks SITUATION as under Gardener; age 19; Inside and Out; strong and willing. G. LUFF, 18, Prospect Place, Maidstone, Kent.

YOUNG MAN (23), Farmer's Son, seeks SITUATION as UNDER GARDENER, with a good chance for improvement. Good knowledge of kitchen gardening; abstainer; excellent reference. G. SEAR, Hardham, Pulboro, Sussex.

YOUNG MAN seeks SITUATION; assist in garden or odd jobs; age 28, single; 5½ years present place. Apply "P. S.," c.o. Tyrrell, 9, West Street, Crawley, Sussex.

YOUNG MAN seeks SITUATION Pleasure and Kitchen Garden; or single-handed; good characters. London suburbs preferred. A. POTTEN, 3, Western Lane, Balham, S.W.

YOUNG MAN, age 24, seeks SITUATION, Pleasure and Kitchen Gardens, or SINGLE-HANDED; good characters; London suburbs preferred. A. POTTEN, 3, Western Lane, Balham, S.W.

YOUNG MAN (25), seeks SITUATION, either trade or private; 11 years' experience; good references. E. BARNES, 10, Charles Street, Hillingdon Heath, Uxbridge, Middx.

YOUTH, 18, seeks RE-ENGAGEMENT as Third or Fourth, Indoors; or help Out; 4 years outside. Address, Mr. G. FARMER, Head Gardener, Beckford Hall, Tewkesbury.

YOUTH, age 18, seeks SITUATION in good Garden; slight experience; strong and willing; Bothy preferred. H., 138, Silvermere Road, Catford, S.E.

YOUNG MAN (21) seeks SITUATION as GARDENER or IMPROVER; no objection to Nurseries; good references. A. COX, Swerford, Enstone, Oxon.

YOUNG Man, age 23, seeks SITUATION in Nursery; experience in Tomatoes and General Pot Stuff; good reference; abstainer. G. MOCKETT, 6, Vicarage Road, Old Town, Eastbourne.

YOUNG MAN (21), seeks SITUATION in Nursery; Tomatoes, Cucumbers, Strawberries, Chrysanthemums, Bulbs, Bedding Stuffs; 4 years' experience; good references. W. T., 42, Wimborne Road, Southend, Essex.

YOUTH (16), requires SITUATION in kitchen garden and pleasure grounds; can be well recommended; Bothy preferred; strong and willing; 2½ years in present situation. B. JARRATT, Waverly Road, Weybridge, Surrey.

Situations Vacant.

MIDDLESBROUGH EDUCATION COMMITTEE.

LINTHORPE CERTIFIED INDUSTRIAL SCHOOL.

WANTED, a single YOUNG MAN as GARDENER for the above Institution; should be experienced in Inside and Outside work. Preference will be given to one able to instruct the boys in the principles of Horticulture.

The person appointed will be required to take his turn on supervision duty with the other officers. Salary, £40 per annum, with board, lodging, and washing.

Applications stating age, present occupation and experience, together with copies of testimonials to be forwarded to Mr. A. ROBERTSON, Superintendent, Industrial School, Middlesbrough, as early as possible.

MASS OF STENANTHIUM FROM PHOTOS TAKEN AT HIGHLANDS NURSERY.

A New Remarkable Carolina Mountain Plant—

STENANTHIUM ROBUSTUM (Mountain Feather Fleece).

This remarkable hardy perennial is, without doubt, one of our best new introductions, and may be classed with the showiest of all herbaceous plants. As the buds begin to unfold in early August they are quite upright and of a light green tinge, gradually becoming whiter until at last they burst forth into a veritable snowbank of drooping, fleecy bloom of purest white, the panicles often 2 to 3 feet long. In September, the flowers, as they ripen, turn to shades of pink and purple. It is a vigorous perennial, attaining a height of from 5 to 8 feet when well established, and is absolutely hardy throughout the United States and Canada.

The Mountain Feather Fleece is of easy cultivation, and if given plenty of food, makes a wonderful show equalled by few plants of any description. Give rich soil and ordinary border location.

The illustration gives some idea of the wonderful effect of Stenanthium when in full bloom, but inadequately conveys the beauty of the delicate, feathered, drooping, flowers.

BLACKMORE and LANGDON'S BEGONIAS for BEDDING

A GREAT SPECIALITY.

Special Named Doubles for Bedding.

ARGUS.

Makes a carpet of scarlet unequalled by any other bedding plant. **12/-** dozen, **84/-** per 100.

GLADIATEUR.

Rich crimson; very effective. **12/-** dozen, **84/-** per 100.

HILDA (New).

Deep salmon, with lighter centre, perfect camellia form: vigorous, and of grand habit. **15/-** per dozen.

LORD LANGTON.

Bright scarlet; wonderfully free blooming. **10/-** per dozen, **70/-** per 100.

MARQUIS OF STAFFORD.

Crimson: a well-known and first-rate variety. **12/-** per dozen.

DOUBLE BEGONIAS, Seedling Tubers.

These are of splendid quality, and as our strain possesses an upright habit, which is indispensable in a bedding plant, they are grand for bedding. We offer the following colours: White, blush, pink, rose, scarlet, crimson, yellow, orange. **4/-** per dozen, **30/-** per 100.
In Mixed Colours, **3/-** per dozen, **21/-** per 100.

SINGLES, Seedling Tubers.

These are of superb quality, and are unequalled for habit and richness of colouring, in the following colours: White, pink, rose, scarlet, yellow, crimson (a special line), and orange, **3/-** per dozen, **21/-** per 100.
Mixed—**2/6** per dozen; **15/-** per 100.

FRILLED SINGLE BEGONIAS.

These have created a sensation wherever we have exhibited them the last two seasons. **4/-**, **8/-**, and **20/-** per dozen.

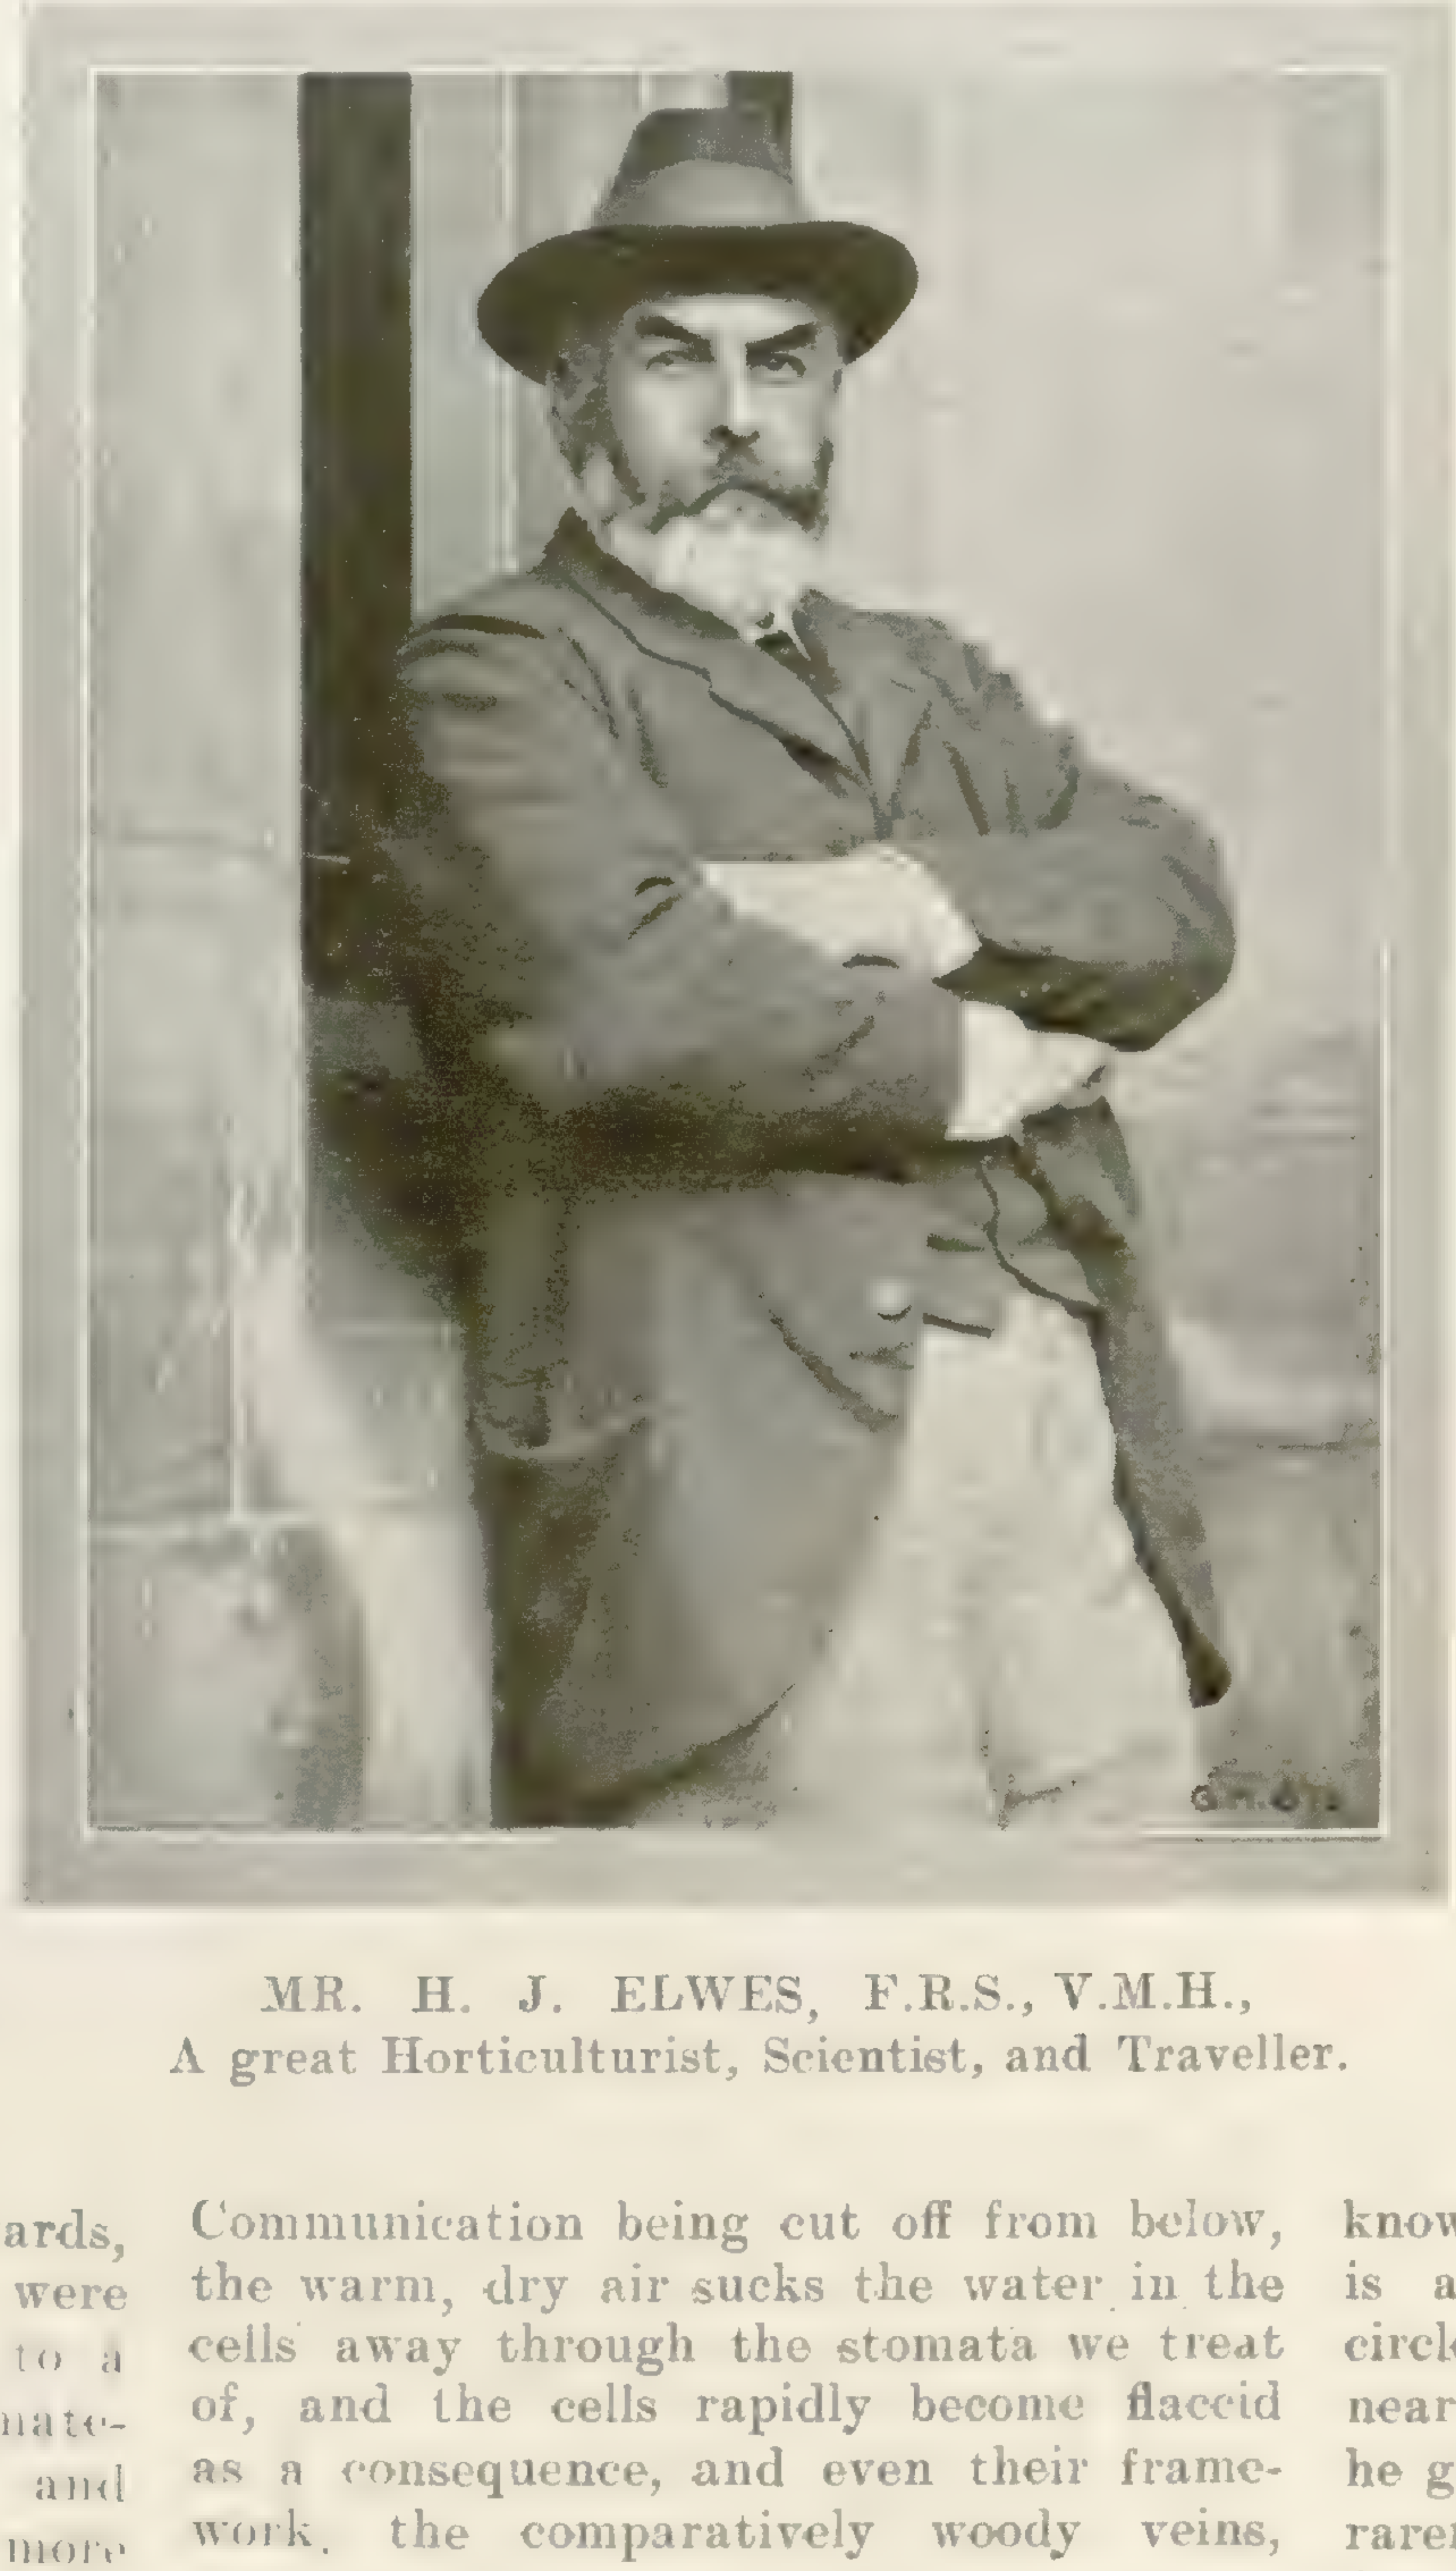
VOL. LII.—No. 2,891. SATURDAY, MARCH 27, 1909.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Transpiration.

If we examine with a microscope either the leaves of trees, shrubs, and other forms of flowering plants, or the fronds of non-flowering plants, such as ferns, we shall find them in most cases profusely dotted with minute perforations of the surface, tiny orifices between the cells which fill up the spaces in the network of veins, which at once form their support and their sources of sap supply from below. These openings are called stomata, from stoma (Greek) a mouth; and are mostly found on the undersurfaces, though their presence is largely determined by the position the leaves assume, vertical leaves having them in fairly equal numbers on both sides. Their minuteness may be judged by the fact that in some plants a square inch may contain between thirty thousand and forty thousand. They vary in shape from oval to round, or even quadrangular, according to the species, and are distinguished by having a tiny wall of cells around them, usually two,of a curved sausage shape, joined at their tips. These openings communicate directly with the cells below the outer skin of the leaves, and one of their offices is to form an outlet for evaporation of water, one object of which is to keep down the temperature in hot weather. A far more important one, however, is that of stimulating the current of sap from the root system upwards, which obviously could not continue were no outlet provided, since the cells, to a very large extent, concentrate the materials supplied by the root system, and conveyed by the sap, in solution, into more or less solid substances, and, hence, have constantly to get rid of the surplus remaining. The intimate correlation which exists between warmth and rapidity of growth is in all probability largely due to this evaporative process, since the growing cells, which, by absorbing carbonic acid gas from the atmosphere, a vital operation which is also effected through the stomata, and combining its contained carbon with the inorganic salts collected by the roots, and conveyed by the sap, provide all the materials of the plant, are naturally stimulated to more rapid absorption of fresh material through their walls, the greater the draught upon them by evaporation at high temperatures. How great this draught is is easily seen by noting how soon the leaves of a severed branch wilt and wither on a warm day.



MR. H. J. ELWES, F.R.S., V.M.H.,
A great Horticulturist, Scientist, and Traveller.

Communication being cut off from below, the warm, dry air sucks the water in the cells away through the stomata we treat of, and the cells rapidly become flaccid as a consequence, and even their framework, the comparatively woody veins, loses its rigidity, and flags in sympathy. When, therefore, in this connection we consider the countless myriads of stomata or perspiration pores which must exist on a huge tree in full foliage, and that every one of these is constantly occupied in pouring forth its minute portion of invisible steam, it seems incredible that a sufficient supply can be obtained by the roots in soil which may be but slightly moist, or that it can be conveyed, as it is conveyed, with sufficient rapidity through that thin ring of living cells which lies beneath the bark of the trunk and its internal core of old wood. If we study the root system we find, naturally, no stomata since we find no leaves, but we find an infinite multitude of tiny absorptive growing points, whose province it is to collect the water required by the cellular system above ground. That under normal conditions of rainfall and sunshine they are competent for the task is clear enough, or the foliage would wilt at once in proportion to the deficit; but none the less is the tree we have taken as an example a living wonder on a bright, hot day, when, nevertheless, it manages to hold its own, and spread its vast expanse of leafage abroad in all its freshness and vigour of growth. There is, however, a wonderful provision in this connection; the stomata, as we have said, are bounded by curved marginal cells, and these cells are so constituted that under dry conditions they contract, and so reduce, or even close entirely, the opening between them, thus acting as check valves. In the process of plant evolution the number of stomata has become varied according to the conditions, dry or humid, of the environment of the species concerned, so that in succulent plants, such as are peculiar to very dry conditions, they are comparatively rare or imperfectly developed.

Mr. H. J. Elwes, F.R.S., V.M.H., is well known in the world of science, and is a prominent figure in horticultural circles. He is owner of Colesborne Park, near Cheltenham, Gloucestershire, where he grows a large collection of the finer and rarer plants, and where he has raised many fine new nerines and other plants. As an arboriculturist Mr. Elwes is particularly famous, and the new work he has published, in conjunction with Dr. Henry, on trees, is a fine example of the excellence of his work. Quite magnificent is his monograph of the genus Lilium, a folio work with splendid coloured plates. Mr. Elwes' contributions to scientific literature have been many, and spread over many years, and comprise treatises on zoological botanical, entomological, and horticultural subjects, delivered before the learned societies. Mr. Elwes is a great traveller, an enthusiastic butterfly collector, and a famous big game hunter. He has travelled in Turkey and Asia Minor, and has visited Tibet, been to India four times, Mexico three times, Russia and Siberia three times, and South America several times; he represented Great Britain at the Botanical Congresses at St. Petersburg and Amsterdam, and was scientific member of the embassy to Tibet in 1886. He has been president of the Entomological Society of London, and a vice-president of the Royal Horticultural Society. Mr. Elwes is a gentleman of strong opinions, and he has the courage of his convictions, as witness his strong opposition to the R.H.S. garden scheme, and his promise of £1,000 towards the R.H.S. hall scheme; his views on the British timber question; and his annual protest against the niggardly policy adopted by the Royal Horticultural Society in connection with the Lindley Library.

The Daylight Saving Bill. It is interesting to find the widest possible difference of opinion with reference to the advantages of this Bill among fruit growers and market gardeners. At a recent meeting of the National Fruit Growers' Association it was opined that not a single fruit grower or agriculturist would be found in its favour, and yet, about the same time, a meeting was being held in Guernsey to consider the matter, and a resolution was passed in favour of the Bill, and a committee was appointed to bring the matter before the Legislative Assembly. The opinion at Guernsey, judged from this meeting, was that the adoption of the Daylight Saving Bill would add hundreds of pounds to the receipts of the growers, by enabling them to ship their produce to England one hour earlier each day during the season from April to September. In Kent the opinion of fruit growers is very much divided upon the question, as evidenced by the diversity of opinion expressed at a recent meeting.

The "Compleat Angler." The most important book in a recent sale of old and rare books, in London, was a perfect specimen of Izaak Walton's "Compleat Angler," of 1653, in original calf. Commencing at £100, the bidding rose to £1,085, at which figure it was purchased by Mr. Bernard Quaritch. Two years ago a fine copy realised £1,290, and a month ago 3,900 dollars was paid, in New York, for an example that was catalogued a few years since by a London firm at £375.

The Berberis Dell at Kew. Kew, in general, is so flat that such diversities of level as it possesses (and they are all of artificial origin) acquire a peculiar value in the landscape. Next to the Lake and the Rhododendron Dell, the most important excavation in the gardens is the Berberis Dell. Originally it was a pit from which gravel was taken to cover the paths. The idea of developing it into a garden for shrubs was entertained as early as 1869. The depression was considerably enlarged during the next five or six years, and by 1876 it had been brought to its present conformation, and planted with trees and shrubs belonging to the early Natural Orders. The species of berberis being the most numerous, it came to be called, perhaps unofficially, the "Berberis Dell." It is one of the most picturesque spots in Kew, the apparent depth of the hollow being increased by its proximity to the mound on whose summit the flagstaff stands—once the site of the Temple of Victory. A new entrance to the Dell has, says the "Kew Bulletin," recently been made from the Kew Road side. The path that runs parallel with the wall is now a very popular walk, but access from it to the Dell was previously rather restricted. The new entrance gives an extended view right through the valley in a north westerly direction to the Pagoda Vista and beyond.

British Botany at South Kensington.—The rearrangement of the botanical gallery of the Natural History Museum at South Kensington has been completed by Dr. Rendle. The great plant groups of flowering plants, ferns, mosses, seaweeds, and fungi are illustrated by specimens, models, and pictures. The display of British flowering plants, ferns, and mosses, in frames, is excellent, and renders reference quite easy. The illustrations of British plants, by Miss E. N. Gwatkin, are available for consultation, and afford a ready means, together with the models and specimens, of identifying native plants. The new arrangement will appeal to the amateur botanist, to the collector of British plants, and to lovers of our native flora, more than to the botanical expert, and it should serve greatly to popularise and broaden the interest in the plants and flowers of the country-side.

New Gardeners' Society at Twickenham. — Although Twickenham possesses a horticultural society, certain energetic spirits have deemed it desirable to start a Gardeners' Mutual Improvement Society in the pretty Thames-side town. There was an enthusiastic inaugural meeting, under the presidency of Mr. James Bigwood, M.A., and Mr. W. H. Page, of Tangley Nurseries, Hampton, decorated the meeting room at the Town Hall with arums, carnations, and daffodils. Mr. Bigwood was elected president, and Mr. Alfred Watkins, the wholesale seedsman, of Tavistock Street, Covent Garden, was elected vice-president. Mr. Wheeler, who has had experience of gardening societies at Egham, was elected hon. secretary.

Trees and Town Gardening.—Mr. Andrew Kingsmill, of Harrow Weald, writes: On p. 209 of the GARDENERS' MAGAZINE (March 13), Mr. Walter H. Aggett states: "Mr. Hayward truly remarks that the town gardener is placed at a very great disadvantage in every way, not the least being his inability to cultivate successfully more than a very limited number of trees and shrubs, or flowering plants." It is not for me to question the statement as to inability, but I strongly protest against the perpetuation of the error that the number that "can" be successfully cultivated is limited. Of trees alone, there are in good condition in the London parks to-day over one hundred distinct species!

National Dahlia Society.—The schedule of the two exhibitions that will be held by the National Dahlia Society in September next has been issued. We are pleased to see that at both exhibitions classes are provided for cactus dahlias specially adapted for the decoration of the garden and home. Classes are also provided for paeony-flowered dahlias, which hitherto have not obtained full recognition from the society. This expansion in the policy of the National Dahlia Society, with a view to bringing into greater prominence these varieties of special value for beautifying the garden and the supply of blooms for indoor decoration, should quicken an interest in the work of the society, and materially help in the augmentation of the list of members. With the schedule is issued a supplement for the current year to the society's official catalogue, which contains selections of varieties belonging to the several classes, and should prove of much value to cultivators generally.

Appointment of Inspector of Surrey School Gardens.—Mr. A. E. Burgess, for several years lecturer on gardening to the Hertfordshire County Council, has been appointed Inspector of School Gardens under the Surrey Education Committee. The post became vacant by the resignation of Mr. John Wright, V.M.H., who felt himself unable to undertake the heavy duties. During the past three years Mr. Horace J. Wright has carried out the work on behalf of his father, and before advertising the appointment the Education Committee offered him the permanent inspectorship, but his other engagements prevented him from giving his whole time to Surrey.

Rare British Butterflies. On Tuesday the collection of British butterflies formed by the late Mr. J. Pardoe was sold by Mr. J. C. Stevens. Many rare species were included, and no fewer than twenty-one examples of the extinct Large Copper (Polyommatus dispar) were disposed of: the best price made was £5 [illegible] a fine large male, while another specimen nearly equal was sold for £3 15s.

Presentations at Battersea.—On the occasion of the annual dinner of the Battersea and Wandsworth Chrysanthemum Society, Mr. W. J. Stringer, who has for many years been chairman, was, on his retirement, presented with a [illegible] life-size, framed portrait of himself, and Mr. W. J. Lavender, the retiring secretary, was presented with a pair of bronze Marley horses, suitably inscribed on the marble base, in silver. Both these gentlemen have served the society faithfully for many years, and, though retiring from office, they will continue to give the society the benefit of their experience.

The Wolverhampton Floral Fete, the dates of which have been fixed for July 13, 14, and 15, will be of special interest from the fact that it will be the twenty-first of the great flower shows that have been held within the borough. To mark the coming of age of these important gatherings, the committee have materially increased the prizes in the leading classes, and offer a silver vase of the value of £[illegible] (or £50 in cash) for the most meritorious and effective display in the show, which may be selected by the judges from either the competitive or trade exhibits. The more important open classes for plants include a display of plants in or out of bloom and cut flowers in which the prizes aggregate £100, and group of ornamental foliage with prizes amounting to £57 10s. Roses have had liberal provisions made for them, and in the great class for 72 distinct varieties the prizes range from £20 [illegible]. Prizes of the value of £30 are offered for an arrangement of hardy flowers, and of the value of £10 10s. for a collection of delphiniums. In the section for fruit a class is provided for a display of fruit trees in pots, with a first prize of £20

A Large Arum Spathe. [illegible] Savile Reid, in drawing attention to the great variation in size among the spathes of arum lilies, states that he measured the longest examples in his garden at [illegible] Elms, Yalding, and found one 7[illegible] wide, and 8¾ inches long from base to tip, with an inch of "tail" projecting beyond. This, he remarks, seems unusually large, and he would like to know what are the usual dimensions of a big arum spathe.

LATE CROPS OF FORCED STRAWBERRIES.

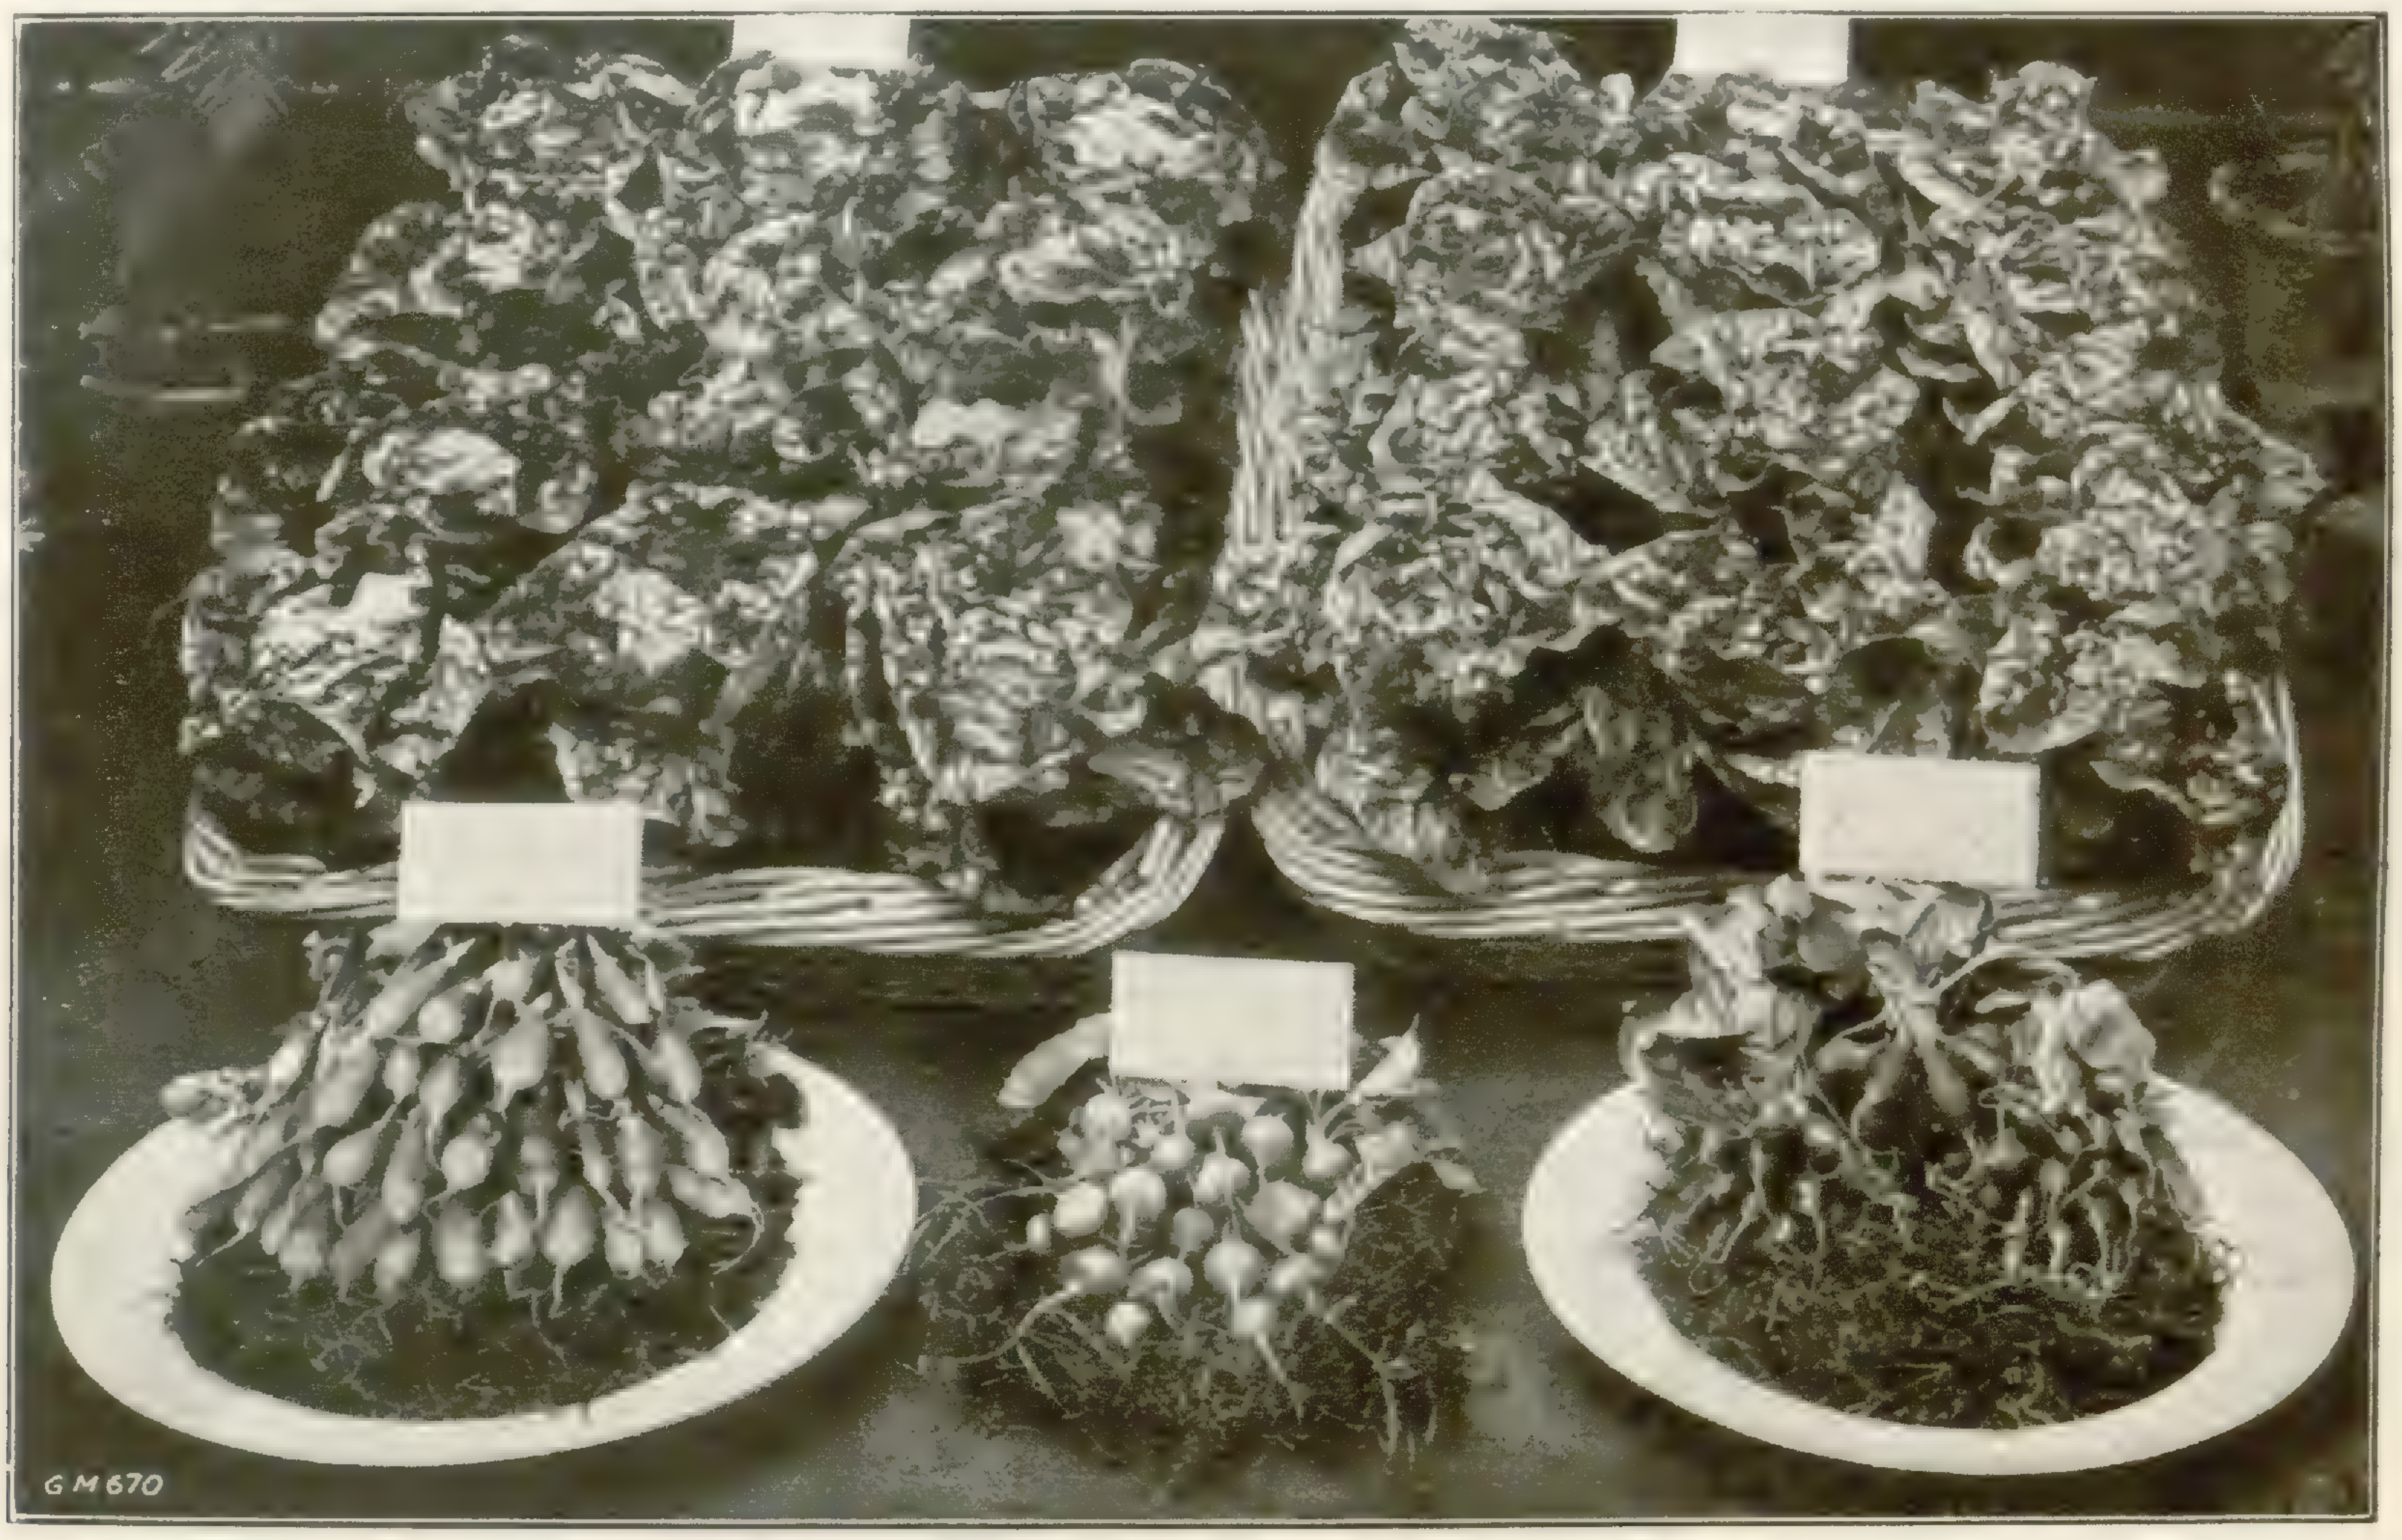
The term "forced" has been used in the heading of these notes, though it may be found not wholly applicable. Great pains are taken in many gardens to secure crops of ripe strawberries as early in the year as possible, but these exceptionally early crops are not gained without special means, and, in some instances it is feared, a considerable sacrifice of plants. Even when obtained the fruit is not of high quality, and really not worth the trouble and expense incurred in producing it. In cases therefore where an insufficient number of plants are grown to keep up a supply of fruit from the earliest date it can be secured to the time fruit can be gathered in the open, it is unwise to force very early, and thus make sacrifices of both quantity and quality, when much better results, both as regards the weight of crop and the flavour of the fruits, can be comparatively easily secured, by starting the plants into growth at later dates.

When preparing plants for the later crops similar cultural details must be followed as are necessary for early forced plants, but the cultural details for the fruiting season may with considerable advantage differ in some respects. The best early forcing varieties, such as Royal Sovereign, Vicomtesse Héricart de Thury, and La Grosse Sucree, answer also very well for late crops; in fact, though we keep up (from pots) a supply of ripe fruit throughout the forcing season, and until after we gather outdoors, we grow but one variety—Royal Sovereign, for the purpose, except that we sometimes test a new variety. By-the-bye, we are trying Reward this year. There are nevertheless several strawberries that succeed admirably for mid-season and late crops that do not respond to early forcing.

As the days have lengthened, and the sun become powerful by the time late crops are swelling and ripening their fruit, it is not advisable, as in the case of early crops, to afford the plants the most sunny positions, for if subjected to these conditions, even when under very careful management, it is difficult to avoid attacks of red spider, and the evil effects from drought, and should these perplexities be overcome the fruit is seldom, especially in bright seasons, of such good quality as when it is not so much exposed to the full force of the sun. For this reason houses, or pits, having a south aspect cannot be recommended for these late crops, span-roofed ones running from north to south, or lean-to ones facing east being more suitable. In these the plants and their fruits escape the effects of too much exposure to the sun, and under proper treatment the crop swells, colours, and ripens perfectly, and, moreover, attains a high degree of flavour. We make use of a large hip-roofed house with an eastern aspect for late crops, but had we no other convenience for this purpose than a house facing south, we should shade with thin tiffany through the hottest part of bright days. I have seen excellent late crops grown in cool pits, both with plants in pots and planted out in beds.

There are points attending the culture of late forced strawberries that may be easily overlooked, and among these may be mentioned the necessity, owing to growth having advanced before they are placed under glass, of timely attention to top-dressing and watering while the plants are still in the open, and also to protecting the blossom buds from frost. It is particularly important in low situations that the latter precaution is taken in the case of plants in open quarters, otherwise, when the blossoms expand their centres are likely to be found blackened, and the prospect of a good crop is gone. T. Coomber.

The Hendre Gardens.



MESSRS. SUTTON AND SONS' EXHIBIT AT R.H.S. MEETING, ON MARCH 9, OF EARLY LETTUCES AND RADISHES GROWN UNDER THE "FRENCH" SYSTEM.

EARLY LETTUCES AND RADISHES.

As "French" gardening is being so much talked about and written about, the exhibit of early lettuces and radishes made by Messrs. Sutton and Sons, Reading, at the meeting of the Royal Horticultural Society on Tuesday, March 9, was of special interest. It served to show that it is by no means an absolute necessity to sow the varieties grown by the Parisian maraichiers, as has been so frequently asserted. The Messrs. Sutton adopted the French method of frames and hotbeds, and made up the beds in December last, sowing them with carrots and radishes, and planting lettuce in them, from sowings made under cloches in October. During one cold spell 27 degrees of frost was registered. The radishes used were Earliest of All, Forcing Carmine, Paris White-tipped, and Sutton's Forcing French Breakfast, and these were excellent produce. The varieties of cabbage lettuce grown were Commodore Nutt, Improved Tom Thumb, Golden Frame, and Early Paris, and the varieties of Cos lettuce were Nonsuch and Little Gem. The cabbage lettuces were beautiful examples, of good size, very green, fresh, and tempting, and they proved once more that in private gardens there is no real difficulty to be overcome in providing early salads where they are in demand. We were informed that the varieties named were in advance of the French varieties said to be essential, though all were grown under the same conditions.

Currants and Gooseberries.—Cuttings which were put in during the past season should, as soon as the soil is in a fit condition, be well firmed in their positions by treading; these are very apt to become loosened by frosts, and will not emit roots unless the heel of the cutting is in close contact with the soil.—G. Woodgate.

BEAUTIFYING BANKS.

Banks are generally an advantage in a garden, but they can only be said to really improve it when they are well and suitably planted according to their size and situation. They act as screens from roadways or house windows, shut off ugly views, and also as shelters from cold winds or hot sunshine, for the ground on either side of them is bound to be either warmer or cooler. This means that where there are numerous banks the facilities for growing delicate and shade-requiring plants are greatly increased. Perhaps, however, the greatest merit of banks is their creation of "views beyond," and their relief to a flat level of garden.

Faulty bank planting is too commonly seen. Ordinary shrubs and perennials are exposed to extraordinary influences, mostly chills upon summits, and so struggle to keep alive, and are weakly in foliage and blossom, a disgrace to the pleasure grounds; yet there are sufficient robust subjects that would have thriven luxuriantly in their stead.

For giant banks shutting off north winds from the garden beyond there can scarcely be a better covering than one made up of Berberis aquifolium, gorse, and hypericums, both shrubby and herbaceous. For a bank in a rough spot, say of the wild garden, or one dividing a side lawn from a field, varieties of rubus, the hardy fruiting brambles, look well, especially if interspersed with hartstongue and other robust ferns.

Seaside banks were once considered difficult to cover satisfactorily, but experience has proved that there are native and other shrubs and plants in plenty that will succeed to perfection. The feathery tamarisk never looks so well as when accompanied by eryngiums and echinops, with some bracken fern, gorse, and heather. Other subjects for coastside banks are aucubas, kept rather dwarf, Berberis aquifolium, Berberis Darwini, Berberis stenophylla, which blooms from spring until winter; the prickly Berberis virescens, box, in the ordinary type of Buxus sempervirens; Cistus ladaniferus, on sunny south slopes; Escallonia macrantha, in the same positions; euonymuses, Hippophæ rhamnoides, which is the sea buckthorn, a tall-growing, yellow-flowered and berried shrub; Spiræa japonica, Veronica Traversi, laurustinus, and American currants.

An original looking shrub for an inland garden bank is Stephanandra Tanakæ; this grows in a spreading fashion, and is valued for the peculiar bronze, copper, rose, and red shades that its giant leaves take on in the autumn, though the foliage, when green, is sufficiently attractive to warrant its being far more planted. Another pretty shrub of horizontal growth is Viburnum plicatum Mariesi, the cream florescence of which is remarkably effective; Hedera helix conglomerata will cover soil under tree and shrub branches with masses of waved, darkest green leaves, so proves serviceable where little else will thrive. There should be no ground left unclothed upon a bank, in order that the appearance may be one of great luxuriance; the winter aconite, periwinkles, Tussilago fragrans, Stachys lanata, Santolina chamæcyparissus, the lavender cotton, and London pride will be found exceedingly useful for shaded carpets.

The southern bankside in a fairly sheltered garden in which gales do not create much havoc, offers the gardener a splendid opportunity. A rare effect can be easily achieved by planting Pyrus japonica in its three shades of scarlet, white, and pink, and training the branches all over the slope, using stout double wooden pegs to hold them down. Another plan is to give up the bank to hardy azaleas and Daphne mezereum, alternated with clumps of either outdoor chrysanthemums or Michaelmas daisies. Another scheme, suitable for a western bankside, consists of pink and white spiræas, herbaceous and shrubby, alternated with groups of briar roses.

Of course, Wichuraiana roses offer a fair covering, indeed, the varieties now being so numerous and of such varied tints it is an improvement to plant here and there among them single bushes, or groups, of the little white Scotch rose, which has so hardy and compact an appearance. In addition to planting banksides with shrubs and perennials, bulbous plants should be plentifully cultivated, since they give colour and fragrance at an early season, and do no harm to their neighbours. Banks of chrysanthemums would be highly meritorious but for the fact that they are not attractive until August, but if sufficient narcissi, Darwin and cottage tulips, Spanish irises, and montbretias are set among them this reproach is not of serious importance.

Low foliage and floral coverings have an uncommon look; these are made by massing dwarf plants in groups, especially those which, like pinks, have a double attractiveness; evergreen perennials should be largely represented, for the winter show made by sedums, saxifrages, vincas, thymes, iberises, arabises, aubrietias, cerastiums, stachys, heucheras, and pinks is of incalculable value. Pansy and viola clothed banks are pleasing, especially near the windows of a house; potentillas and the wild strawberry are admirable associates, while the natural beauties of woodland scenes may be imitated by a judicious mingling of turf with primroses, violets, hairbells, brambles, honeysuckles, anemones, bluebells, and foxgloves.

M. H.

GLOBE ARTICHOKE.

The globe artichoke differs considerably from the Jerusalem artichoke, as the edible portion is produced at the apex of the shoots, which attain a height of five or six feet if they are cultivated on suitable ground. A deep, moist, rich soil is necessary for the production of large, fleshy heads. The soil which is intended for forming a plantation of this delicious vegetable should be deeply trenched, working in a liberal supply of farmyard manure as the work proceeds.

The quickest way to form a plantation is to put out strong suckers in April, keeping them well supplied with water whenever they appear at all dry. And when they are beginning to show their "heads" liquid manure should be given them frequently, which will greatly assist them in producing their crop.

Some growers prefer to raise plants from seeds, and when this method is adopted March is the best time for making the sowing of seed. The distance that is most suitable to ensure strong plants is about four feet each way. When the crop is over the stems may be cut down, and before hard frosts occur the crowns should be protected with long litter and ashes. When the severe frosts are over the litter can be removed and the suckers thinned out, leaving about three of the strongest on the old plants. Then add a liberal dressing of manure, and fork it in, taking care not to injure the roots of the plants when doing the work.

It is always as well to have some young suckers growing into eight-inch pots, and kept in cold frames ready for replacing any that die off.

T. W. Birkinshaw.
Hatley Park Gardens.

DECORATIVE DAHLIAS.

Some very fine additions have been made in recent years to the dahlias suitable for garden display, and a number of the French varieties are of extraordinary dimensions, and have gorgeous colouring. As garden plants, and to produce a fine effect, they stand unrivalled, and I would strongly advise that they be employed as background plants in the borders, etc.

Souvenir de Gustave Douzon is as large as a breakfast plate, and the flowers are a brilliant red colour. It attains to a height of seven feet, and the plants are invariably smothered with flowers until stricken by frost. Further, it forms a splendid tuber, so that a fine stock can be worked up from a couple or three plants the following season. A giant form, but white, and a fitting companion to the foregoing, is Madame Helen Charvel. Extremely beautiful also is Jeanne Charmet, with white-ground flowers shaded with lilac and yellow. Madame A. Lumiere is pure white tipped with reddish violet and a most attractive variety, while the older Grand Duc Alexis is both bold and distinct, with its rolled petals, usually of spotless purity, though now and again a light shading of lilac appears upon some of the flowers, which enhances their beauty.

The pæony-flowered dahlias are also characterised by immense proportions, and have been well represented in the public parks during the last two seasons. They produce a fine effect when massed, and in spite of powerful rivals will, I think, find a place in most gardens. The most strikingly effective are Garibaldi, intense crimson with very prominent golden-yellow anthers; Gloire de Baarn, a splendid shade of lilac; Duc Henri, scarlet-crimson, and very fine; Dr. K. W. van Gorkum, white and lilac; Reine Emma, lilac and yellow; Germania, a fine shade of crimson; and Baron de Grancy, pure white. The price of many was rather prohibitive last season, but now they have become distributed they will be available at a cheaper rate.

Writing of dahlias reminds me that earwigs can be kept at bay by damping the plants overhead late in the evening, and where these nocturnal pests are very troublesome this should be carried out in conjunction with trapping. As far as my experience goes earwigs devour young plants and growths ravenously, but trouble the plants very little when they reach the mature stage. To trap them wholesale rolled brown paper or sacking should be fixed to stakes a couple of feet high, and I would advise that this trapping be carried out a week or two before plants known to be liable to attack are placed in their permanent quarters.

Walter A. Aggett.

Swift Moth Caterpillars on Pæonies.—Specimens of pæonies, of which a large number had been badly attacked by a caterpillar, were sent to the Board of Agriculture from Surbiton. The pest was identified as the Swift Moth caterpillar (Hepialus), and no fewer than [illegible] caterpillars were found in the material sent for examination. These caterpillars are very voracious, and attack the roots and underground stems of both cultivated plants and weeds. On a small scale they could be combated by the injection of bisulphide of carbon, but on large areas [illegible] should be prong-hoed into the soil, and they may be combated by similar methods to those applicable in the case of [illegible] caterpillars.

EARLY DAFFODILS.

Very few indeed will be the daffodils that "take the winds of March with beauty" this year, owing to the extreme lateness of the season; but, fortunately, we may gently hasten daffodils in our greenhouses and frames, and not seriously impair the vigour of the plants thereby, provided they are not forgotten when they have finished flowering. Forcing, as generally understood, is quite another subject. We now refer to the increasing popularity of daffodils in pots for home and conservatory decoration in March, and very little heat is necessary to produce flowers during that month. The essentials are early potting, a sojourn out of doors under ashes until an abundance of roots have formed and leaf growth commences, and then a place in a light frame, from whence batches may be transferred to a warm greenhouse. Under these conditions the flowers come fine and clean, and they last a very long time, as compared with flowers that have travelled hundreds of miles before they reach us.

Many of the newer and finer daffodils should be grown in this way, as their exquisite beauty can then be enjoyed by those members of the household who may not care to risk the treacherous spring weather out of doors, and also by those who, having paid a fair price for the bulbs, do not care to consign them to mother earth and run all the risks of climate and enemies. As already pointed out, if the plants are gradually hardened off when the flowers are over, and watered as necessary, the bulbs may be saved for forming little colonies of select varieties out of doors another season.

At the recent show of spring flowers held at the Royal Horticultural Hall, Westminster, Messrs. Cartwright and Goodwin, of Blakebrook, Kidderminster, exhibited one of the best grown collections of early daffodils we have seen. Both flowers and foliage were finely developed, and the varieties were especially good ones. These included the perfectly formed Victoria, and such gems as Circlet, Waterwitch, Blackwell, Lucifer, Beauty, Fairy Queen, Chaucer, Scarlet Eye, Sunset, Aspasia, Felicity, Grandee, Emperor, Empress, Autocrat, and Firebrand. We may add that these flowers were admirably staged in a setting of Isolepis gracilis.

MESSRS. CARTWRIGHT AND GOODWIN'S EXHIBIT OF EARLY DAFFODILS AT WESTMINSTER ON MARCH 9.

ANNUAL CHRYSANTHEMUMS.

What may be termed the Star group of annual chrysanthemums are such great improvements upon the ordinary carinatum and segetum kinds that they should be included in all gardens where useful and showy plants are required. Although supposed to be hardy, very few survive severe winters, their growth is too soft and their stems too hollow to withstand much freezing and thawing, consequently they collapse, and better results are to be had by raising those for the earliest flowering in a little warmth, transferring them to the borders during May. For later use thin sowing where it is intended the plants should bloom is the best course to follow, and it is because they are too thickly sown that such unsatisfactory results are often seen in flower borders. Given plenty of space, each plant will form a compact bush with many lateral growths each crowned with good flowers; but grow them thickly like larch in a plantation, then each individual will be crowned by one flower, and the side issues will be too weak to produce any, while the whole thing quickly collapses, and is often condemned as an unsatisfactory plant when cultural defects are the cause of trouble.

The latest novelty to this section is Northern Star. Mr. Watkins kindly sent me seed of this to test last summer, and it deserves attention from all who are looking for an annual that keeps fresh in appearance and blooms continuously the whole summer through, providing, of course, that it is not allowed to seed. It is also a very fine plant for greenhouse decoration in pots, and for that purpose it should be raised in October and be kept growing slowly all through the winter months, potting it again in the early days of February; indeed, several of the varieties are extremely useful as pot plants and give very little trouble.

I have found for general effect that seed sown during early March in a pan or pot in a warm house and the seedlings pricked off into 3½in. pots separately, when large enough, will, when properly hardened and planted in the borders during May, give the most satisfactory returns, and, as each plant may be given a definite space, there is no overcrowding. Of course, the growth made follows the condition of the border to some extent; if rich and moist, each plant will spread at least two feet across, but less if the soil is poor and dry.

Following Northern Star is Eastern Star, and this is a soft yellow variety with a very distinctive dark eye; it is a very telling plant growing and also valuable for the production of cut flowers; in fact, all of these single forms are in great demand for cut purposes because they are so lasting when placed in water. Morning Star is of a pleasing yellow colour, and the flowers are of good form, produced on good long stems. Although the first improvement of this type, it is not the least desirable, and if limited to two of the varieties, this and Northern Star would doubtless be my choice. Evening Star, a more decided colour than any of the others named, is golden yellow; it is as free-blooming as the others named, and if carefully placed near some purplish colouring, it will add to the general effect of any flower border.

Charles Foster.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read Chrysanthemums for Garden and Greenhouse, by D. B. Crane, price 2s. 6d. net; or by post, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

FAVOURITE VARIETIES OF TOMATOES.

There is a wide difference between tomato culture of the present day and twenty years ago. The fashion has changed from mere individual size to that of more economic and less vulgar proportions. It comes well within the memory that a score or more of years ago there was a craze for the largest possible size, apart altogether from culinary or dessert use. Fruits of 2lb. and over were the ambition of the enthusiast, and well can I remember the pride that followed their production. This has now changed to an every-day demand for medium-sized tomatoes, though even now, it is observed that judges sometimes favour large samples at the vegetable shows. Of course appearance rather than utility are ruling points in such cases, and such decisions do not govern the every-day purposes of tomatoes. For culinary purposes high quality, combined with moderate size, is the chief essential, and properly so.

PERPETUAL CARNATION MELODY.
Flowers sort rose-pink.

Though it would seem that the climax had been reached as regards stocks and names, long since, yet it is found that new ones, even if not quite so numerous as a few years since, come now from various sources in goodly numbers. It is wonderful what a clamour there is even at the present time for a variety whose character has been praised by reputable growers. There is no doubt but that deterioration takes place when stocks are kept too exclusively select, and when this happens there is less satisfaction and profit in the results. There is not quite the same troubled experience as regards disease as was common to everyone a few years since. Science has helped us, and it is fortunate that this is so, for the tomato-growing industry has assumed such magnitude that the disease fiend in its several forms seriously threatened the tomato trade.

What a change has come over the choice of varieties since the days of the Old Red, Orangefield, Hepper's Goliath, and other kindred strains of corrugated fruits. Such sorts, in the present day, would have no chance, and yet twenty years ago the Old Red was a favourite with many. Conference, Frogmore Prolific, Ham Green Favourite, Holmes' Supreme, Hathaway's Excelsior, Lister's Prolific, Comet, Up-to-Date, Sutton's Perfection, and Winter Beauty, have each claimed in their day honourable positions in the estimation of large and small growers alike. There are, of course, a multitude of others that have had their merits extolled and their praises sung, but as time advances these have dropped out in the race for supremacy, and their names become memories only. Two of the most popular of to-day's tomatoes are Carter's Sunrise and Moneymaker. These have acquired fame because of their heavy crops of useful sized fruits, and, moreover, they have good constitutions which evade disease attacks. Quality, shape, and colour are points that tell in the race for priority, and these several merits are embodied in these varieties to a degree of perfection that places them beyond criticism. The ideal would seem to have been reached in these, but who can say how long they will maintain their unchallenged position, or what fertile mind is engaged on evolving something better?

Not many tomatoes are honoured with the R.H.S. certificate; perhaps one of the oldest among the foregoing names is Ham Green, a famous variety in its day. Sunrise, Winter Beauty, and Frogmore Selected are a small group of favourite sorts. Veitch's Dwarf Red stands out prominently as a certificated variety, and reports from growers justify the favour it has obtained.

Yellow-fruited tomatoes seem slow in gaining commercial status; the public has been so educated up to the uniform red fruits that they look askance on the golden ally. Connoiseurs, however, proclaim them as superior in a dessert sense to the red-skinned fruit, and we have many instances where this opinion has been supported when prejudice has been overcome and a trial permitted. But without this directly forced persuasion they seem to be passed over as ornamental only, and not intended for edible purposes. At least two of the golden-skinned strains have been awarded the coveted F.C.C., i.e., Sutton's Golden Nugget and Veitch's Golden Jubilee. Sunbeam I have proved to be high class in every particular. These do not crop quite so heavily as the better stocks of red fruits, hence would not pay the market grower.

W. Strugnell.

Rood Ashton Gardens.

PERPETUAL CARNATION MELODY.

Notwithstanding the many fine new perpetual-flowering carnations that have been introduced recently, there are many growers for market who still regard the famous Mrs. T. W. Lawson as one of the most profitable. In private gardens also, while new varieties are grown, and some retained, it is the usual custom now to grow good batches of Mrs. T. W. Lawson and Enchantress. There have been numerous sports from Mrs. T. W. Lawson, and these are all meritorious. One of the prettiest of these is Melody, a new variety of 1907; it has rosy-pink flowers of a rather deeper shade than Enchantress, and it carries these on stiff stems of good length. The growth is compact, erect, and stout, and does not fall about or need so much support as is the case with some other varieties, and a further advantage is that the colour does not fade out quickly in sunshine, as unfortunately it so often does in the case of rosy and blush shades. Melody is a variety that appeals to many growers, especially in private establishments; it received a First Class Certificate from the Royal Botanic Society. Mr. H. Burnett, of Guernsey, has shown this variety particularly well, but other growers have included it in their exhibits recently.

A FEW GOOD ALPINE SPRING FLOWERS.

The spring flowers which I enumerate here are not novelties, neither are they rarities in the strictest sense, but, unfortunately, they are not so frequently seen in gardens in spring, as are bedding pelargoniums and calceolarias met with in summer. It appears that many amateurs have not yet realised the wealth existing among rock and alpine plants, and as even the best classes of alpines are comparatively inexpensive at present, it seems reasonable to insist upon their extended culture. In many gardens hybrid aquilegias are successfully grown, but species like A. alpina and A. glandulosa are frequently ignored. The first is easy to grow in any soil, but A. glandulosa prefers a light moist soil, free from lime, and it generally succeeds best in a position lightly shaded; in winter the crowns must be safeguarded from the ravages of slugs, and then in spring the pretty pale blue and white flowers are unfolded, fine in form, and rich in colour.

Anemones scarcely contain anything finer than the deciduous species, A. alpina and A. sulphurea; the latter has soft yellow flowers on 18in. stems, carried well above the fern-like foliage: it is generally regarded as the granitic form of A. alpina, at any rate it fails on our chalk soil, only succeeding in that specially prepared with peat and loam. A. alpina produces white cup-shaped flowers, which are pencilled with slate colour on the reverse of the petals: the addition of peat to the soil is beneficial, as it retains moisture during periods of summer drought.

In Hutchinsia alpina we have a common but valuable plant, in that it clothes the soil with rich pale green foliage during winter, and in spring it breaks into a snow-like carpet with its flowers. It has no merit whatever as small plants, but in drifts a yard or two across the green tone is exceedingly restful and refreshing to the eye. It also forms an ideal carpet through which dwarf narcissi, or, in fact, any dwarf bulbs will push, and be protected from soil splashing.

Iberis gibraltarica forms a loose, sprawling shrub when over a year old, but if the stock is kept replenished by seedlings or cuttings, those which have flowered for two years in succession can be discarded with advantage. It forms a most satisfactory rock plant for extra-dry positions in the hottest, sunniest exposure; the flowers are largest upon young plants, and the colour is a rich and pleasing shade of rose-lilac.

Omphalodes verna is a spring treasure, anticipating the forget-me-nots, with its rich blue flowers that also resemble them in form. The leaves are much larger, and of a cordate shape. Along with Tiarella cordifolia it makes an excellent plant to associate with hardy ferns in a slightly shaded spot, and as both root by means of stem-like runners, it is well to grow them under semi-wild conditions.

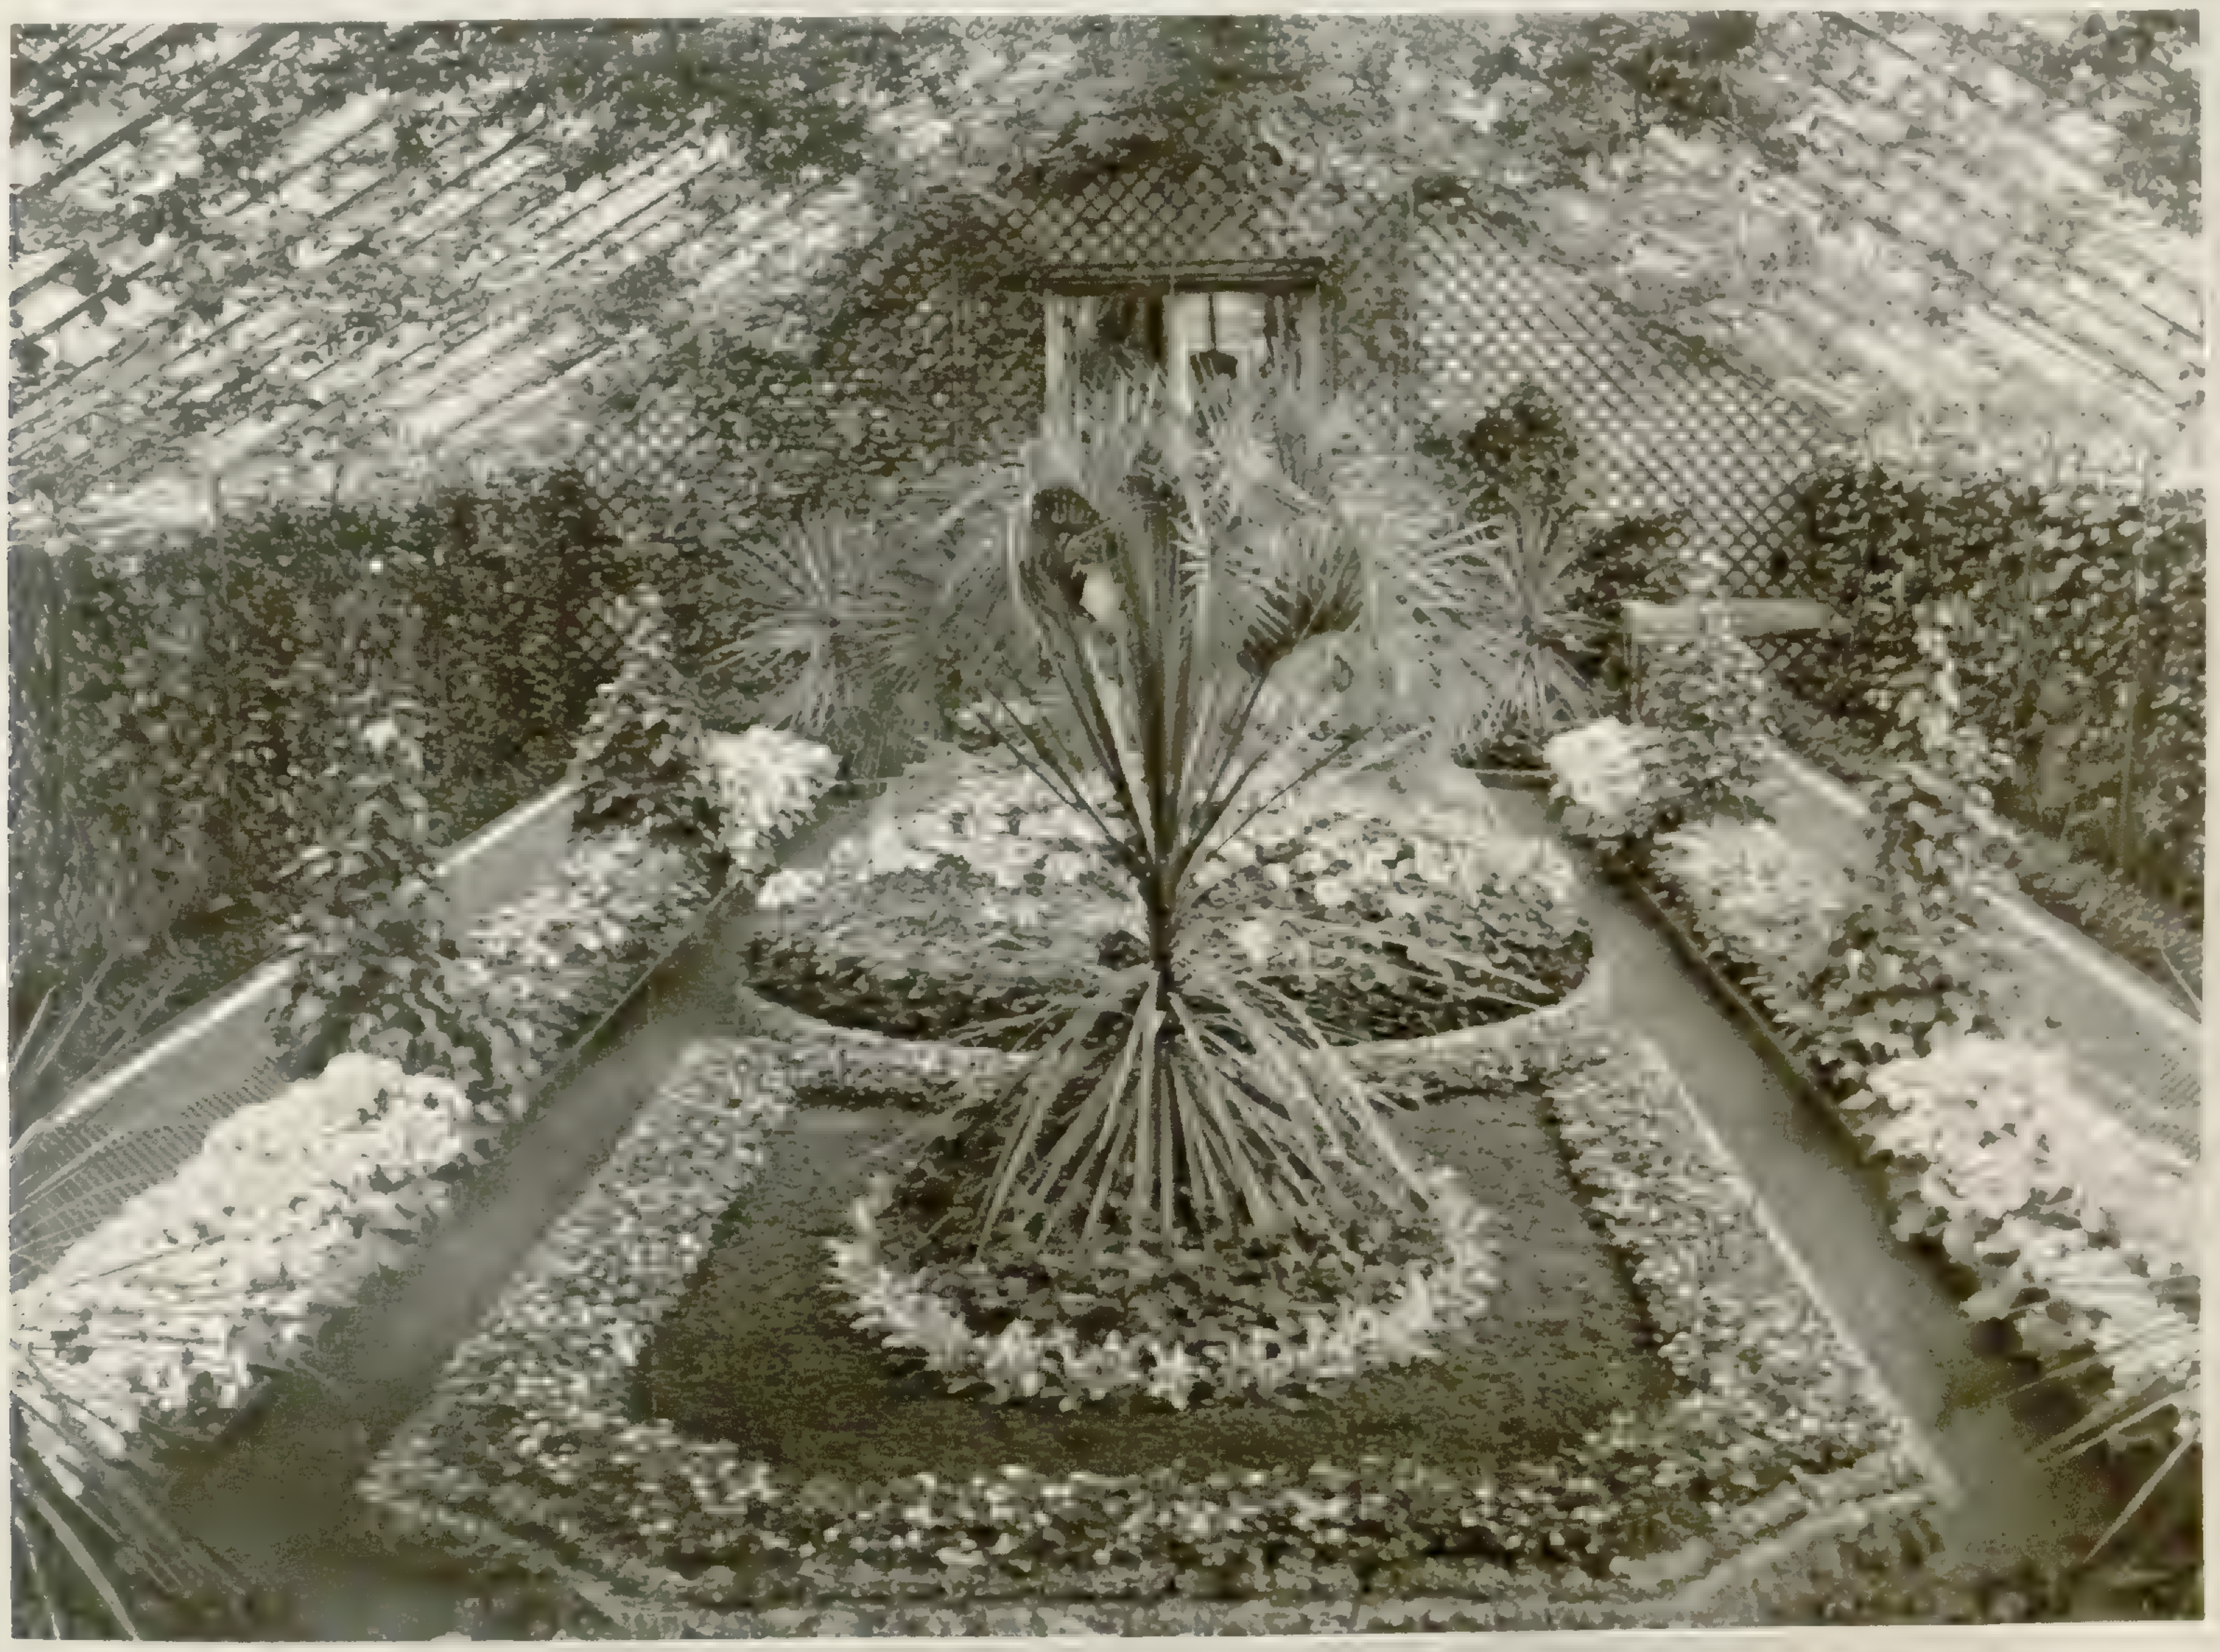
At least two primulas should be included in every spring rock garden, and if planted in a colony the effect will be very fine. Primula rosea is a clear pink-flowered species from the Himalayas, and succeeds to perfection in ground that is always moist. The flowers are produced as early as March on stems varying from 6 to 12 inches in height, and these are always in advance of the leaves. Primula viscosa alba (nivalis of gardens) prefers somewhat drier conditions: the flower heads are like snowballs borne upon short stems that appear as if unable to support the weight of blossom, and for this reason a position above the ground level when planting adds to its effect when in flower.

Saxifraga Burseriana is one of the earliest rock plants to flower, as it is distinctly one of the best; the growth is tufted, each stem being close set with needle-like leaves; the flower stems are scarlet supporting snow-white flowers, which are relatively large for the size of the plants. Major is a stronger and earlier-flowering variety of the type.

Walmsgate Gardens. **Thomas Smith.**

A NOVEL WINTER GARDEN DESIGN.

The interior of a winter garden may be as different from any other as its exterior. The builder has most to do with the design of the building, but the owner and gardener have all to do with the effect produced within. The accompanying illustration shows part of the interior of the winter garden at Baron Rothschild's garden at Vienna, and represents a very distinct and novel method of arranging the plants and flowers. The usual staging is dispensed with, and the general design is that of a flower garden. Some of the plants are planted out, others are plunged to the pot rim, but the effect of flower beds and borders is produced. There are ample paths for promenading, and the "lawns" are of Selaginella denticulata. Chinese primulas, zonal and show pelargoniums, variegated and flowering abutilons, Cineraria maritima, dwarf begonias, ageratums, cordylines, and palms are the subjects chiefly used in that part of the winter garden illustrated. We do not present this illustration for the purpose of urging that the style it indicates should be copied in this country, but rather because of its novelty and suggestiveness.

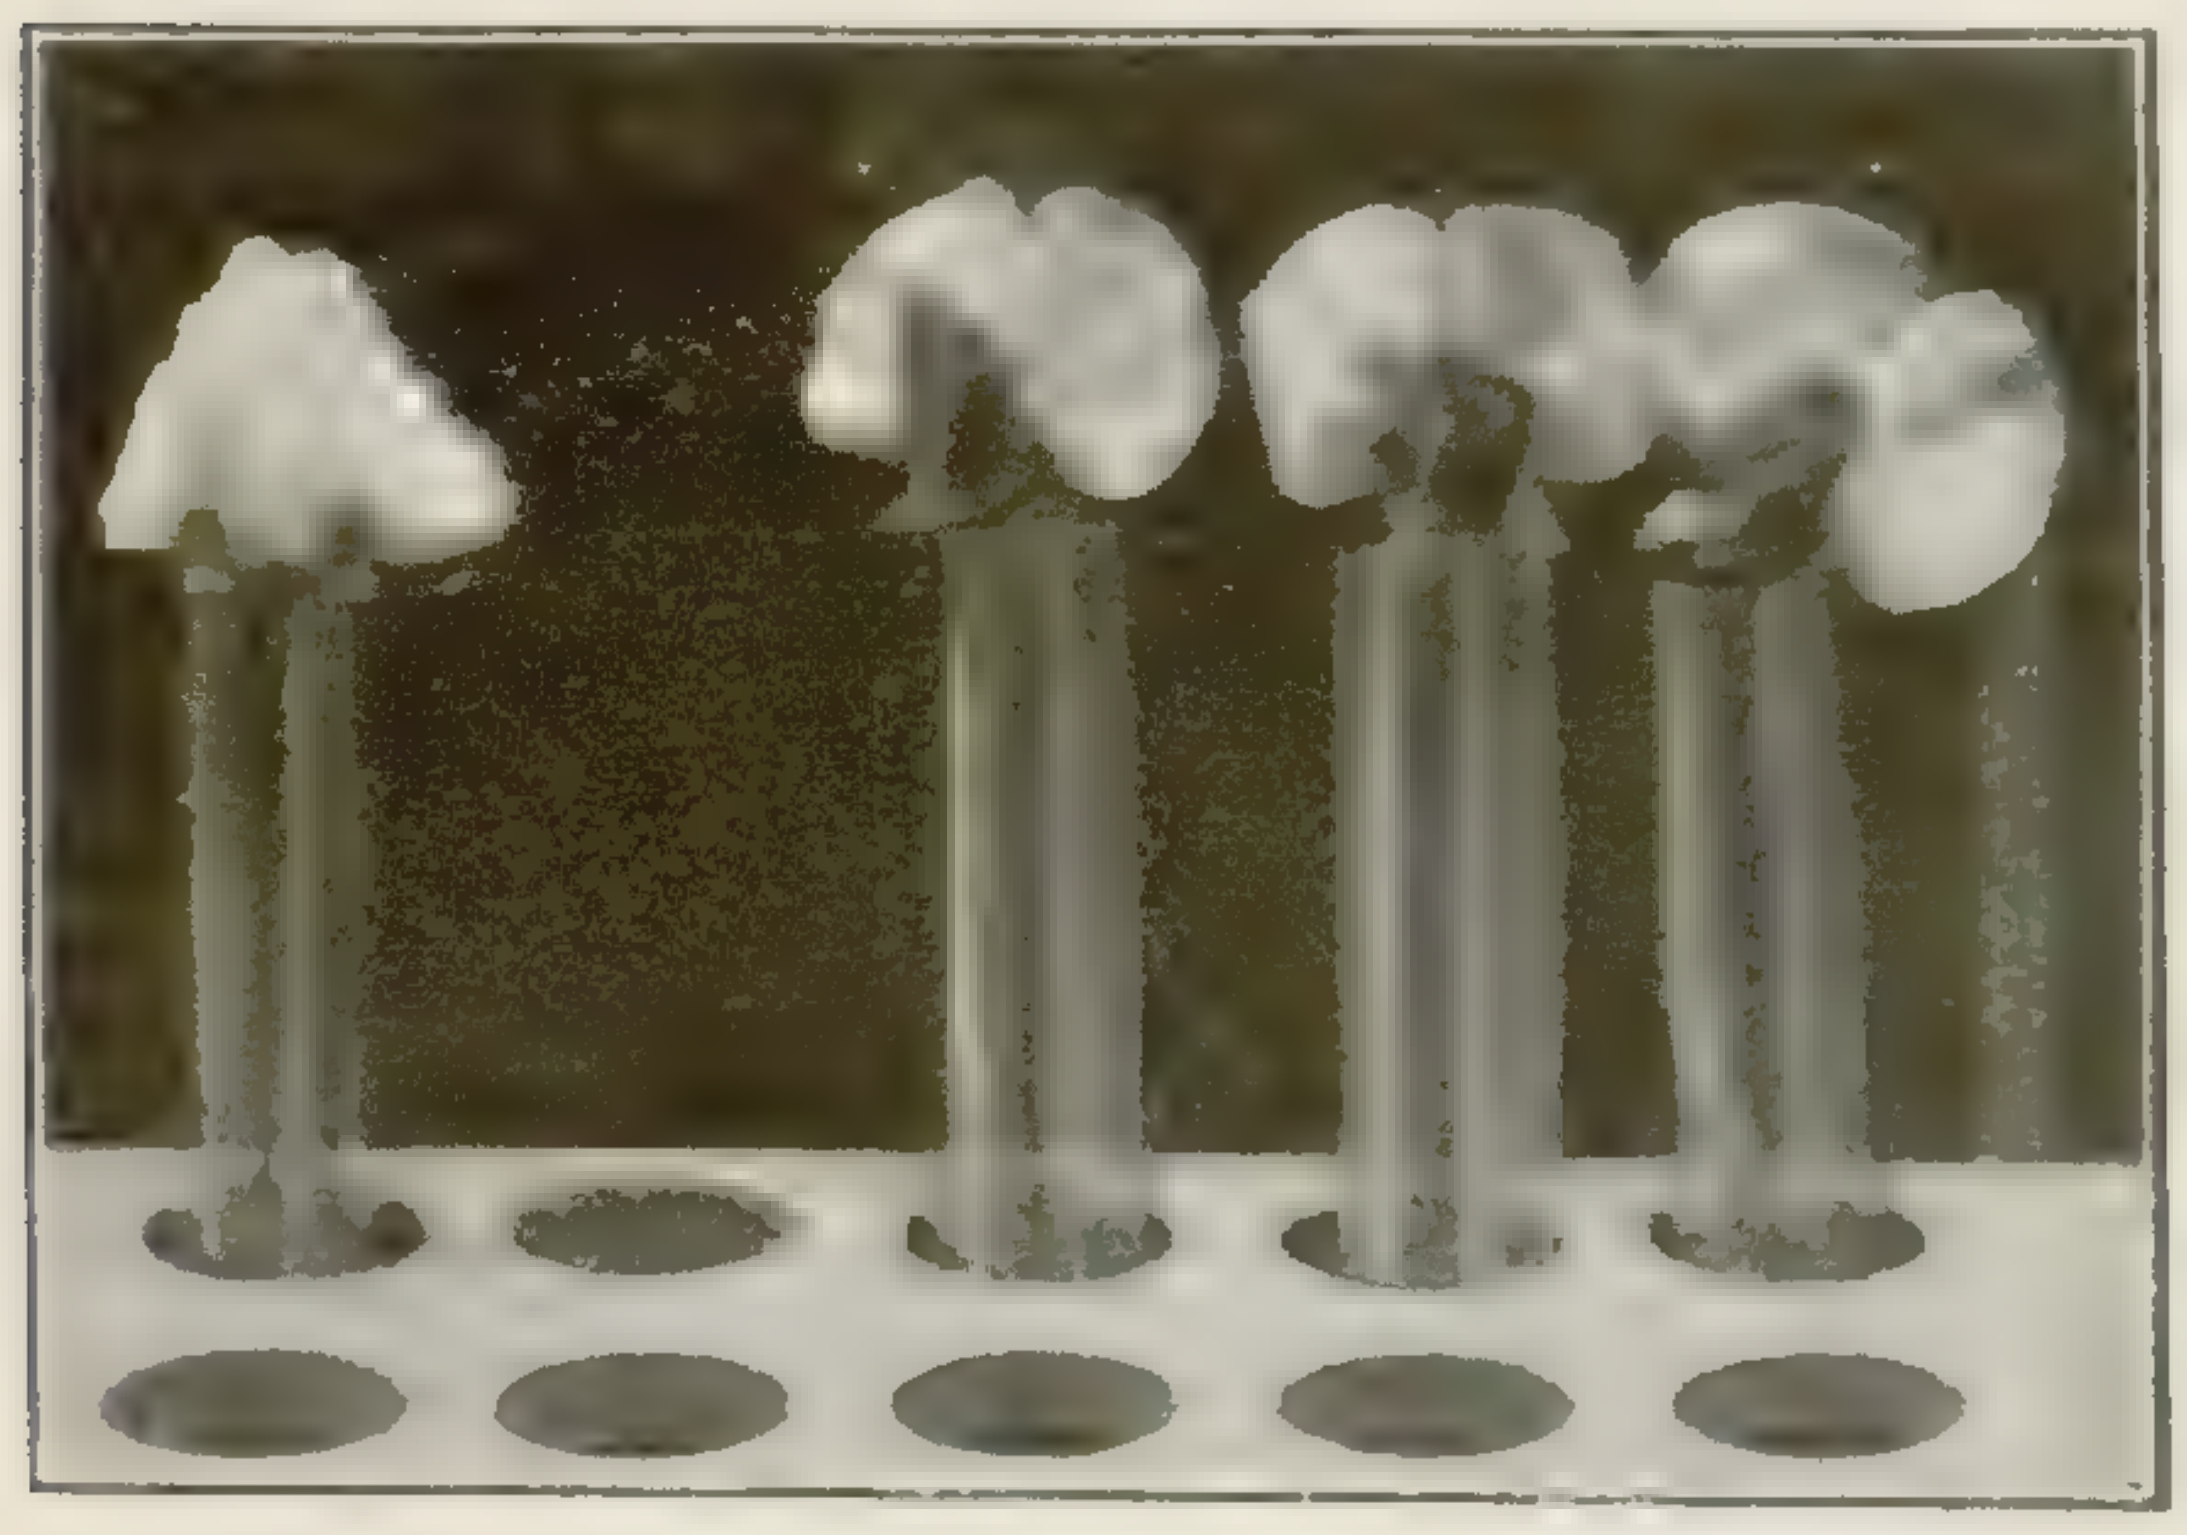


[Photo: International Publication Co.

VIEW IN BARON ROTHSCHILD'S WINTER GARDEN AT VIENNA.

RESULTS IN HYBRIDISATION OF PEAS.

Since the republication of Gregor Mendel's work on hybridisation of peas, in 1900, considerable attention has been given to the subject, and the object of this article is to give a short account of some experiments conducted at the Midland Agricultural and Dairy College. Before doing so, however, it will facilitate matters if the general characters of peas are given. With respect to the colour of the flowers, the cultivated garden varieties as a rule possess white flowers, but some two or three kinds grown in the fields, viz., Maple, Sand Pea, and Grey Jacks, have purple coloured petals.



MENDEL'S RATIO.
*Red flowers, 3 : White flowers, 1.

In respect to the length of haulm, though there is considerable difference in size of plants, it may be said that all varieties are either of tall or short habit. The difference between the two groups is gauged by the length of the internodes of the stem. A tall variety has greater intervals between the axils than a dwarf variety. For example:—

Talls.	Dwarfs.
Quite Content.	Harrison's Glory.
Gradus.	Best of All.
Centenary.	Excelsior.
Maple.	Glory of Devon.
Sand Pea.	Perpetual.

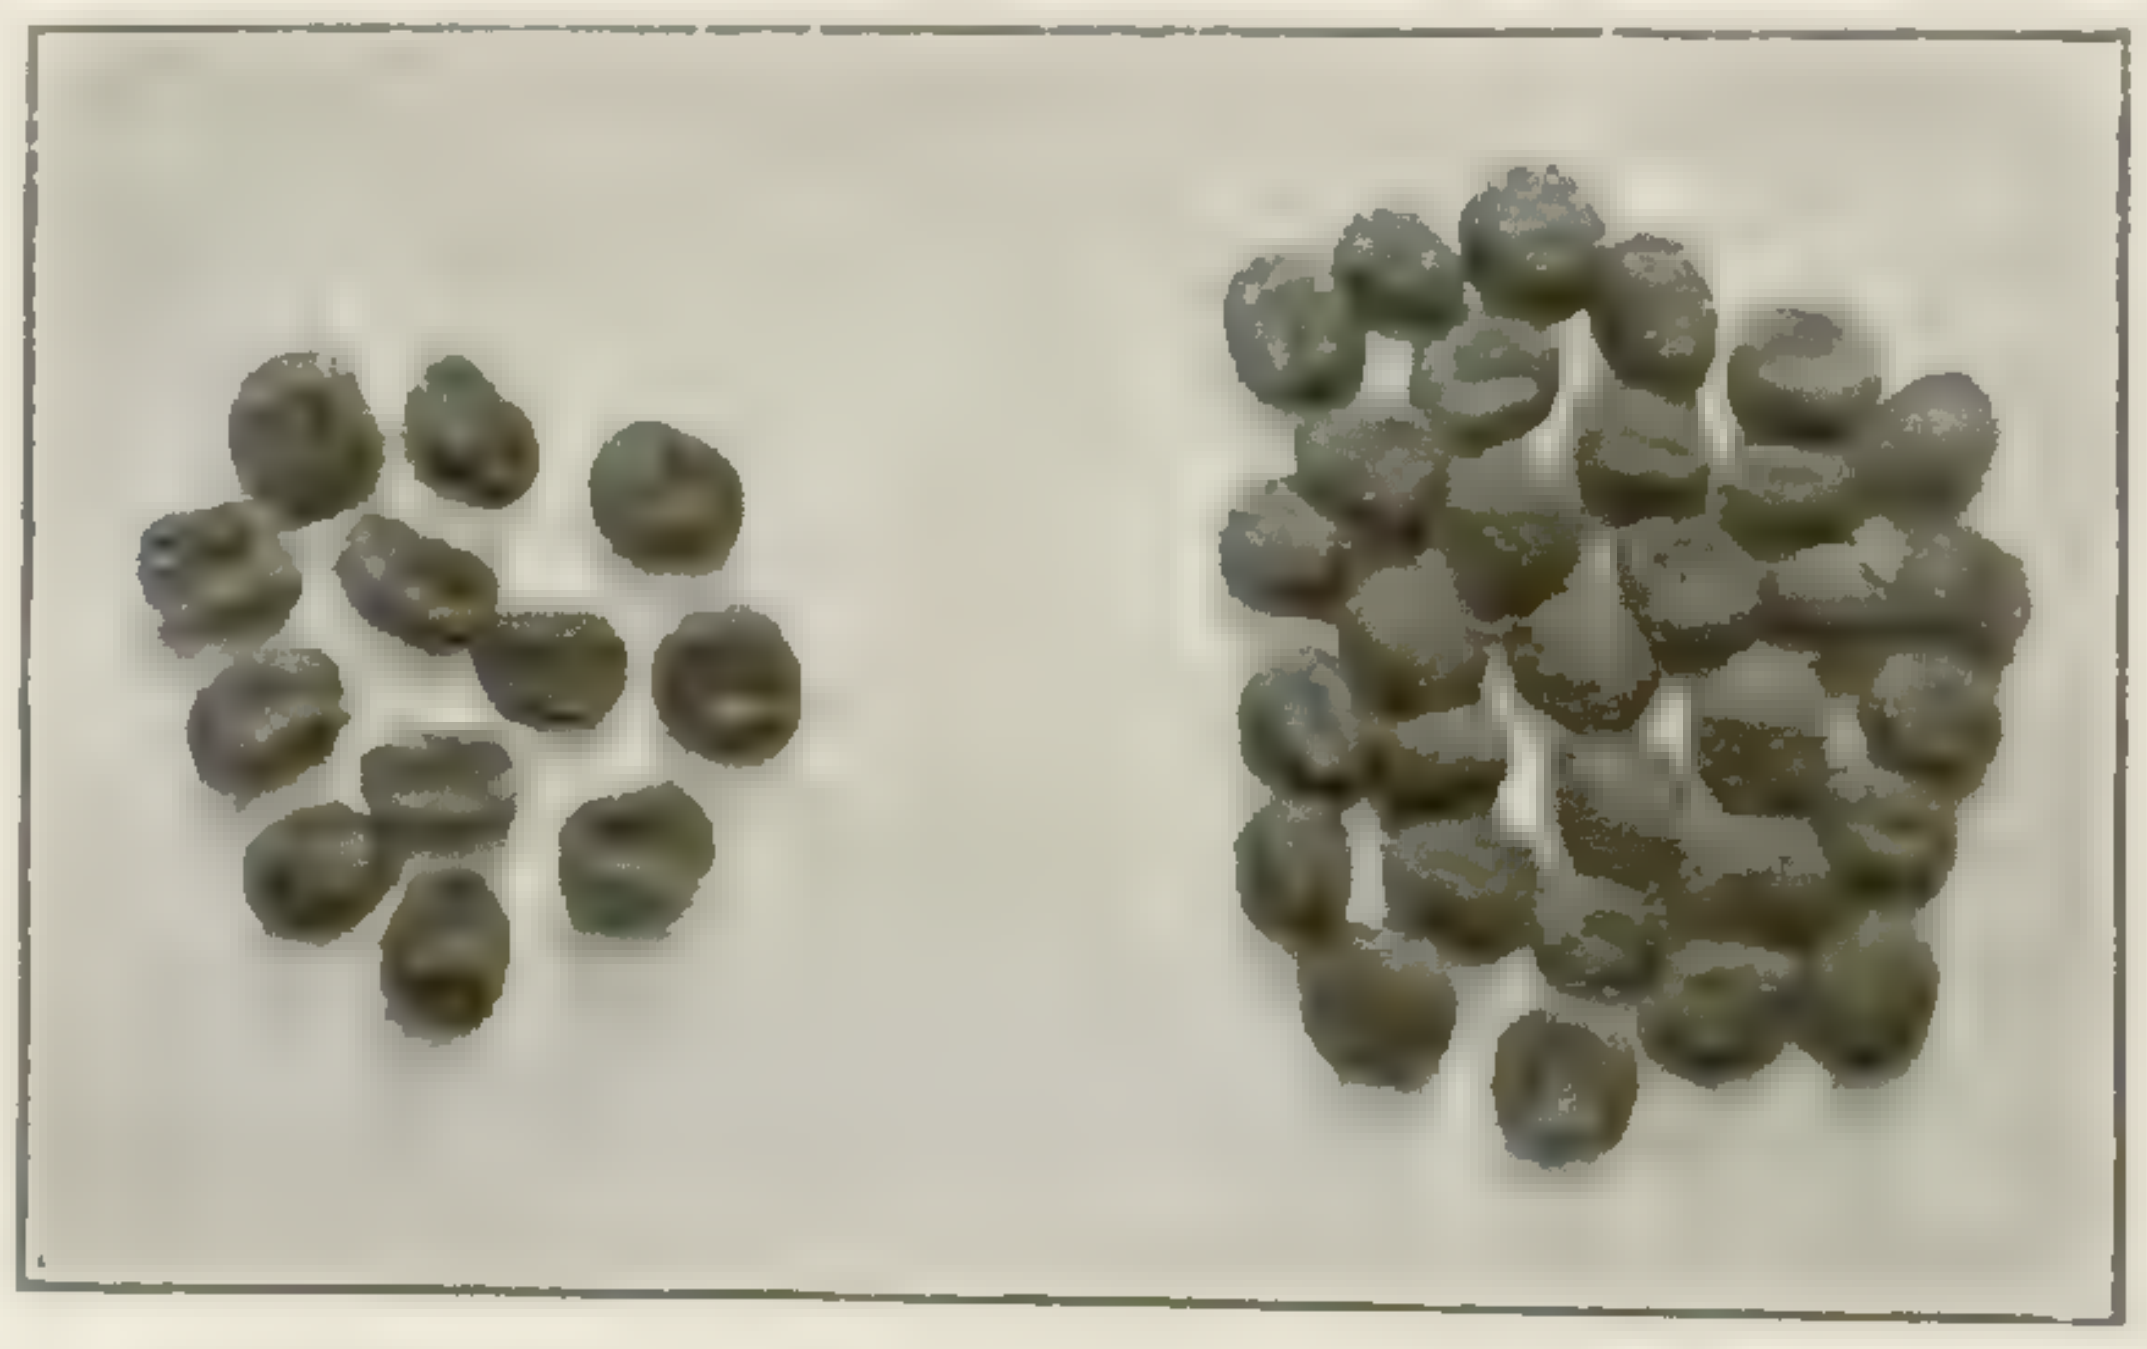
HARRISON'S GLORY × MAPLE CROSS (FOUR TYPES).
F2, short purple, short white, tall white, tall purple.

In regard to the shape of the seed, peas are round smooth seeds, or they are wrinkled. This latter quality pertains on drying, and is especially seen amongst the marrowfat (sweet) varieties, whilst the former shape is more often seen in the so-called field sorts; examples: Round—Harrison's Glory and Sand Pea; wrinkled—Gradus and Gladstone.

Great variety is exhibited in the colour of the seed coat. Green (blue), white, and mottled seem to be the more pronounced, but there are intermediates between the different grades, and the colour to some extent depends upon the colour of the interior of the peas, as examples: Blue—Best of all; mottled—Maple; white—Charlton. Exposure to light tends to bleach away the colour, so that a blue variety of pea may appear almost white.

In addition to the foregoing colours, there is purple spotting of the seed coat, which is confined to purple-flowered kinds. This peculiarity is not constant, and may be absent altogether, whilst in extreme cases the colour may be diffused, causing the seed to appear blood red. Again, on the same plant the spots may be fewer in number on some specimens, or almost invisible. Example: Grey Jacks.

With respect to the cotyledonary colour. On stripping off the testa or seed coat the colour of the interior, or flesh of the seed, is exposed. Yellow and green are the two prevailing colours, and it is interesting to mention that white peas are yellow inside, whereas blue ones are green, as examples: Yellow—Gradus, Maple, Sand Pea; green—Harrison's Glory, Best of All, Centenary. In many of the garden peas now in the trade the seeds are not true in this respect. In bulk they have some with yellow, and others with green cotyledons.



HARRISON'S GLORY × GRADUS.
(Seed from one plant.)
A sporting type from above cross.
Ratio, 31:12.

In the matter of the shape of pods the differential characters are not so clear though it is possible to arrange the pods under two or three groups. Some possess a distinct prolonged- pointed—legume, in others the curvature is more abrupt on the dorsal terminal extremity of the pod. Another class falls quite intermediate between these two shapes, but is readily distinguished, and is constant to the variety producing it. Pointed—Gradus, Centenary, Quite Content; blunt- Excelsior, Maple, Autocrat: intermediate Harrison's Glory.

The colour of the hilum is of interest, for on close inspection of field varieties, particularly those with red flowers, one finds seeds with a black scar or hilum. This property is also common to some sorts of broad beans. The hilum may not be black on all the seeds of any particular variety, but is constant on any plant which exhibits it. The colour appears on the seed ripening, and is probably due to some oxidisable pigment in the corky layer of the scar which occurs at the juncture of the funicle and the seed.

Having set out the chief characters of the different kinds, it is left to consider their behaviour when combination of them is brought about by crossing. According to Mendel, and others, the following list sets forth the dominant and recessive characters:—

Dominant.	Recessive.
(a) Red or purple flowers.	White flowers.
(b) Tall habit.	Dwarf habit.
(c) Round shape.	Wrinkled shape.
(d) Yellow cotyledons.	Green cotyledons.
(e) Mottled seed coat.	Plain seed coat.
(f) White seed.	Green (blue) seed.

These have been verified by experiments as the following crosses will show:—

(a) Purple flowers dominant over white flowers.

Purple Flowers.		White Flowers.
Maple	×	Gradus.
Maple	×	Harrison's Glory.
Maple	×	Autocrat.
Sand Pea	×	Perpetual.

† SAND PEA × PERPETUAL.
Purple Spots.

F1, the crosses produced are purple flowers.
*F2, the next generation sported white flowers in minority.

(b) Tall habit dominant over dwarf habit.

Dwarf Habit.		Tall Habit.
Harrison's Glory	×	Gradus (pollen).
Harrison's Glory	×	Maple ,,
Perpetual	×	Sand Pea ,,

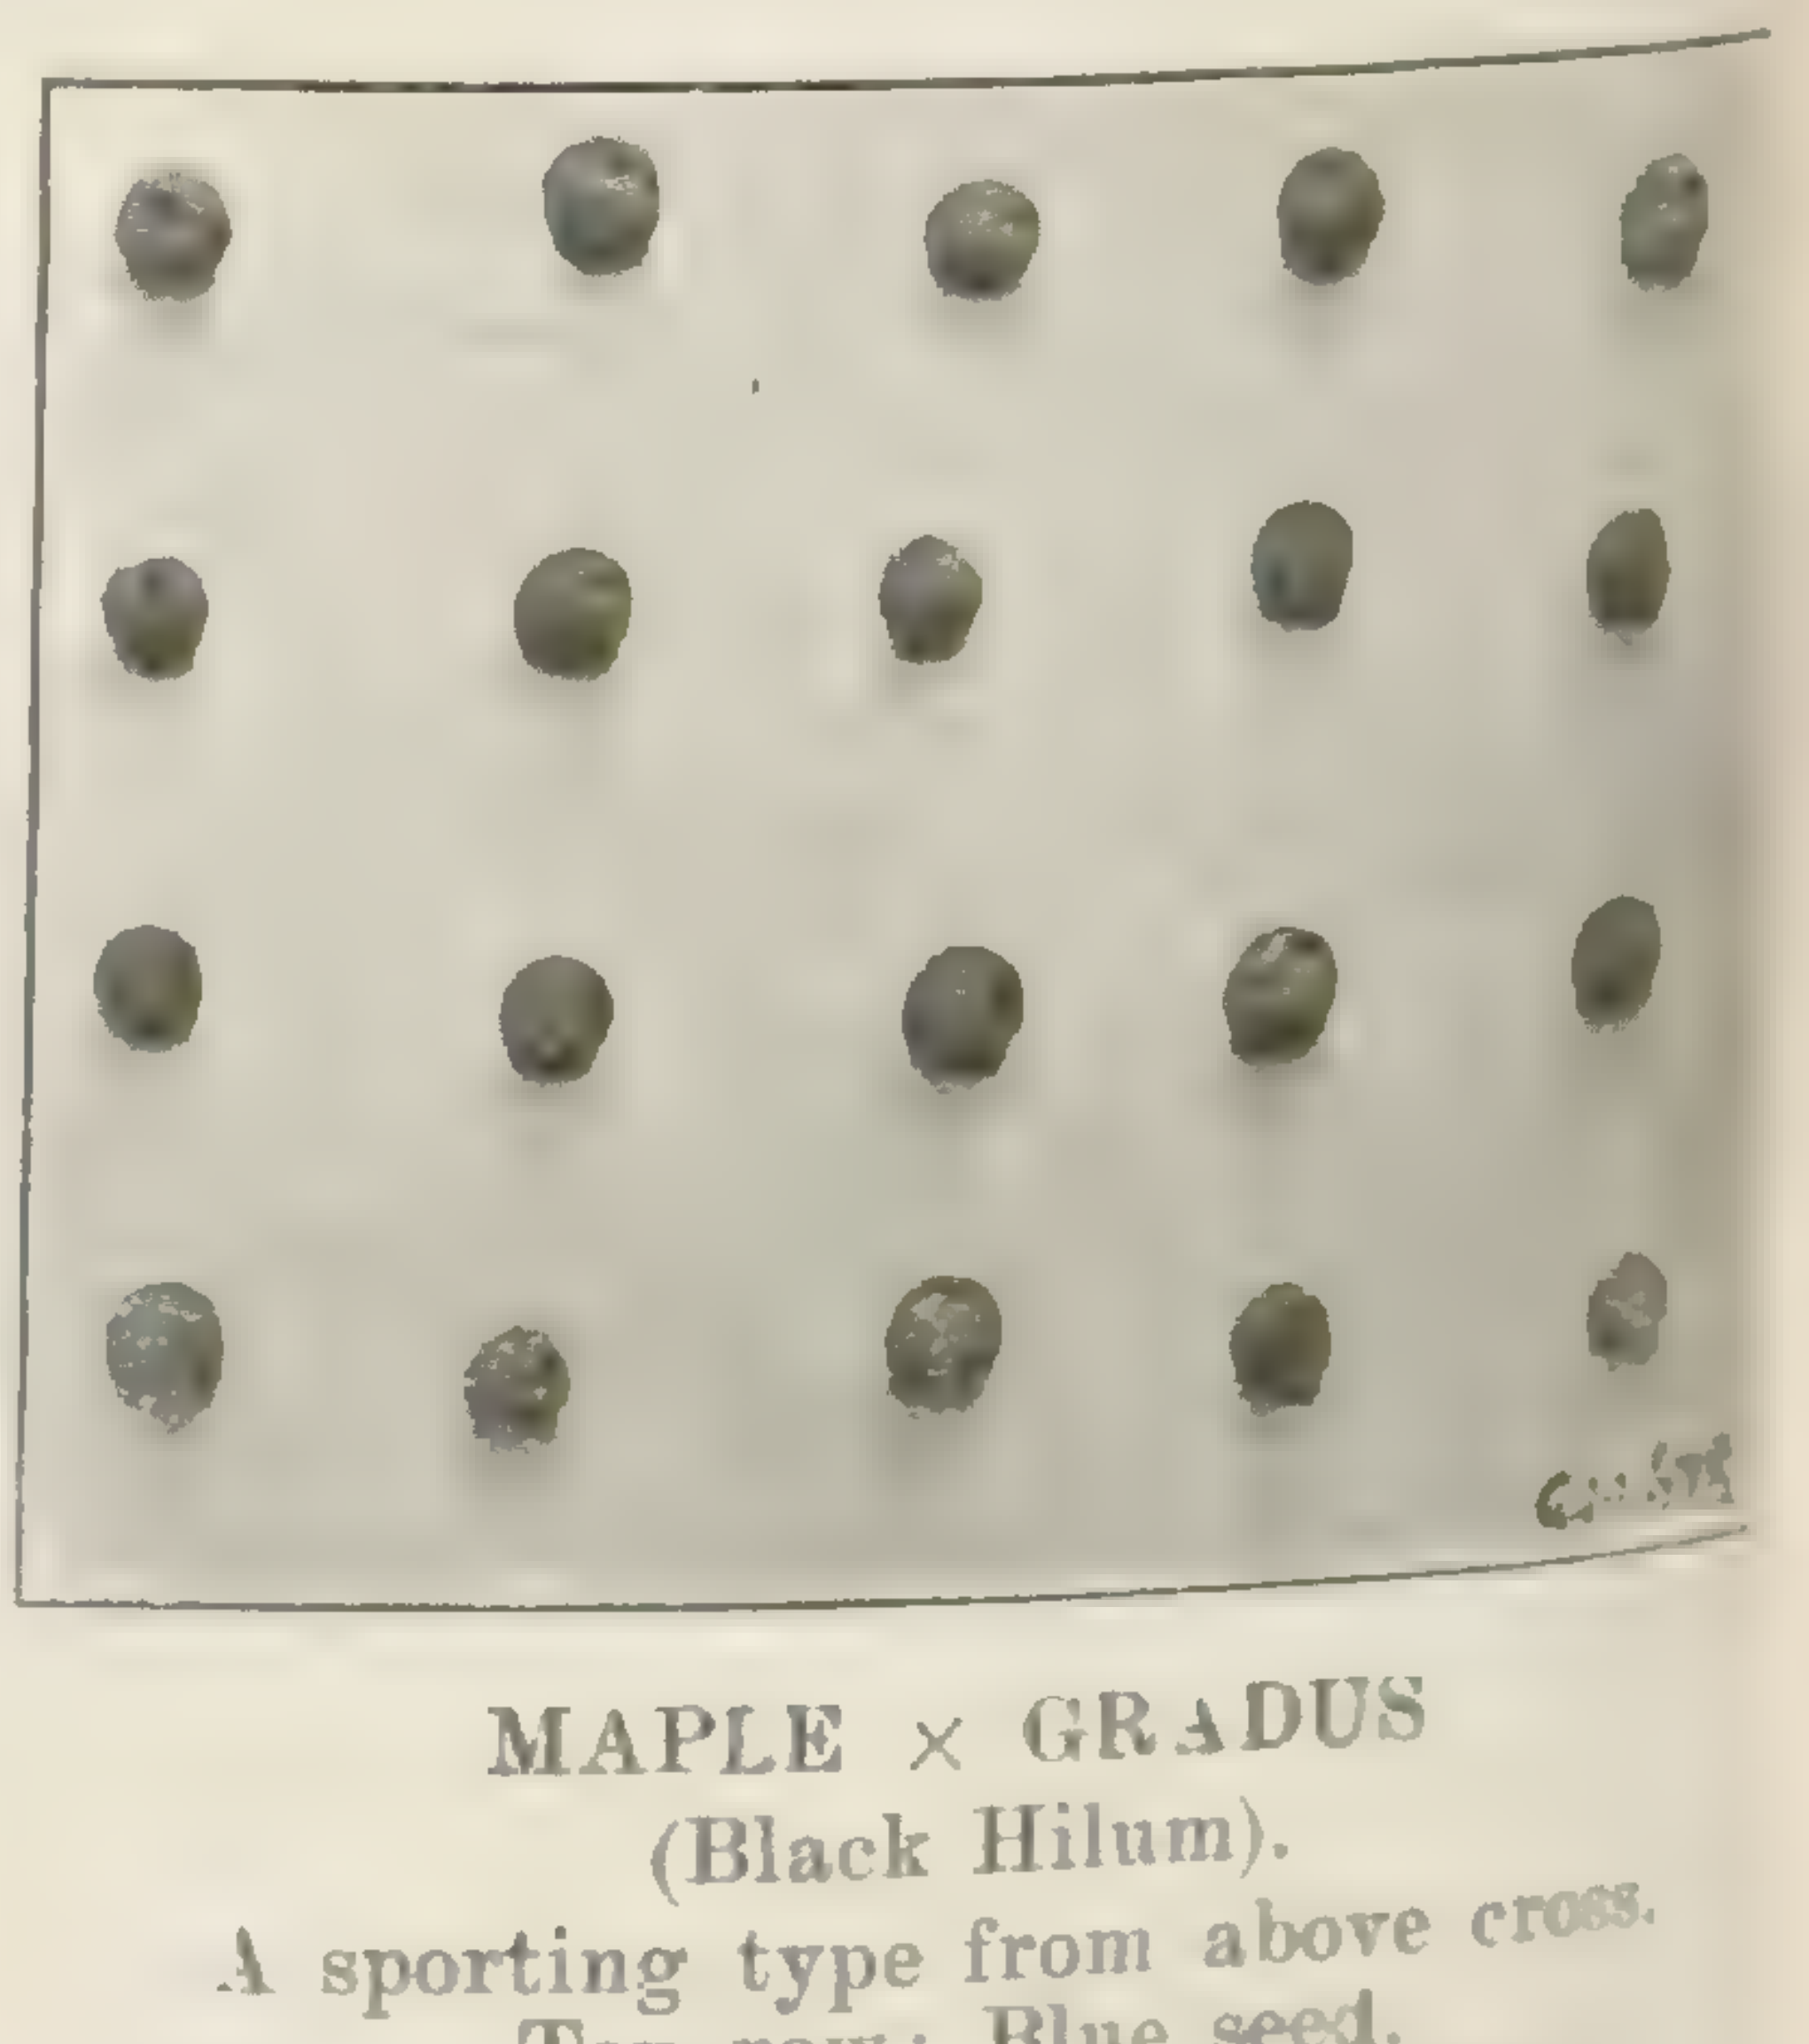
F1, the crosses produced are tall plants.
F2, the next generation sported shorts in minority.

Harrison's Glory	×	Centenary (pollen).
Excelsior	×	Gradus ,,
Perpetual	×	Centenary ,,

F1, the crosses of 1907 produced all tall plants in 1908.

(c) Round seed dominant over wrinkled seed.

Round Seed.		Wrinkled Seed.
Harrison's Glory	×	Best of All.
Harrison's Glory	×	Centenary.
Harrison's Glory	×	Perpetual.
Harrison's Glory	×	Glory of Devon.



MAPLE × GRADUS
(Black Hilum).
A sporting type from above cross.
Top row: Blue seed.
Next three rows: White seed.
All possessing the black hilum.

F1, the crosses of 1907 gave round wrinkled peas in the same pods of 19

In the above crosses the peas from two plants of each were counted as follows:—
Total 8 plants—round, 53: wrinkled, 17.

Harrison's Glory	×	Gradus.
Maple	×	Gradus.
Sand Pea	×	Perpetual.

F1, sported wrinkled in minority.

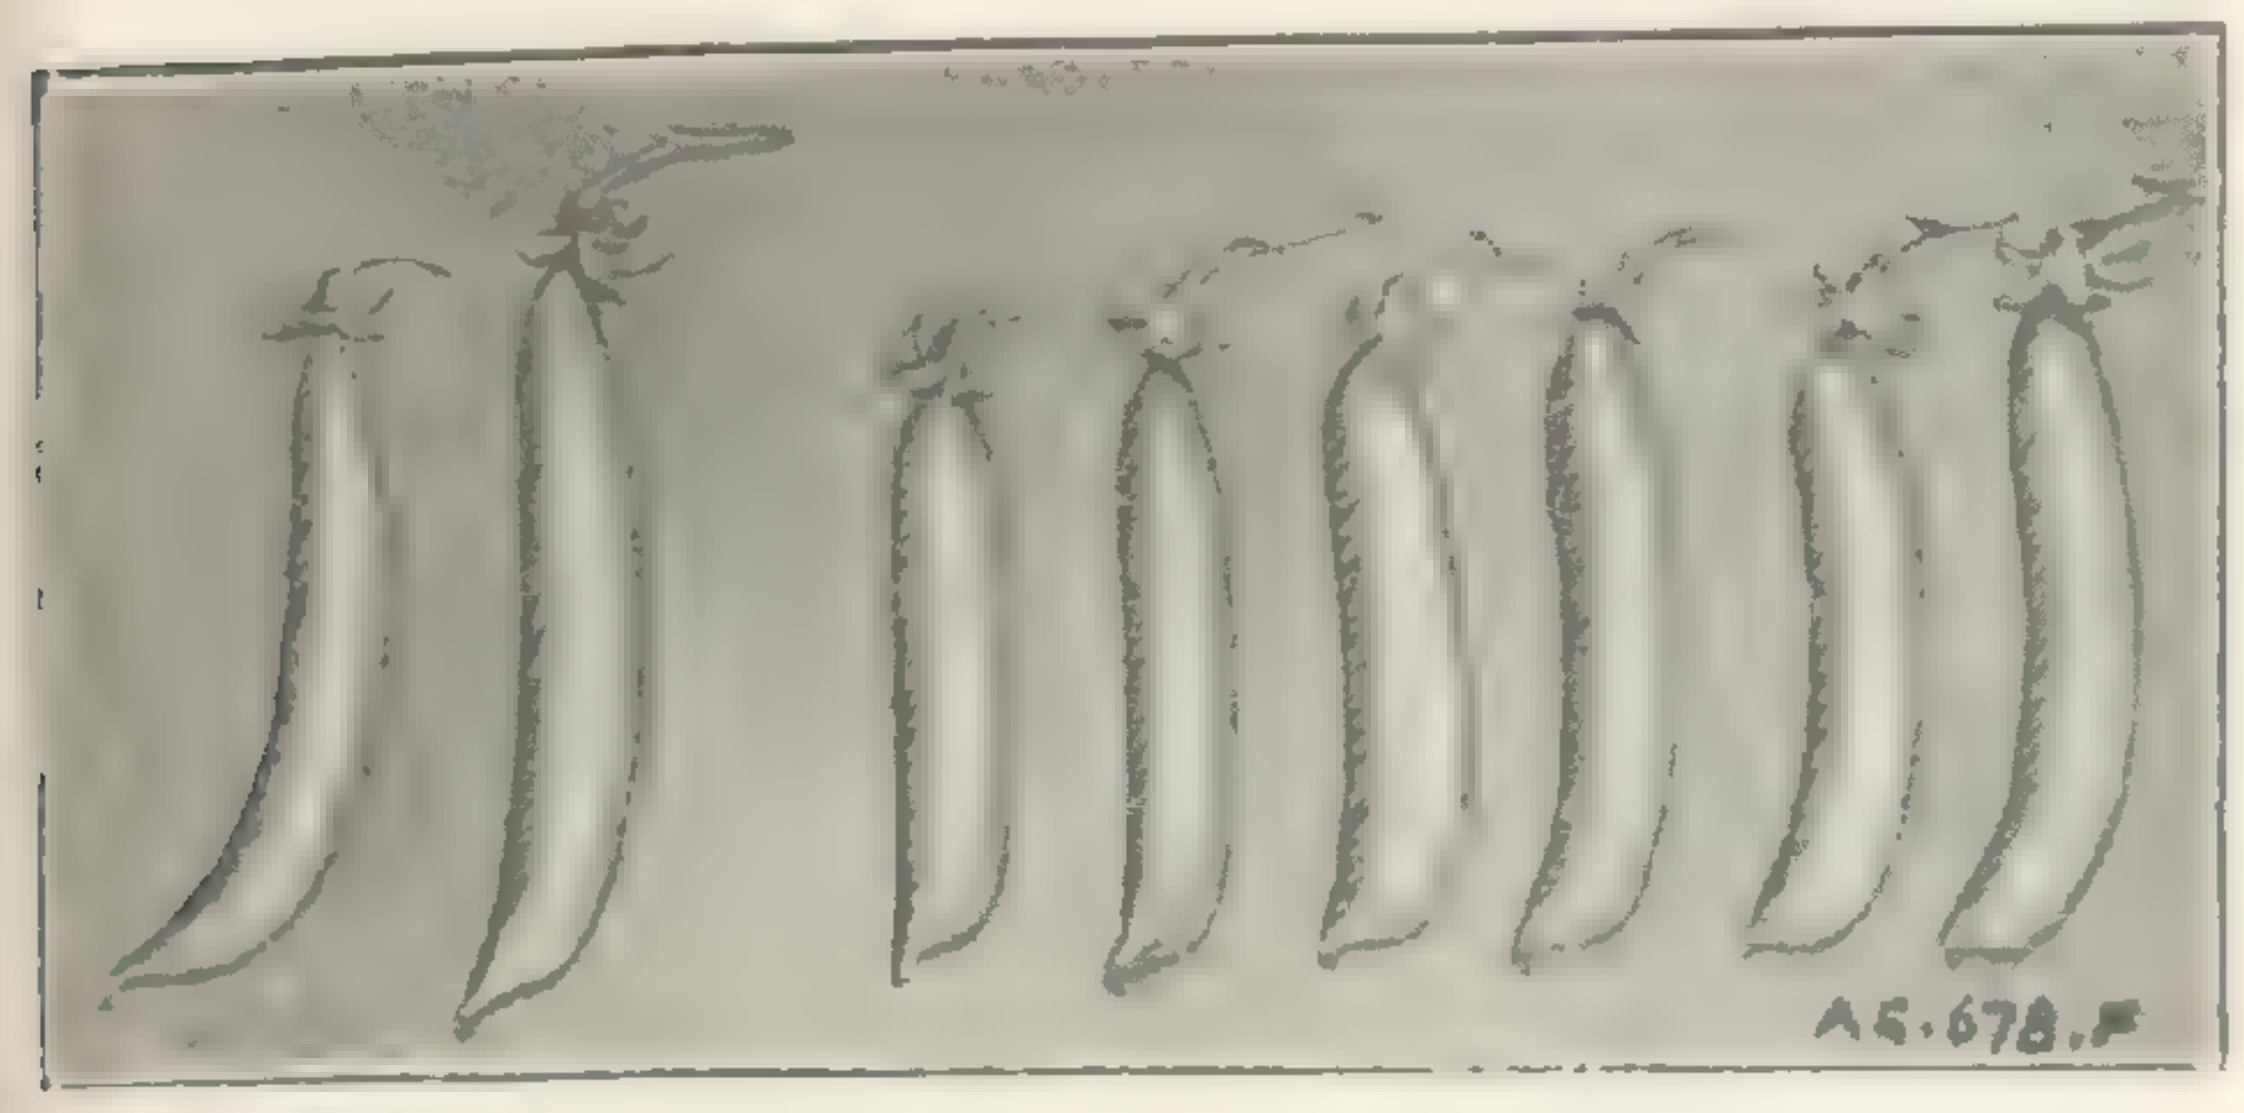
(d) Yellow cotyledons dominant over green cotyledons.

Yellow cotyledons.		Green cotyledons.
Maple	×	Harrison's Glory.
Gradus	×	Harrison's Glory.
Perpetual	×	Harrison's Glory.
Perpetual	×	Centenary.

F1, the crosses sported green cotyledons in minority.

When Harrison's Glory was the mother plant pollinating changed the cotyledons of the seed to yellow.

(e) Mottled testa dominant over plain testa, and white dominant over blue.



SAND PEA AND PERPETUAL.
Pods from different plants of the F2 generation (drawing).

Mottled.		Plain.
Maple	×	Gradus.
Maple	×	Harrison's Glory.
Maple	×	Autocrat.

F2, sported plain in minority.

(f) White.		Blue.
Gradus	×	Harrison's Glory.
Perpetual	×	Harrison's Glory.

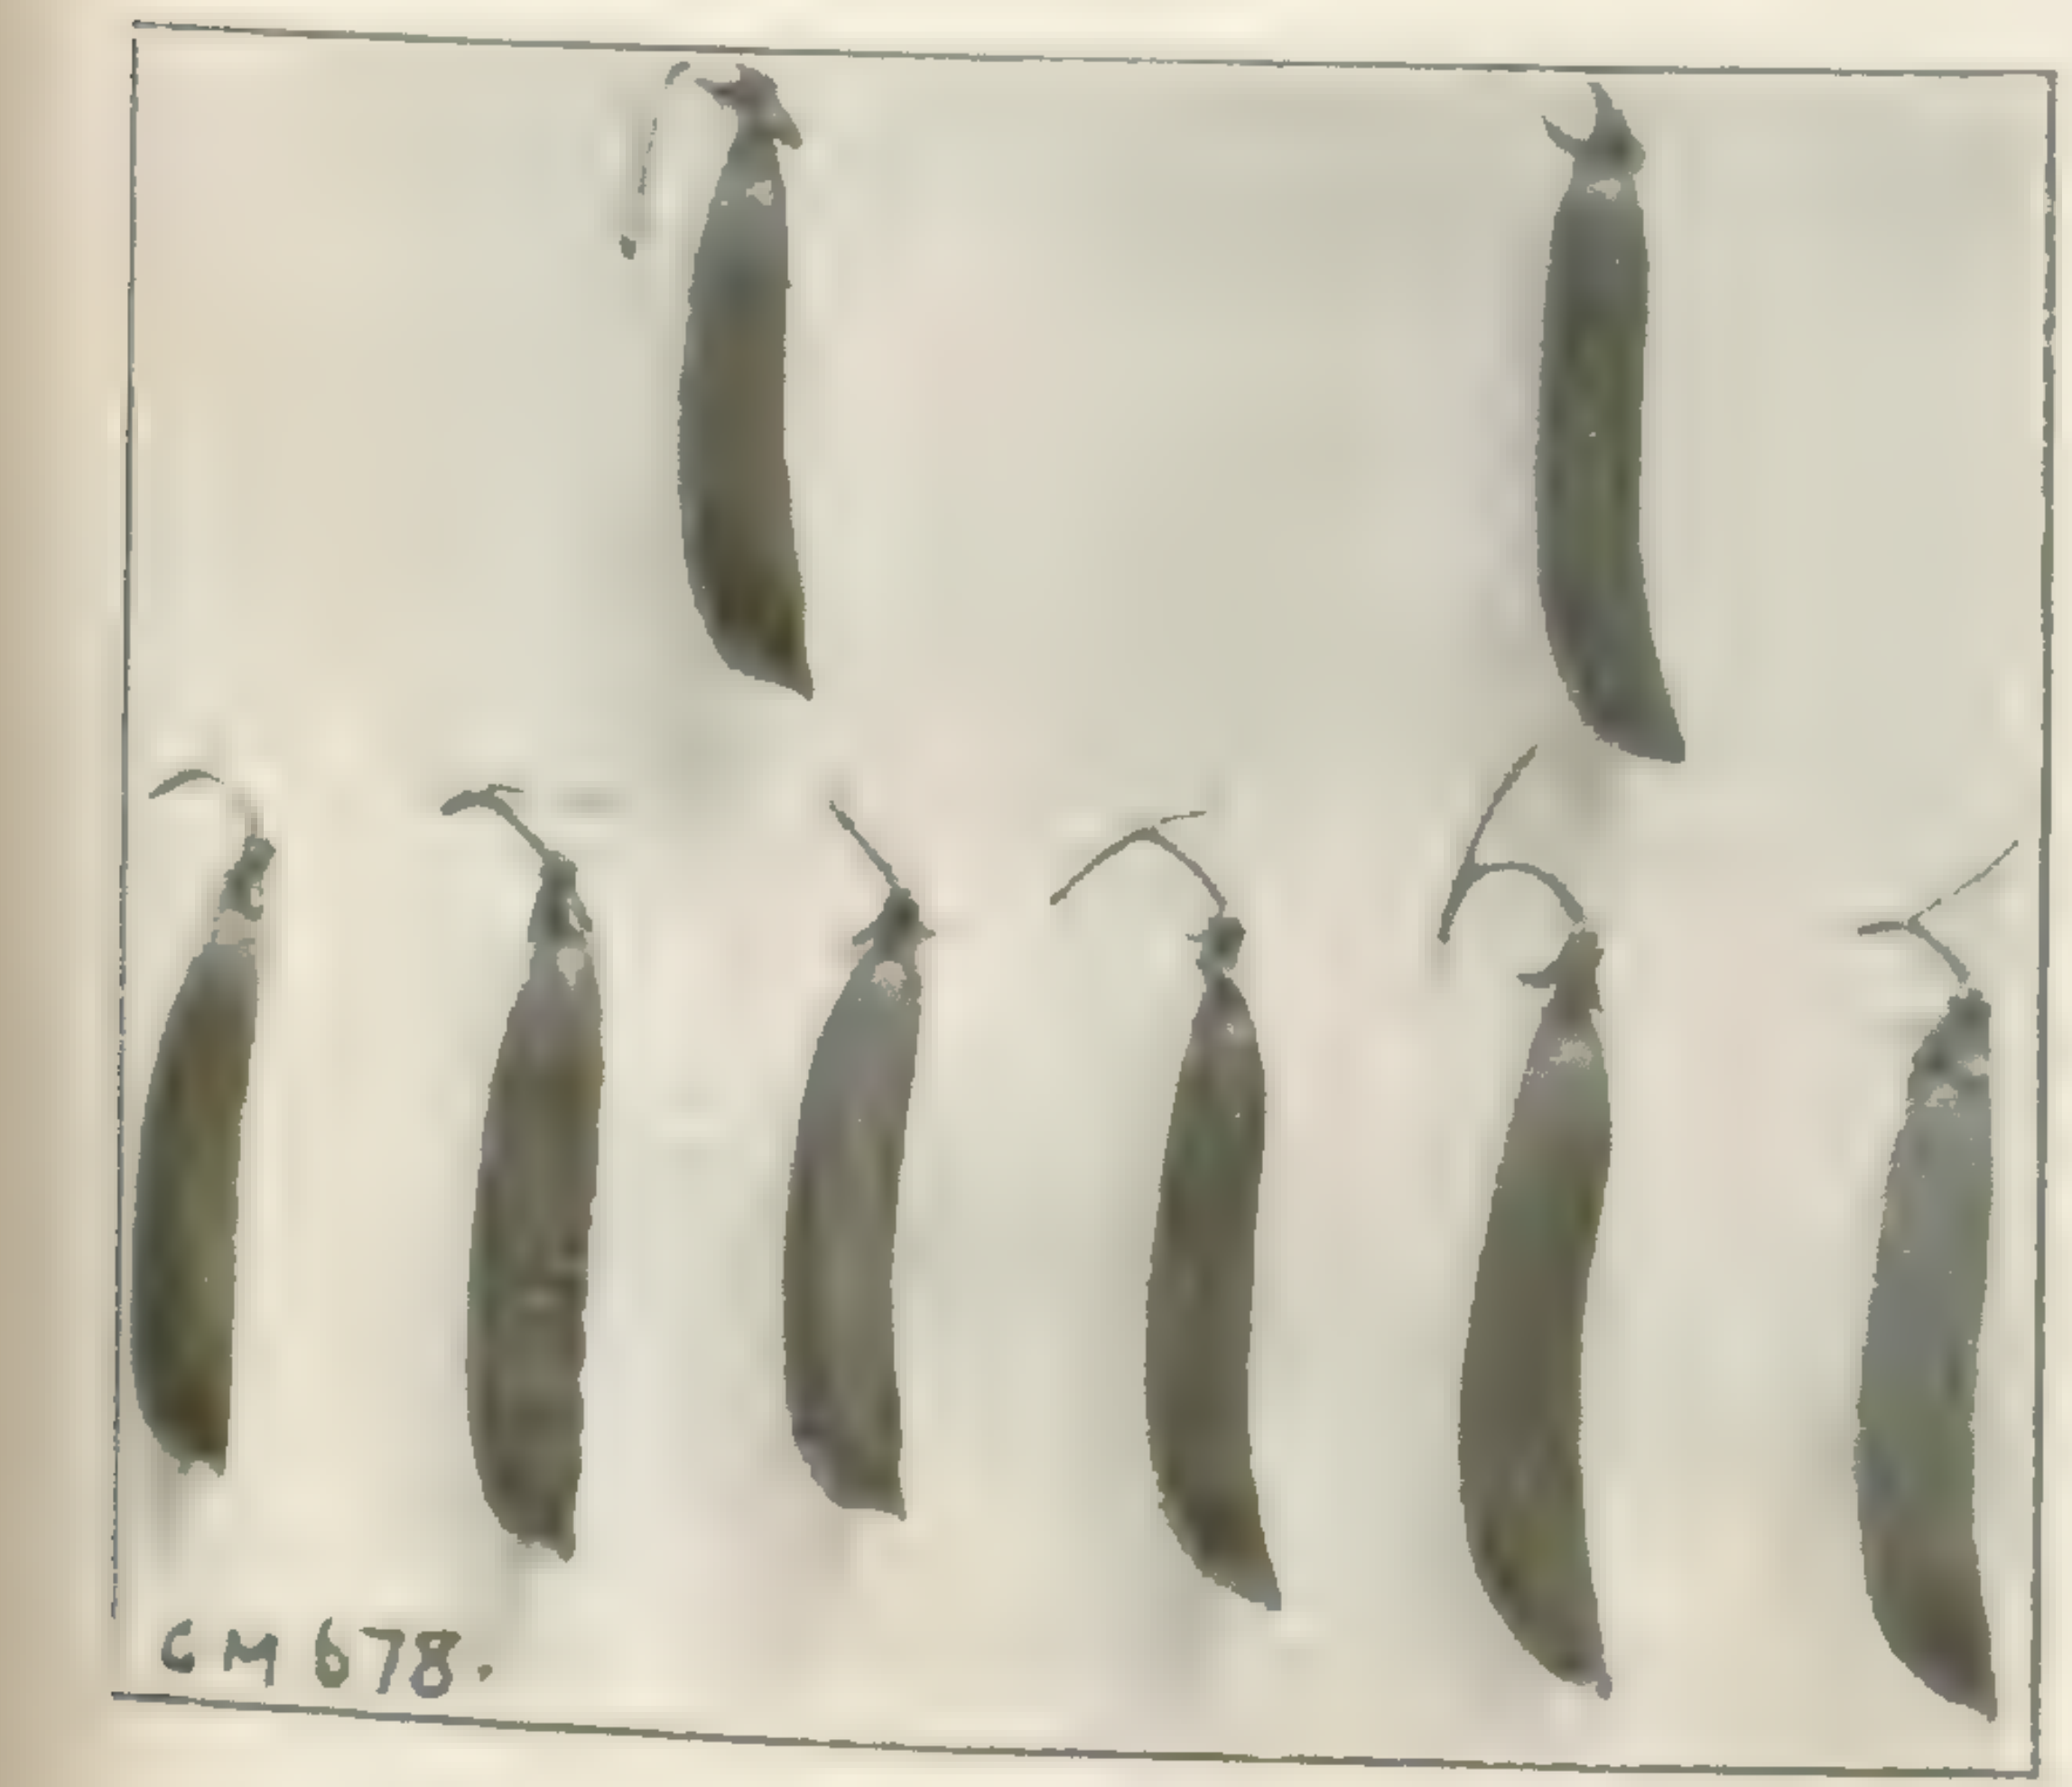
F1, sported blues in minority.

Purple spotting of seed. It has been found that crossing purple flowers with white ones induces purple spotting on the seed of the F2 generation.

Examples:

Maple	×	Autocrat.
Maple	×	Harrison's Glory.
Maple	×	Gradus.
† Sand Pea	×	Perpetual.

F2, purple spotting, though not uniformly constant, appears in the majority.



‡ HARRISON'S GLORY × GRADUS PARENTS.
Six distinct types (two kinds of pods).

In addition to the above, other points have been investigated. First, the black hilum observed on some seeds of purple-coloured flowers appears to be a dominant character, and is quite separable from mottling of seed and colour of the flower. In the undermentioned crosses this mark has been found to continue on both white and blue seeds resulting sports of the F2 generation.

Black Hilum—Present.	Absent.
Maple (some)	Harrison's Glory.
Maple ,,	Gradus.
Maple ,,	Autocrat.

F1, possessed the black hilum and sports in the F2 generation.

Secondly the shape of the pod to some extent obeys the same laws.

Blunt pods dominant over pointed pods.

Blunt.		Narrow.
Sand Pea	×	Perpetual.
Maple	×	Gradus.

F2, produced sports narrow pointed pods in minority (1908). See above.

‡ Harrison's Glory	×	Gradus.
Harrison's Glory	×	Maple.

F1, produces the two shapes of pod as seen in the parents.

It may be noted, too, that when two narrow-podded parents were brought together the F1 generation produced similar pods. Example: Perpetual x Centenary (F1 grown in 1908).

Again, when two blunt-podded parents were crossed, Partridge x Autocrat, all the sporting types, both red and white flowers, carried pods like the parents.

In conclusion, it may be stated that these results have been given to emphasise the use of factors in plant breeding.

Where peas are concerned we now know several of the recessive characters, and a plant exhibiting a recessive character does not sport in that direction.

PODS FROM SIX SPORTING PLANTS.

This knowledge, in the hands of the hybridiser, is a most useful lever, rendering the work of plant breeding less uncertain than it has been in the past.

Fred Wakerley, M.Sc., F.H.A.S.
Kingston-on-Soar, Derby.

ASPERULA HEXAPHYLLA.

A border plant of considerable merit, yet one which has never had its value sufficiently recognised is Asperula hexaphylla, the Five-leaved Woodruff, a native of Italy and Hungary. It has been in cultivation for a considerable time, and was first brought under my notice some years ago by a hardy plantsman of great experience, as a hardy plant of graceful growth, giving elegant flowers for cutting, and excellent for growing in a shady border. This it proved to be, and I found it an acquisition of real merit for certain purposes. Its narrow leaves are arranged in whorls, generally numbering five in each, and it gives a cloud of little white flowers, like those of the little common woodruff, but valuable for such purposes as sprays of Gypsophila paniculata frequently fulfil among other blossoms. This asperula grows to about a foot high, and prefers shade to sun, while it does not like a very dry, but prefers a rather moist border in common soil. It is increased by division, and looks elegant in summer with its small flowers and its graceful leaves.

S. Arnott.

EARLY PHLOXES AMONG ROSES.

The early phloxes of summer, as distinct from the small-growing spring phloxes of the type of P. subulata, etc., do not appear to grow so much in favour as they should do. An excellent use has been made of small plants of these by planting them in spring in rose beds, although the enthusiastic lover of the Queen of Flowers will probably view the statement with some cavilling. Of course, if large plants were employed, there would be a danger of their robbing the soil for the roses, but small plants, such as can be purchased from the nurserymen in spring, will not do any harm to the roses, and will add beauty to the bed at a time when it is most required.

There are some very beautiful things among this early-flowering section of phloxes, and such varieties as the sweet-scented Lady Napier, of purest white; that beautiful variety, Mrs. Forbes, also white; Alliance, rosy-cerise; Mrs. Miller, reddish-purple; General Roberts, white, crimson eye; the lovely snowy Snowflake; The Queen, soft pink, and many more might be mentioned as splendid for our purpose. It must be remembered that these young plants give much finer spikes and flowers than do old ones, and when autumn comes they can be divided again, so as to prevent them from encroaching upon the food of the roses. They delight in the good soil and fat feeding of the rose, and will thus thrive splendidly in the same beds as it.

Young plants of this early-flowering section of phloxes, which is called the Suffruticosa one, are procurable from most dealers in hardy flowers, and if the selection is left to them, good plants can be secured at a lower price than otherwise.

S. A.

WINTER HELIOTROPE.

Among our very few outdoor winter flowers there are at least three which are sweet-scented, which is a very good proportion, better perhaps than at any other season of the year. Petasites fragrans is well-named Winter Heliotrope, as it is very much like the heliotrope in scent and only a shade or two paler in colour. It is admirably adapted for a clay soil of the wettest description, and I think it was in Mrs. Earle's "Pot Pourri of a Surrey Garden" that the authoress lamented that she was not able to grow this sweet-scented flower because of the sandy character of her soil. But, as with the Bindweed, we must be very careful where we plant it, as it spreads underneath the soil only less insidiously than that plant, and therefore it should never be planted near choice shrubs, or within reach of the roots of fruit trees. I grow it in an angle where two walls meet, the base of the triangle being the gravel path, and there it is pretty safe. It will grow where the sun never shines, and the ideal place for it is on wet clay banks by ponds or streams.

The foliage is not without beauty and makes a good carpet to the ground in wild or waste places, often through the winter, though severe frost cuts it off as black as a dahlia. It begins to bloom in a favourable season by the end of November. Its correct name, Petasites is from a Greek word meaning a covering for the head, owing to the size of the leaves of our native butter-burs (P. vulgaris). The name Tussilago, sometimes used, is only properly applied to our wild Colt's foot, and is derived from the Latin tussis, a cough, owing to the use of that plant as a remedy for coughs—a custom still not extinct.

Alger Petts.

COOL ORCHIDS.

The following contribution to the "Memoirs" of the Royal Caledonian Horticultural Society, by Mr. R. Brooman White, of Arddarroch, Garelochhead, is of special interest for the unquestionable evidence it affords of the facility with which cool orchids may be grown in gardens of quite moderate dimensions:

"I cannot afford to grow orchids," is a remark which has become so hackneyed that were I to retort, "There are many orchids which can be grown as cheaply as geraniums, or, at any rate, as cheaply as ordinary stove-house plants," many of my readers would be sceptical. Yet such is the case; and to prove that it is so, the matter only requires to be put to the test.

Among cool orchids, Odontoglossum crispum, the "Alexandra" orchid of common parlance, the easiest to grow and flower of the whole genus, takes first place. As applied to these plants, the term "cool" implies that they come from high altitudes; and when it is mentioned that in the Colombian Andes they grow up to an elevation of 12,000 feet above sea-level, the significance of the term will be fully appreciated.

The requirements of a cool orchid like Odontoglossum crispum (and for my purpose I will include under the term "crispum" not only the species of that name, with its hybrids and varieties, but such allied species as triumphans, gloriosum, etc.), are briefly these: (a) A light, airy house that can be well ventilated, and kept damp at will. Though they will grow in almost any locality, in Scotland at any rate, except perhaps in some hot situations, an independent house with span roof, walls to the roof (i.e., without glass sides), and top and bottom ventilators is to be preferred. (b) A tank or tub in which to keep water at the same temperature as that of the house. As a regulation minimum, a temperature of 50 degrees should be aimed at, though in very cold weather, when it would be difficult to maintain this, a temperature as low as 45 degrees will not hurt the plants, if they are kept proportionately dry at the roots at the same time. In the hottest weather the temperature of the house should never exceed 75 degrees if possible, though, if the plants are kept wet, a higher temperature occasionally will do no harm. Modifications of this temperature, according to weather and other conditions, will, however, soon suggest themselves to the thoughtful would-be grower of crispums. (c) The house should be shaded by a blind of cotton shading or laths, made so that it can be easily rolled up and down at will.

The plants can be purchased from the importers, or at auction sales of imported plants, at from 1s. to 5s. and upwards each, according to size. For the tyro in crispum growing it is better, perhaps, to begin with plants at 2s. 6d., and to continue with these for a while, as they will be better subjects to work upon than any of the other sizes. From amongst imported plants all the most valuable forms of Odontoglossum crispum which have appeared from time to time, and which have created such sensations in the orchid world, and in the press, have been obtained. When the plants are gathered from the trees they are dried in order that they may withstand the journey through the hotter parts of the country at lower levels, and across the ocean; and when they arrive here all that is necessary is to resuscitate them. This is done by laying the plants on tiles, or stage battens, with a little moisture-retaining material, and syringing them, great care being taken not to give too much water at a time till they begin to "plump up." They will then produce roots and growth from the "lead," which is the last-made pseudo-bulb, and they should then be potted.

As a general rule, the more porous the pots the better will the plants grow, though this has been proved not to be an inexorable rule by an English grower who has introduced glass pots with excellent results in the cultivation of his own collection. The size of the pot, however, is important, and it may be stated that it should never be larger than what is just sufficient to enable the plant to form its next bulb comfortably. The potting material varies greatly according to position, climate, country, and the ideas of the cultivator; but, speaking from my own experience, and judging from the condition of my own plants, the following will, I think, be found a good basis whereon to work.

First, "crocks," or potsherds, should not be used for drainage. This practice is now abandoned by all the best growers, and the rhizomes of the common brake fern, found in the peat formed from the debris of this plant, are used instead. These should be well "baked" before using, in order to kill any germs or fungus-mycelium which may adhere to them. They should be cut into pieces one to two inches in length, and two-thirds of the pot should be filled with this material, to act as drainage; and the remainder should be filled with a compost consisting of one-third good fibrous peat, one-third oak leaves, and one-third sphagnum moss, with a little sharp sand. The oak leaves should be gathered soon after falling, and they should be stored under cover for about a year in order to prevent them from rotting, as actual decomposition dissipates the nutriment they contain, and defeats the object in view in adding them to the peat; and it is advisable to have a layer of rough ashes beneath them so as to prevent the ingress of worms. The leaves should be rubbed through a sieve of half-inch mesh in order to break them up a little, and the peat should be broken up into pieces not larger than a hazel-nut. The peat should be well incorporated with the sphagnum, and this and the oak leaves should then be well mixed together, a little silver sand being added to keep the compost open, and in this the plant should be firmly potted. Water should be judiciously applied, and the greatest care should be taken not to overwater the plants. On hot summer days water finely sprayed over the plants is very beneficial. Fumigation is necessary in order to destroy insects; but tobacco paper or cloth should never be used. The best insecticide with which the crispum grower has yet been provided is undoubtedly "XL ALL." The observant amateur cultivator will soon ascertain from the appearance of the plants whether all goes well with them. If the conditions are favourable, growth will be strong; but should the reverse be the case, advice should be sought from someone who can give the necessary information to his less fortunate fellow-cultivator.

In due time the flower spikes will appear. As a rule, strong plants bloom the year following importation, though, of course, they do not show their full beauty till after they have become quite established. Now it is that the interest commences in real earnest. Day by day, night by night, the developing buds are watched by the expectant cultivator in order to see whether he is to obtain a great prize or but an ordinary form. If it be the former, great is his joy; if the latter, then, as "Hope springs eternal in the human breast," he betakes himself to the other spikes, there to watch with the same intent interest as he did before. That prizes, and great ones, do come is matter of common knowledge; and as all the plants are gathered in a wild state, very few of them being seen in bloom by the collectors, the buyer of imported plants has always the chance of flowering something finer than anything that has yet been seen. The highest price hitherto paid for a crispum variety is £1,500, and this for a plant which would have gone into an ordinary glass tumbler. Many plants have been sold at sums ranging from £500 to about £1,000. Scores have realised from £100 to £200, while hundreds of examples exist which have realised £50. I have seen plants in bloom which cognoscenti would call rubbish sold for 4s. per dozen. The tyro gloats over such purchases at first; in time he becomes one of the cognoscenti, and then he too considers them rubbish. I know one grower who at a certain auction sale bought three plants for 19s. One of these, which he named after himself, turned out a very fine form, and the plant has been valued at no less than £800. In nature, these fine forms are no doubt produced by insect agency. Many species very frequently grow in the same forest; and the endless crossing and re-crossing of species and of their hybrids and varieties which has taken place has resulted in the evolution of these forms, and this in a manner which the hybridist has as yet failed to discover. The beautifully spotted forms are the most prized of all the odontoglossums, and the more of these that flower the greater does the demand for such forms seem to be.

One error into which the tyro generally falls is to leave the flower spikes too long. This exhausts the plants, and the spikes should therefore always be cut when they are fully developed, say, when a fortnight old as a maximum. If this is done the plants will not suffer any harm.

The propagation of Odontoglossum crispum is easy enough when one understands how it should be done, but many a valuable form has been lost owing to want of knowledge of this important cultural operation. It is a difficult thing to explain in a short article such as this is, how propagation should be carried out, but, generally, the best way is to sever the leading pseudo-bulb from its fellows when its growth has reached the height of 2 inches. The rhizomes from which the bulbs spring should be cut through with a sharp knife, and for a fortnight afterwards the plants should have dry treatment in order to facilitate healing of the wounds.

As cut flowers, crispums excel in beauty, and almost all of them last for a long time in the cut state, more especially if they are allowed to remain on the plant for about a fortnight after opening.

For cultural purposes, under crispum may be included such species as triumphans, gloriosum, luteo-purpureum, Hunnewellianum, Lindleyanum, and such hybrids as loochristiense, Andersonianum, Wilckeanum, Adrianæ, and Coradinei. These and the blotched crispums grow well together, and collectively they give to the lover of plants the greatest possible amount of enjoyment which the cultivation of any single genus can give.

Rhus Toxicodendron.—In commenting upon the varied statements concerning the poison ivy that appeared not long since in the daily Press, Mr. W. J. Bean remarks in the "Kew Bulletin" that among the recent correspondents of Kew was a lady who sent the true Rhus Toxicodendron with the remark that she had used the leaves for dinner-table decoration. As no evil consequences were recorded she was evidently one of the persons who are immune from the effects of this poison. This correspondent also drew attention to an interesting property of the juice of this plant, namely, its indelibility when applied to linen and similar fabrics. She states that wherever the liquid touched the white table-cloth it produced a perfectly ineradicable stain, and remarks that "it is really better for marking purposes than many so-called indelible marking inks." The property has long been known to botanists. Kalm noticed it during his travels in North America about the middle of the 18th century. And in Woodville's "Medical Botany" (1832) it is stated that "this juice, applied to linen, forms one of the most perfect kinds of indelible ink; it does not fade from age, washing, or exposure to common chemical agents . . . . but continues to grow darker as long as the linen lasts." It may be mentioned that the juice (which immediately exudes from a broken or cut surface of the wood or leaf-stalks) is at first milky and yellowish, but soon becomes black.

THE MANAGEMENT OF HEDGES.

Hedges occupy an important position in many gardens, and apart from their ornamental character, they are, under proper management, of the greatest possible utility in acting as a wind screen and shelter for more or less tender plants. There is, however, another side to the question, and it not infrequently happens that we find anything but satisfactory growth or returns in crops of all sorts for several feet distant from the hedge. This is attributed by some to the shade cast, but the real cause is found in the fact that the hungry and far-reaching roots of the hedge plants deprive the soil of its stores of plant food and moisture.

When taking charge of a garden in Surrey, many years ago, where the kitchen garden was bounded on three sides by a dense hedge, I found that the roots of the yew, holly, and Portugal laurel had been allowed to extend unchecked, with the result, and more especially in the fruit quarter, they were found quite six feet away from the hedge. Immediate steps were taken to remedy matters; a narrow trench was cut out three feet deep at two and a-half feet distant from the hedge, and the whole of the roots severed during the process. The change effected in the growth of everything beyond the trench was remarkable, and no appreciable difference could be detected at the end of the season between the plants near the hedge and those further afield.

In this case the trench was left open, and on account of being only nine inches wide was inconspicuous. If filled in it would be necessary to repeat the operation every alternate year, and I may mention that in a Western garden where I was employed the then head gardener experimented with concrete, which effectually removed any further trouble in this direction. If, however, large trees are in close proximity to the hedge it is highly probable that the powerful roots would break through a concrete barrier.

Walter H. Aggett.

PRUNUS TRILOBA.

On several occasions we have illustrated this exquisitely beautiful flowering shrub for the purpose of drawing attention to its great merits for early flowering out of doors. We have also frequently referred to its value as a shrub for forcing, and we now give an illustration of it thus grown. Some of our useful forcing shrubs may be forced year after year, if treated in a generous manner, and P. triloba is one of them. After it has been forced into flower, and the blooms have faded, the plants should be pruned hard back and placed in genial warmth, where, given sufficient moisture, new and vigorous growth will be made. It is necessary to gradually harden off the plants so treated, and a sunny position should be provided out of doors as soon as weather permits. Weak liquid manure is very helpful while growth is vigorous. The specimen illustrated herewith is one grown by Messrs. William Paul and Son, Waltham Cross, who for many years have made almost as great a feature of pot-grown early-flowering shrubs for forcing, as they have of roses.

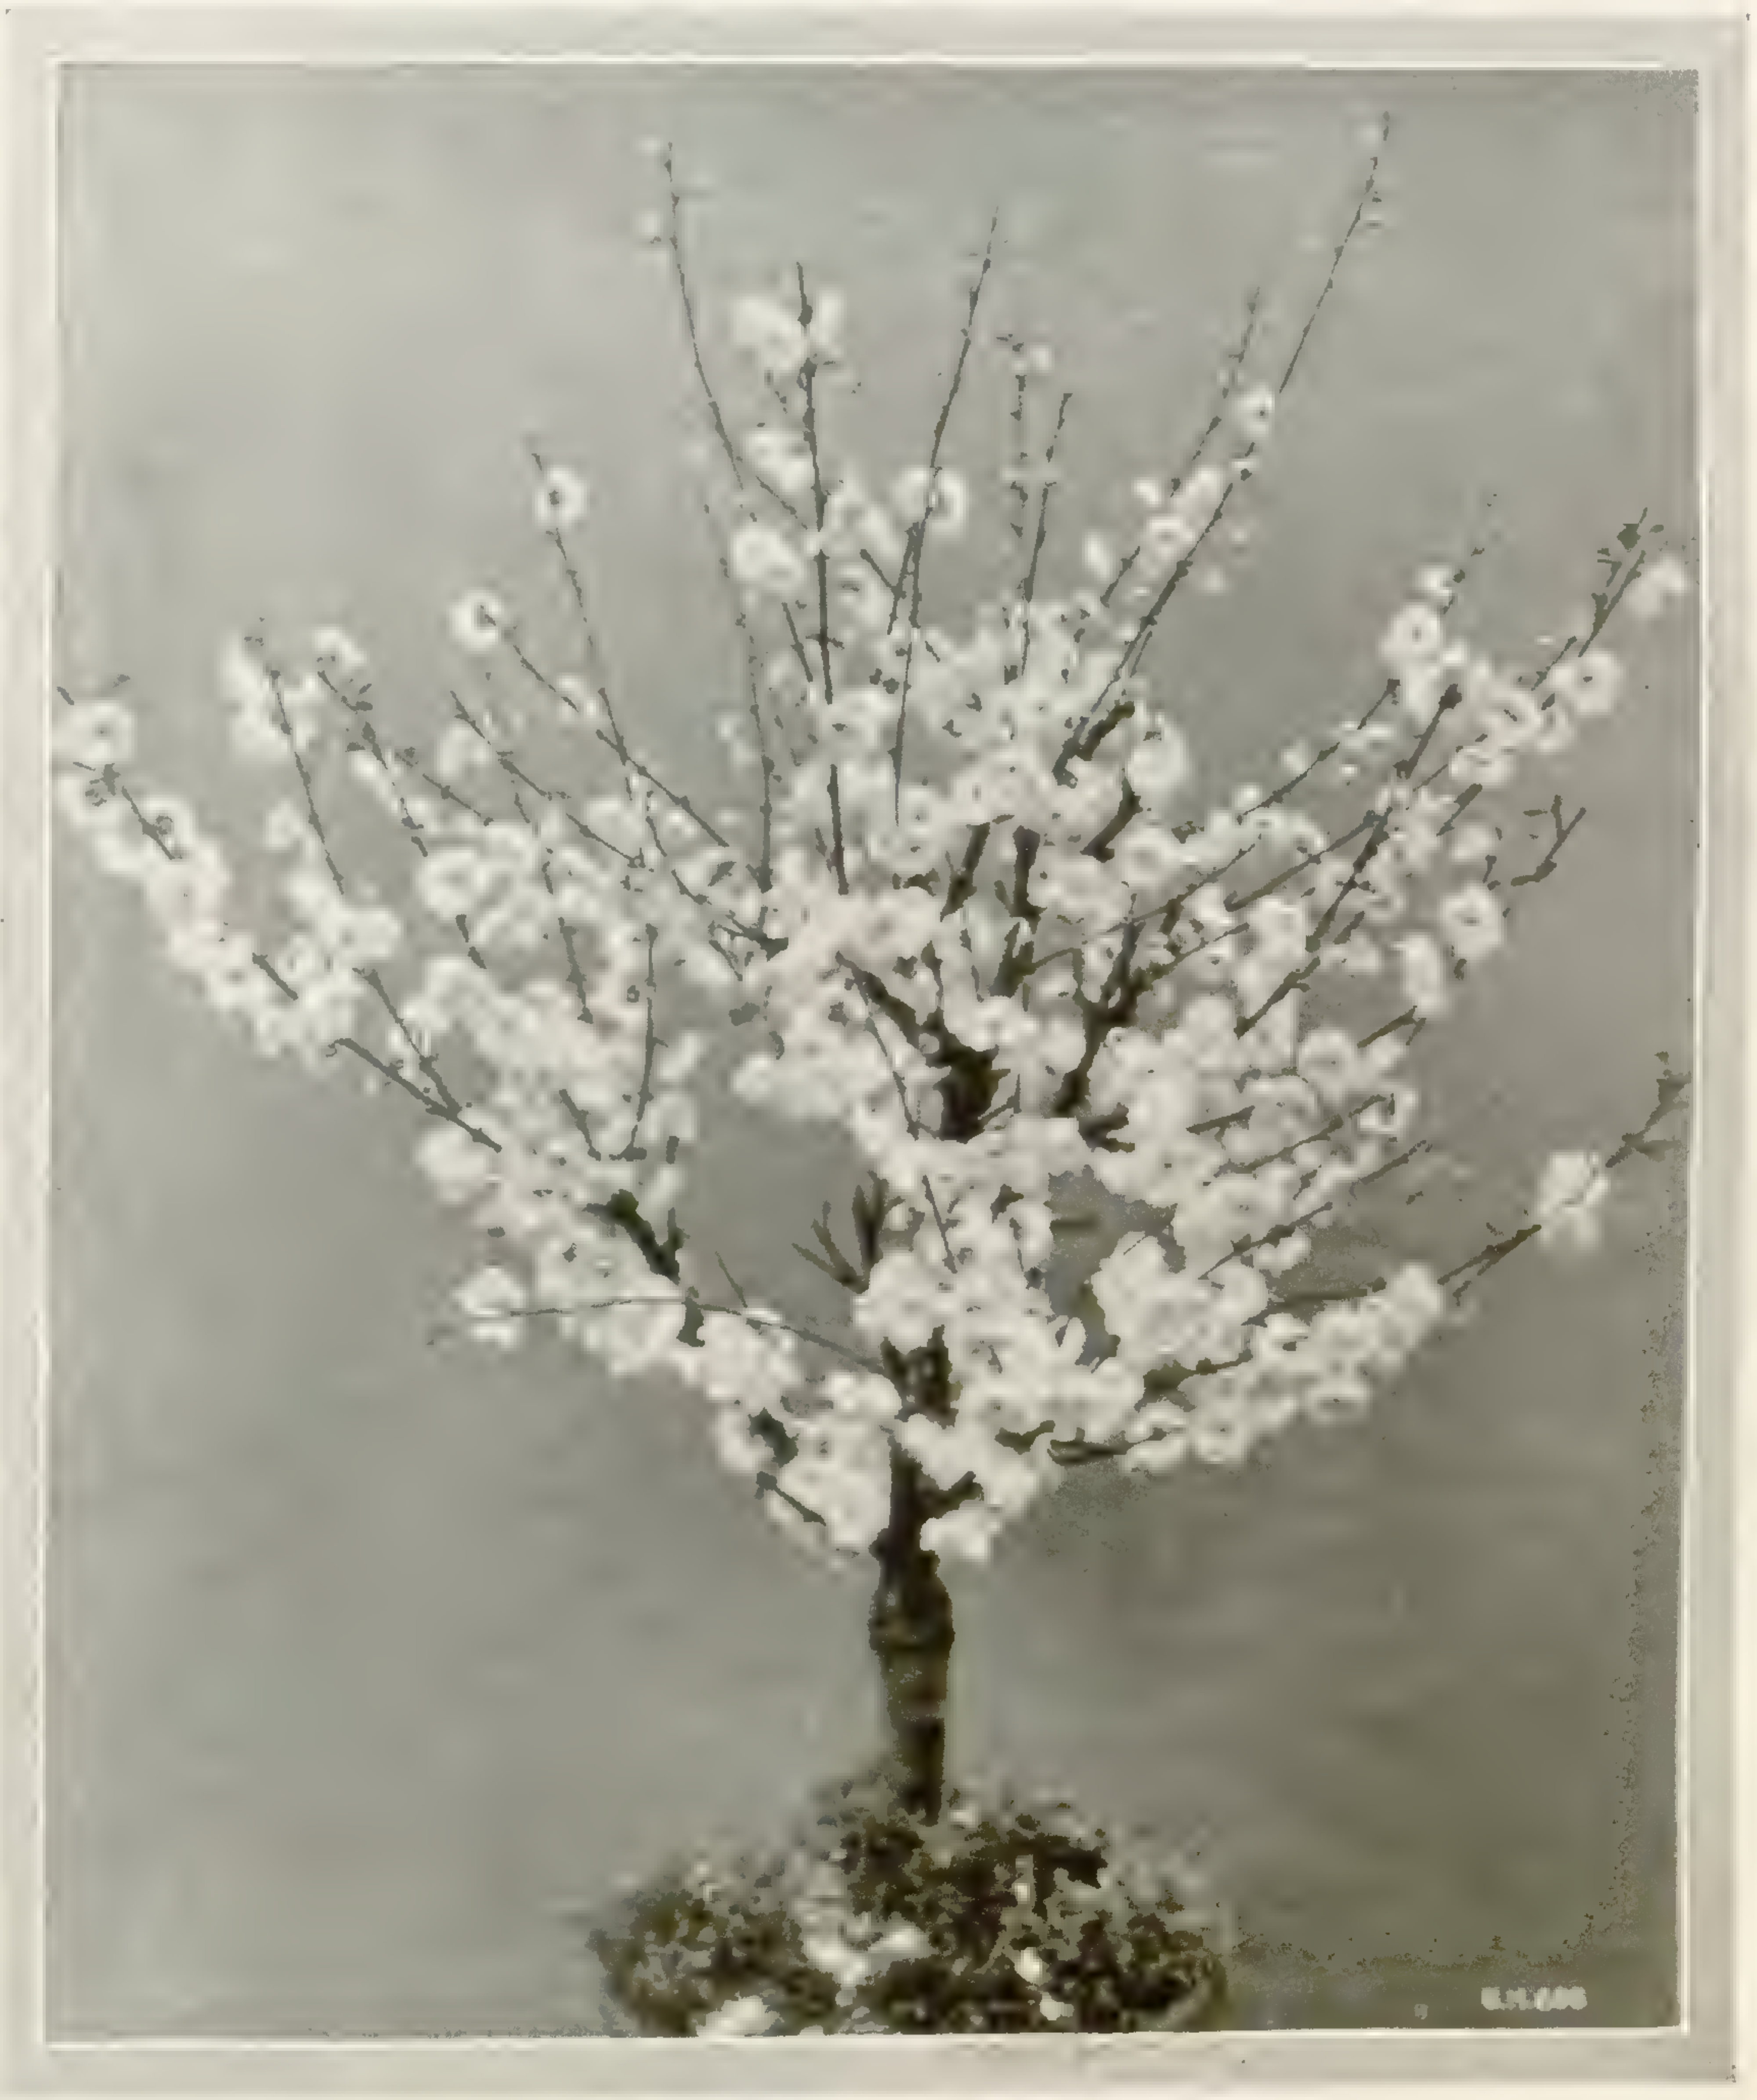
BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

THUNIAS.—The various species and hybrids of this genus will now be showing new growths, and they should be removed from their cool resting quarters and placed under growing conditions. It is advisable they should remain a few days under warmer treatment before they are repotted, but they must be thoroughly watered, so that the hard, dry compost may be the more readily removed when the plants are turned out of their pots. It is necessary that these brittle-rooted orchids should be repotted before the new roots become far advanced, thus avoiding damage, as far as possible, during the operation. Turn the plants out of their pots, and, after removing the potting compost, cut off the old roots to within two or three inches of the stem. Any old pseudo-bulbs may be removed, and where there is any vitality left in them they may be placed on one side and used for increasing the stock. After having cut away all dead and decaying material about the base of the last-made growth, examination should be made for scale and other insect pests, which may be found secreted beneath the dead leaf scales. Where insect pests are found the stems should be thoroughly cleansed by washing with strong soapy water or some safe insecticide; cleansing the old growth will to some extent prevent the new becoming infested.

SPECIMEN PLANTS.—For specimens it is desirable that several plants should be placed together in the same pot, therefore a stick sufficiently strong to secure each in position should be neatly affixed. The pots used should be clean, and drained to about one-third their depth with clean crocks. The compost we find suitable consists of about equal portions of fibrous peat, turfy loam, and chopped sphagnum moss, with sufficient sand and finely broken crocks intermixed to render the compost porous. The plants having been placed in their position in the pot, the compost should be made firm about them, care being taken to see that the base of the young growth is only just on a level with the potting compost, and not buried, or they will be liable to damp and rot off. Water carefully until the new roots get hold of the compost, but as growth advances and the pot becomes filled with roots, liberal treatment may be afforded. The conditions of an ordinary plant stove suit the thunias, but to induce satisfactory flowering it is desirable that the plants should be afforded ample light.



PRUNUS TRILOBA.
A forced specimen exhibited by Messrs. William Paul and Son, Waltham Cross; flowers double, soft pink.

INCREASE OF STOCK.—Any of the pseudo-bulbs that have been discarded, or old ones that are still in a plump state, and removed as suggested above, may be cut into lengths of about two nodes each; the cuttings thus made should be placed in pots, several together, using a compost of finely chopped sphagnum moss and sand. The pots should be placed in a brisk bottom heat, when they soon push new growths, which emit roots at an early stage, and as soon as the roots are observed, the plantlets should be potted up separately in small pots and shifted on as required. It is rarely such plants flower the first season, but they make good stock for future use.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS. — Preparations should now be made for potting the most forward plants into 32-sized pots, using a fairly rich compost and potting firmly, afterwards placing them in a cold frame and giving them plenty of room. They should be kept close for a few days, and syringed twice a day when weather permits, gradually increasing the ventilation as they make new roots. Cuttings of decorative plants put in the middle of last month should be fit for potting off into 60's, treating them as advised above. The present is a good time to put in a batch of cuttings for flowering in 32-sized pots, and the best plan at this season is to dibble the cuttings, about two inches apart, in boxes, placing them in a house or frame where a moist atmosphere is maintained, and here they will soon make roots. These late-rooted cuttings are particularly well adapted for giving big blooms for grouping in the conservatory or at exhibitions, and some varieties produce flowers of greater excellence by this method than by any other.

CANNAS.—When good batches of these plants are required for conservatory decoration the present is a very suitable time for breaking up the old stools and repotting; for making big plants pieces of the old root with three or four eyes should be potted up into 32's, to be afterwards transferred into 9in. or 12in. pots, but by far the most useful method of growing these beautiful subjects is to pot each young shoot singly into 54-sized pots, afterwards potting them into 32's. The young rhizome should be severed from the old stool with a sharp knife, taking care that there are a few young roots attached, and be potted up in a compost consisting of loam, leaf-soil, and sand. These, if placed in an intermediate house, will soon make roots and grow freely, but care must be taken not to over water in the early stages, though afterwards, when potted into their flowering pots, they will need plenty of water and quantities of liquid manure, liberal feeding being the one thing essential to ensure success.

BEGONIAS AND GLOXINIAS that are getting forward in growth should be potted into their flowering pots and kept steadily growing, as it is very bad practice to keep them long in the small pots. Seedlings of these, as well as of streptocarpus, torenias, etc., etc., should be pricked off as soon as large enough to be conveniently handled, the rapid growth following this operation proving how much the seedlings appreciate a change of soil. Seedling celosias, cockscombs, smilax, and other things should also be potted off when large enough, keeping these as near the glass in a warm house as possible, thereby securing a sturdy growth.

PROPAGATION.—Continue the propagation of any plants needed. Coleus are especially useful in small pots, as well as tradescantias and panicum for edging the stages throughout the summer months. The present is also a very suitable time for propagating batches of Salvia splendens grandiflora for autumn blooming. S. patens will also be useful in the greenhouse during August and September if propagated now. Further batches of seed should be sown of such subjects as celosias, torenias, schizanthuses, clarkias (for pots), etc.; Humea elegans should now be sown to provide plants for pots or bedding in 1910.

FORCED PLANTS.—many of the earliest plants may now (if they have been properly hardened off) be placed out of doors under some temporary shelter, thus making room for those that are still being forced or grown on. A great many of the narcissi that have been forced may be planted out in the copse or wild garden, this being much better than keeping them standing about in pots until they dry off, and it entails much less labour. —Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

CLIMBERS.—In nearly all gardens one has to deal with climbing plants in some way or other, and never probably in our history have these been so largely employed for various purposes as at the present moment. We have a wealth of both foliage and flowering subjects, and yet it is somewhat surprising that even now better use is not made of many of the more beautiful, in place of the more common kinds which occupy prominent positions on many of our houses and buildings. I strongly urge those who have favourable aspects occupied by uninteresting kinds to take steps at this season of the year to add others more worthy of the place. The pruning and training should now be pushed forward without delay, and at the same time in many cases it will be necessary to provide some good material for the roots. Large pillar roses should be severely pruned or thinned out, for after these have become at all aged the old growths should be completely cut away to the base, and the younger ones be laid in; and apply a good mulching of half-decayed farmyard manure. All poles and supports should be examined, and when at all doubtful new ones should be provided.

PROTECTION.—Plants which have been protected during the winter, notably the more tender shrubs and trees, should now be examined, and the covering partially removed, but care should be taken not to expose them too suddenly, or they will in all probability suffer more than if no covering had been given.

TUBEROUS ROOTS.—Dahlias, cannas, begonias, marvel of Peru, Commelina cœlestis, etc., which have been stored away in suitable places for safety during the winter months, ought now to be brought out, potted up, and started into growth. Cannas may be divided up into quite small pieces, and placed fairly thickly in boxes, when they will make charming plants by the bedding-out season. Dahlias may easily be increased by rooting the young growths as fast as they are produced, in strong heat, and they should be quite large enough for planting out the first week in June.

PROPAGATION.—This should now be expedited as speedily as possible, and though much may be done during the next month, it is best to complete the work as soon as possible after this date. The potting up and boxing off of the various kinds of soft-wooded plants required for summer bedding should also be completed as early as possible.

SEED SOWING.—There will be many kinds of seeds, both of annuals and perennials, which should be sown now. The majority should be raised in gentle heat, be duly pricked off, and well hardened before planting out during the month of May; they will include asters, celosias, stocks, zinnias, lobelias, marigolds, mignonette in small pots for early flowering after planting, verbenas, and solanums of sorts. Aquilegias, pyrethrums, delphiniums, and campanulas may also be sown, and pricked off in due course. Shrubby calceolarias and other half-hardy plants which were struck and wintered in frames should now be given more room by planting them out in other lights, a good distance apart, and air should be given freely whenever possible.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

THE RAINFALL for this year, up to the present, has been under the average, and it is very probable, and more especially on light soils, that the borders by the walls will be found much drier than is usually the case at this season, so that it will be as well to thoroughly examine all wall fruit borders, and those found dry should receive a good watering forthwith, as dryness at the roots is not conducive to a good set of fruit.

NEWLY-PLANTED TREES should be examined to see that they have not been loosened by winds or frosts, making each secure, the standard trees by refastening them to their supports, and the dwarfer kinds—as pyramids, and bush-trained—by well firming the soil about the roots. If these newly-planted trees were not mulched with some light strawy material at the time of planting no time should be lost in attending to this work, so that the moisture may be conserved in the soil among the roots. See that permanent labels are affixed to each tree before the writing on the nurseryman's tally is obliterated, and thus much inconvenience will be spared later on.

PRUNING FRESHLY-PLANTED TREES.—This work is best done after the sap commences to rise freely, and the young buds begin to push forth. The various kinds of fruit trees, when once established, require somewhat different treatment in the matter of pruning, but young planted trees may be treated very much in the same fashion in the first season. The general principle is to shorten all the main shoots by about one third of their length, always pruning to a prominent wood bud, pointing in the direction that the young growth is expected to take, and shorten all laterals back to two or three buds.

GRAFTING.—This operation may be performed as soon as the sap in the stocks commences to rise freely. Time should not be wasted by inserting grafts on anything but thoroughly healthy stocks; far better grub up old trees and plant good standard varieties. While on this subject I should like to say that in these gardens, where hardy fruits are largely grown, we find it is a good practice to always have a few trees in hand for replacing any worn out or worthless varieties. There are several advantages in this system, not the least being that one is able to fill up the vacancy with a larger tree than one would care to get in from a nursery, and which can be shifted as early in the autumn as the leaves are ready to fall, and while the soil is still sufficiently warm to encourage the tree to establish itself in its new position. By this means the tree is able to produce a fair crop of fruit during the following season. Another advantage in replanting trees two or three years after being received from a nursery is that many will be found with a tendency to send their main roots downwards into the subsoil, thereby causing unfruitfulness; these roots are cut away when transplanting, and this does away, in a great measure, with the necessity of root pruning in after years.

CLEFT OR RIND GRAFTING may be followed when operating on old trees. In cleft grafting the branch is split down the centre by a chisel and mallet, the chisel being left in to keep the crack open until the scions are inserted. It is necessary for success that the edges of the bark on both the stock and scion should fit together. In rind grafting the bark only of the stock is cut down, about four inches, the scions being prepared by tapering about three inches at the lower end, making a shoulder to rest on the stock by means of a slight horizontal cut at the point where the downward cut commences, the scions being pushed down between the bark and the wood until the shoulder rests on the stock; two or three scions may be fitted to each branch. Bind the young scions firmly in their positions with some broad strands of raffia, covering the whole with grafting wax or prepared clay, the object being to exclude air until the union of stock and scion is complete.—Geo. Woodgate, Rolleston Hall Gardens.

Thalictrum adiantifolium.—As its name implies, the foliage of the Maidenhair-leaved Rue is so much like that of the maidenhair fern that it might almost be mistaken for it. It is, however, stiffer in character, and more lasting when cut [illegible] recommendations for growing it. It will grow in any ordinary soil, but it is in sandy loam that it really luxuriates, where it forms large clumps which are really beautiful in themselves. Where it thrives in this way it may be used for edging with good effect, though it needs a few little sticks put amongst it to keep it from falling down. Given favourable conditions it makes a good subject for naturalising in shrubberies. The flower is quite insignificant, and for the sake of the foliage this should be picked off as soon as it appears. It is easily propagated by division in the autumn, before the leaves have died away, or in early spring.—Alger Petts.

CRITICAL NOTES.

It is not uncommon for honours to be bestowed on some individuals late in life, and what is true of human beings apparently applies to apples as well, for on February 23 the Fruit committee of the R.H.S. granted a First Class Certificate to that well known apple Barnack Beauty. I do not know the origin of the variety, nor yet its history, but I am aware of the fact that it has been in cultivation for a considerable time, and I can't quite see whether the granting of a F.C.C. now will serve any useful purpose. Mind you, I have no reasons for criticising the action of the committee; they may have good reasons for what they did, but I am thinking that there are many good old apples that have never been recognised in the same way as yet, and if they were sent up to Westminster the Fruit Committee might be kept quite busy for some time to come in granting Certificates and Awards of Merit.

Why are oranges not grown more in British gardens? Your correspondent "C." asks this question on page 185, and remarks that while numbers of houses are occupied by peaches, few are devoted to oranges, and yet the latter yield freely, and the crop lasts over a much longer period than peaches. Perhaps a good many garden owners have not tasted a fully ripe English-grown fruit, which privilege has been enjoyed by "C," and his description of the above fairly makes one's mouth water, but the fact remains that oranges are not a glass crop in English gardens. There is such a thing as familiarity breeding contempt, and I doubt if as much glass would be devoted to peaches if these fruits were offered for sale on every costermonger's barrow, even if the quality bore no comparison with the glass-grown fruit. One has recollections of sweating in a pine pit years ago, but few people grow pines to-day, and their culture ceased when St. Michaels stepped in, though it would have to be a high-class St. Michaels that could compare with fruits grown in English pine stoves in the old days.

Calendar matter, I take it, is written for the benefit of the uninitiated rather than for the gardener, who may reasonably be expected to understand his business; and, this being so, for fear any amateur reader should go wrong in his operations, I should like to ask the writer of kitchen garden notes, on page 190, to explain the reason why he advises the use of a light dressing of soot and lime in the preparation of an onion bed. Lime, I know, is essential to fertility, and soot is a very good fertiliser, but to use the two together is surely wrong, as the mixing leads to the loss of the valuable nitrogenous properties contained in the soot. Naturally, in the use of soot one wants to make the most of the fertilising properties it contains.

Mr. H. Vincent, of Brighton, must be a most unselfish man, because, having learnt the art of making £60 a year from half an acre of land, he does not object to telling other people how they can do likewise. He has imparted this useful bit of information in his much-talked-about little book, and recently also in a lecture before the Beckenham Horticultural Society. Fancy £60 from half an acre with only a foot of soil resting on chalk, and no artificial manure! There, you gardeners, English and French, what do you think of that? Mr. Vincent advocates planting potatoes in November eight inches deep. I wonder if they get much frost down Brighton way, because I was tempted to plant potatoes in the autumn once quite eight inches deep, but we had a severe winter after it, and those unlucky potatoes were never seen afterwards. Again, intensive culture is a fine thing, but parsnips in rows a foot apart, with cabbages between, seems too much of a good thing.

In a recent issue a correspondent asked for information regarding a bait for mole traps, and a reader, on page 194, suggested the use of worm oil, an article, by the way, which I don't suppose many readers of the GARDENERS' MAGAZINE had ever before heard of. In the event of the worm oil not answering, and assuming that the correspondent who sought for information is not so adept at setting traps as some old labourers I know, let me give him another tip—shoot the moles. A farmer informed me quite recently that in 1908 he shot over 200 moles in January and February, and has had no trouble with them since. White frosty mornings are the best for the sport, as the freshly-thrown hillocks are easily seen, and the method is to approach very quietly, and watch for the movement of the soil. As soon as this is observed fire into the bottom of the hillock from a distance of four to six yards, and if the aim is straight the dead mole is generally to be found. H.

INJURIES TO PLANTS DUE TO HAIL AND FROST.

Hail.

The injury to foliage and flowers caused by hail is well known; the fact that an equal, or perhaps greater amount of damage to the bark of trees is due to the same cause, is not so generally realised, the wounds formed being often attributed to frost, insects, or fungi. Young trees, or the young branches of older trees suffer most, especially those kinds possessing a smooth bark. The injury caused is greatest during the early summer months, when the trees are in full growth, as at this time the bark is soft and most easily injured by bruising. . . . When soft bark is struck by a hailstone with moderate force, the bark is completely crushed and disorganised at the point of contact, and soon becomes dead and dry, contracting at the same time and breaking away from the surrounding living bark. Owing to this contraction, a fissure is formed separating the dead from the living portion, which too frequently enables the spores of different kinds of parasitic fungi to gain an entrance into the living portion of the branch, and complete its destruction.

It rarely happens in this country, that hailstones do a greater amount of damage to trees than indicated above, but in tropical countries where such storms are very severe, the amount of injury done must be immense. Under such conditions I have seen galvanized iron roofing perforated by hailstones as readily as if it had consisted of paper.

In speaking of the damage done to trees, Hartig says:—"At places where the hailstones strike the rind is crushed, or it may be knocked off altogether. Although as a rule, a callus very soon forms over such wounds, still it not infrequently happens that the injured portion of the stem dies. In young spruce woods in the neighbourhood of Munich, I found that the leading shoots which were affected by hailstones died—a result doubtless due to the excessive evaporation from the wood, which in many cases was stripped of its cortex on one side of the shoot to the distance of about an inch."

Spring Frosts.

These are, with much reason, dreaded by those concerned with the cultivation of plants. Many kinds of plants that survive without injury severe winter frosts, succumb to a comparatively slight frost after growth has commenced. This difference depends on the relative amount of water present in the tissues during different seasons of the year. When active growth commences the leaves and youngest shoots contain a considerable amount of water. During a late spring frost water is abstracted from the cells into the intercellular spaces, more especially under the epidermis of leaves and shoots, where it freezes into parallel prismatic crystals. The withdrawal of water from the cells of a leaf causes it to droop and exhibit the well-known symptoms of the effect of frost. The recovery or death of a frozen leaf depends mainly on the precise manner in which thawing takes place. If the process is gradual, allowing the water to be reabsorbed by the cells as it thaws, little or no injury is sustained, whereas if the thaw is sudden, due to bright sunshine early in the day following a sharp frost, the rapidly liberated water floods the intercellular spaces, instead of being absorbed by the cells, and the death of the organ results. When actively growing leaves are frozen late in the spring, the epidermis of the under surface is often completely torn away from the remainder of the leaf, and hangs like a blister. Cabbages are often injured in this manner. The young leaves of evergreens also suffer in a similar way.

Frost Cracks.

These are longitudinal cracks of variable length in the bark and wood of tree trunks, and are the result of a great and sudden lowering of the temperature. In this instance water is withdrawn from the cell walls, and freezes in the cavities of the cells. Owing to loss of water from the cell walls the cells shrink, and a crack is the result. When the temperature rises the cell walls re-absorb the water, causing the cells to expand, and the crack closes more or less. The subsequent formation of callus completes the work of closing the wound. It not infrequently happens that an old frost crack, being a weak point, is reopened by succeeding frosts. As a rule little direct injury results from frost cracks in the case of our native trees, but they often enable parasitic fungi to gain a foothold. When a frost crack is completely healed, the callus formed from the two edges of the crack meets, and forms a more or less projecting ridge, known as a frost rib.

Sub-tropical trees often suffer severely from frost when grown in this country, even when not at first killed outright. Catalpa bignonioides, Walt., an ornamental tree, a native of Southern United States, is often injured by frost when growing in England or in the New England States. A very fine specimen at Kew, about sixty years old, recently succumbed from the cumulative effect of frost. The tree had two tiers of three more or less horizontal branches each. When the branches of the upper tier were about forty years old, each one was injured by a severe frost crack throughout its entire length. These wounds never completely healed, and afterwards no more shoots were produced on these branches, the result being a scarcity of leaves, which resulted in the crown of the tree being literally starved to death, owing to lack of food and water. The lower tier of branches, being sheltered by the upper ones, was perfectly healthy, and carried an abundance of foliage and flowers when the tree was cut down.

Something can be done to protect plants that have been caught by a spring frost. They should be protected by a covering of some kind—sheets, straw, etc.—from the sun's rays, so that they may thaw gently and gradually. When the covering method is impracticable, a thorough spraying with cold water is often effective in preventing rapid thawing.

In the case of frost cracks or injury caused by hail, the wounded parts should be sprayed with Bordeaux mixture at intervals until a callus is formed.—Mr. G. Massee, V.M.H., in "Kew Bulletin."

Choisya ternata as a Seaside Plant.—For growing in gardens near the seaside, either as a wall or a bush plant, Choisya ternata is a most useful one. Few shrubs bear more beautiful leaves, and fewer still such delightfully fragrant flowers, which are borne in clusters very freely. Cuttings root readily in a sandy compost in a cool frame; the younger wood striking as freely as a zonal pelargonium, in a hotbed. A well-grown plant has foliage sweeping the ground, and forms a dense thicket. It will grow in almost pure sand, but a friable loam is the most suitable soil. Cuttings may be inserted at once.—G. GARNER.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

On Tuesday, March 23, there was another fine exhibition at the Royal Horticultural Hall, Westminster, all the space being occupied with orchids, cinerarias, begonias, daffodils, and forced shrubs. During the early part of the afternoon there was a crowd of visitors, that rendered notetaking and the careful inspection of groups almost an impossibility.

FLORAL COMMITTEE.

The central exhibit of the show was a large and elegant circular one of perpetual carnations, arranged artistically by Messrs. Hugh Low and Co., Enfield. The flowers in great variety were arranged in baskets and in vases of various kinds, and the groundwork was of moss and maidenhair ferns. This firm also showed acacias in bloom, A. cordata and A. armata standing out finely among many others. Messrs. Heath and Son, Cheltenham, showed an assortment of scented-leaved pelargoniums and flowering plants of carnation Lady Audley Neeld.

The new rose Rhea Reid (A.M.) was shown by Mr. G. W. Piper, Uckfield; this H.T. variety has been a great success in America and in the Bagatelle trials in Paris. A few cactus-flowered cinerarias were sent by Messrs. Jarman and Co., Chard. Messrs. C. Brooks and Co., Worting, Basingstoke, showed examples of their fine selections of florists' primulas. Their Orange King, Queen Alexandra, Giant Crimson, Ruby Queen, Duchess, Brilliant King, and True Blue were splendid in form, size, and colour. Messrs. Frank Cant and Co., Braiswick Nurseries, Colchester, showed three stands of the charming Lady Roberts rose, the buds and open flowers being delightful in form and colouring.

Cinerarias of the cactus-flowered type were largely and finely shown by Messrs. Sutton and Sons, Reading, who have now a fine strain of these elegant flowers, and have them in a very large range of colours. These are particularly useful cinerarias for conservatory decoration, and are, with many, greater favourites than either the Star or florists' forms. Particularly fine were the perpetual carnations shown by Mr. H. Burnett, Guernsey, whose beautiful exhibit of Mrs. Burnett, Mikado, Enchantress, and Marmion was greatly admired.

Dwarf lilacs, beautifully flowered, were largely shown by Messrs. Paul and Son, Cheshunt: Souv. de L. Thibaut, Comtesse H. de Choiseul, Alphonse Lavallee, Souv. de Leon Spathe, La Tour d'Auvergne, Mdme. Lemoine, and Marechal de Bassompierre were all charming varieties, and the scent of the display was delightful. At the back of the group were standards of Calceolaria Burbidgei. Messrs. J. and A. Clarke, Lim., Dover, set up a low rock garden, and stocked it with alpines, flowering shrubs, and tulips.

Mr. W. H. Page, Tangley Nurseries, Hampton, contributed one of his splendid groups of grand liliums and perpetual carnations, showing both in grand style, and setting up the whole in a very attractive manner. Messrs. T. S. Ware, Lim., Feltham, were represented by a collection of alpines and early flowers, the crocuses, hepaticas, androsaces, and saxifragas being all very pretty. Rose Doré, the fine new rose-red perpetual carnation, was largely shown by Mr. Lancashire, Guernsey. Mr. W. P. Horton, Cravenhurst, Seaford, showed a miscellaneous collection of flowering plants, azaleas and spiræas predominating.

A brilliant exhibit of Indian azaleas, all smothered with blooms, came from Messrs. James Veitch and Sons, Chelsea, the varieties Mdme. Joseph Vervaene, Vervaeneana, Empress of India, Hexe, and the bright Apollo, being conspicuously good. This firm also set up Boronia megastigma and its variety aurea, oranges, anthuriums, and some intensely blue-flowered plants of Hydrangea japonica. In another part of the hall the Veitchian firm had some beautiful rhododendrons, including Pink Pearl and Ascot Brilliant. Mr. G. Reuthe, Keston, Kent, submitted hepaticas, snowflakes, primulas in variety, Himalayan rhododendrons, saxifragas, irises, and other delightful early flowers. Very fine indeed were the cyclamens staged by the St. George's Nursery Co., Harlington, Middlesex; the flowers were fine, the colours pure, and the plants carried sheaves of bloom. Mr. R. Sydenham, Birmingham, showed daffodils and lily of the valley, finely grown in moss fibre in undrained pots.

The rock garden arranged by Messrs. J. Cheal and Son, Lowfield Nurseries, Crawley, was attractive, by reason of the small shrubs, and a large collection of primulas it contained. We thought the rocks were rather too prominent on this occasion, but there was method in the prominence thus given, as the rock is Sussex sandstone, of special merit for rock gardening. The sweetly-scented Boronia megastigma, and equally fragrant Daphne indica were shown by Messrs. H. B. May and Sons, Edmonton, and this firm had also a selection of elegant hardy ferns.

A beautiful group of Begonia Saturne, a delightful, erect spiked, pink-flowered variety with stout bronzy green leafage, was staged by Messrs. H. Cannell and Sons, Swanley. This is a fine conservatory plant, and it attracted a very great deal of attention and admiration. Perpetual carnations were shown by Messrs. Wm. Cutbush and Son, Highgate. A bright group of well-grown Azalea mollis was set up by Messrs. R. and G. Cuthbert, Southgate, and Messrs. Bakers, Wolverhampton, had a group of alpine flowers.

ORCHID COMMITTEE.

Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, brought up a fine plant of Dendrobium Schneiderianum Westonbirt var. (A.M.), a very handsome yellow and soft purple orchid; Lælio-cattleya Tigris with golden flowers; and magnificent specimens of Cymbidium eburneo-Lowianum, with thirty-two spikes and 155 flowers, and C. Lowio-eburneum Westonbirt variety, with nineteen spikes, carrying a total of 91 flowers. Cultural commendations were awarded. Messrs. A. J. Keeling and Sons, Westgate Hill, Bradford, showed seedling dendrobiums, their D. Chessingtonense var. Richness being especially fine. Messrs. Stanley and Co., Southgate, showed Lycaste Skinneri alba, and other good things. Sophro-lælia Psyche and Sophro-lælio-cattleya Olive (A.M.) were very handsome, and both were shown by Mr. Davis, gardener to J. Gurney Fowler, Esq., The Glebelands, South Woodford.

Mr. Day, gardener to H. S. Goodson, Esq., Putney, had a fine group of orchids, composed largely of odontoglossums, Cymbidium Lowianium, an odontioda, and numerous forms of Cattleya Trianæ. Sophronitis grandiflora and dendrobiums shown by Messrs. J. Cypher and Sons, Cheltenham, made up a handsome display, together with fine forms of Cattleya Trianæ, C. intermedia alba, and a few choice cypripediums. A fine display of odontoglossums was arranged by Messrs. J. and A. McBean, Cooksbridge, Sussex, who made a feature of light varieties.

A handsome group of orchids, set up by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, contained Dendrobium nobile virginale, D. Brymerianum, Cymbidium Holfordianum, the rare Cœlogyne pandurata, Odontoglossum Loochristiense, and other interesting and beautiful kinds. A number of very beautiful odontoglossums, unnamed, were submitted by Mr. M. Mertens, Mont St. Amand, Ghent. Messrs. Moore, Lim., Rawdon, Leeds, showed a collection of dendrobiums, with Odontoglossum Loochristiense, O. triumphans, and other choice things. Mr. A. W. Jensen, Lindfield, Haywards Heath, contributed a bold exhibit of Cattleya Trianæ in great variety, and a number of odontoglossums. Messrs. Sander and Sons, St. Albans, had a small display of orchids, that included several good varieties of Lycaste Skinneri.

DAFFODIL COMMITTEE.

Messrs. Cartwright and Goodwin, Kidderminster, contributed a charming exhibit of early daffodils, arranged in vases, with isolepis between the vases. Among the many delightful varieties so prettily presented we made special note of Queen of Holland, D[illegible]loon, Evangeline, Mdme. de Graaff, Chaucer, Corden, Salamander, Hamlet, White Lady, Beauty, Victoria, Sunset—a pretty variety, Alton Lock, and Autocrat.

A charming display of daffodils, tulips, and violets was well arranged, with a few crocuses, by Messrs. R. H. Bath, Lim., Wisbech, and the great feature of the display was that the tulips and daffodils were all grown in ornamental bowls, in fibre and shell; Vermilion, Brutus, Gris de Lin, Van der Neer, White Joost van Vondel, and Prince of Austria were all fine for this purpose. Marian, a new poet's narcissus, was also a striking feature of this exhibit. Messrs. Barr and Sons, Covent Garden, submitted an exhibit of Darwin tulips, all very beautiful; a selection of early daffodils and a very pretty little group of Iris reticulata, hellebores, crocuses, saxifragas, and other early flowers.

FRUIT AND VEGETABLE COMMITTEE.

There was only one competitive exhibit of vegetables, and this was from Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, who was awarded first prize for the Sutton rhubarb, mushrooms, Perfection asparagus, Canadian Wonder dwarf bean, Sutton's Christmas Salad chicory, and seakale—all finely shown. Mr. A. Poupart, Marsh Farm, Twickenham, showed fine heads of Poupart's Selected seakale.

Mr. J. Poupart, Rainham, Essex, contributed splendid forced asparagus, seakale, and Linnæus, Victoria, and Champagne rhubarb—finely set up. Miss Dixon, Elmcroft, Chichester, showed forced Royal Sovereign strawberries in fairly good condition.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Pteris aquilina congesta, from Messrs. H. B. May and Sons, Edmonton.

Award of Merit. — To H.T. Rose Rhea Reid, from Mr. G. W. Piper, Uckfield.

To Begonia Saturne, from Messrs. H. Cannell and Sons, Swanley.

To Crocus Sieberi versicolor, from Mr. G. Reuthe, Keston.

To Carnation Rose Doré, from Mr. Lancashire, Guernsey.

To Cineraria stellata, cactus-flowered strain, from Messrs. Sutton and Sons, Reading.

To Brasso-cattleya Digbyano-Mendeli var Perfecta, from Lieut.-Colonel Holford, Westonbirt, Tetbury.

To Dendrobium Schneiderianum Westonbirt variety, from Lieut.-Colonel Holford.

To Sophro-lælio-cattleya Olive, from Gurney Fowler, Esq., Glebelands, Wood

MEDALS.

Silver-Gilt Flora.—Messrs. J. and McBean, Cooksbridge, Sussex, for [illegible]; Messrs. Hugh Low and Co., Enfield, [illegible] nations; Messrs. J. Veitch and Sons, [illegible] for rhododendrons and greenhouse [illegible]

Silver-Gilt Banksian.—Mr. W. H. [illegible] Tangley Nurseries, Hampton, for carnations and liliums; Messrs. Paul and Son, Cheshunt, for lilacs; Messrs. Sutton and Sons, Reading, for cinerarias; St. George's Nursery Co., Harlington, Middlesex, for cyclamens; Mr. H. Burnett, Guernsey, for carnations; Messrs. Cartwright and Goodwin, Kidderminster, for daffodils.

Silver Flora.—Messrs. W. Cutbush and Son, Highgate, for carnations and alpines; Mr. L. R. Russell, Richmond, for azaleas, etc.; Messrs. T. S. Ware, Lim., Feltham, alpines; Mr. H. S. Goodson, Putney, orchids; Messrs. J. Cypher and Sons, tenham, for orchids; Messrs. R. H. Bath, Lim., Wisbech, for tulips and daffodils.

Silver Banksian.—Messrs. R. and G. Cuthbert, Southgate, for azaleas; Mr. W. H. Lancashire, Guernsey, for carnations; Messrs. H. Cannell and Sons, Swanley, for begonias; Messrs. J. Cheal and Son, Crawley, for alpines; Mr. A. W. Jensen, Cuckfield, for orchids; Messrs. Sander and Son, St. Albans, for orchids; Messrs. H. Low and Co., Enfield, for orchids; Mons. M. Mertens, Mont St. Amand, Ghent, for orchids; Messrs. Barr and Sons, Covent Garden, for daffodils and tulips.

Silver Knightian.—Mr. J. Poupart, Twickenham, for seakale.

Bronze Flora.—Messrs. J. Peed and Son, Streatham, for alpines and carnations; Mr. G. Reuthe, Keston, for alpines, etc.

Bronze Banksian.—Messrs. Hopkins, Shepperton, for alpines; Miss Dixon, Chichester, for forced strawberries.

Perpetual Flowering Carnation Society.

There was a very pretty exhibition at the Royal Horticultural Hall on March 24, and the carnation flowers shown were on the whole of very fine size and colour. The competition was rather limited; that is to say, the same prizewinners seemed to score all round, only varying their positions occasionally. The society must in some way increase the number of competitors, if further interest is to be created. There was a good representation of the newer varieties, and almost all the carnation specialists were present

GROUPS AND PLANTS.

There was but one exhibit in the class for a group of cut blooms, arranged on a table space of 10ft. by 3ft., and the exhibitor was Mr. Hayward Mathias, Medstead, who set up beautiful vases of Robert Craig, Winsor, White Lawson, Gwladys, Rose Pink Enchantress, Enchantress, Britannia, Mrs. T. W. Lawson, White Perfection, Harlowarden, and Mrs. H. Burnett. This was a splendid exhibit of first-rate blooms; first prize and gold medal.

There was only one group of carnations in pots, arranged on a space of 25 square feet, and this was Mr. A. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, Shenley, who showed Britannia, Enchantress, Mrs. H. Burnett, and Rose Pink Enchantress, all well grown, and finely flowered. The group was well arranged, and nicely finished off with ferns and moss. To this was awarded first prize, and Lord Howard de Walden's fine silver cup.

The best three plants, distinct varieties, were of White Perfection, Britannia, and Mrs. H. Burnett, shown by Mr. J. Vert, who also led in the class for six plants, in six varieties, showing Winsor, Britannia, Mrs. H. Burnett, White Perfection, Robt. Craig, and Hon. G. Fellowes.

THREE DOZEN BLOOMS.

The leading cut flower class was for three dozen flowers of a variety, and here some grand vases were displayed. In the white class Mr. W. H. Lancashire, Victoria Nursery, Guernsey, won first place with White Perfection; the Newport Carnation Nursery Co., second with White Perfection. For a blush variety Mr. Lancashire led with Enchantress; Mr. W. H. Page, Tangley Nurseries, Hampton, second, and Messrs. Bell and Sheldon third, each with Enchantress. In the light pink, rose, or salmon class, Messrs. Bell and Sheldon scored with Winsor; and Mr. W. H. Lancashire second with Mrs. H. Burnett. Mr. W. H. Lancashire scored in the deep pink or cerise class with Mrs. T. W. Lawson in fine form; Mr. Engelmann second with Afterglow. Mr. C. Engelmann led with a crimson variety with his new Carola, and Mr. W. H. Lancashire second with President in good condition

In the scarlet class, the Newport Carnation Nursery Co. won first place with good blooms of Victory, but the stems were rather slender; Mr. W. H. Lancashire second with Robert Craig, and Mr. C. Engelmann third with Andrew Carnegie. In the fancy class Mr. C. Engelmann was placed first with Jessica, and in the class for a dozen blooms of a variety not in commerce, Mr. Engelmann led with his deep maroon Carola. For three vases, each containing a dozen flowers, and representing three American novelties, Messrs. Bell and Sheldon, Guernsey, led with Afterglow, Aristocrat, and Winsor; Mr. A. F. Dutton second with Winsor, Victory, and Rose Pink Enchantress; Mr. C. Engelmann third with Afterglow, Victory, and White Enchantress.

DENDROBIUM SCHNEIDERIANUM WESTONBIRT VARIETY.

Exhibited by Lieut.-Colonel Holford at R.H.S. Meeting on Tuesday last, when it received an Award of Merit. Flowers large, the petals and sepals soft rose purple, the lip rich orange.

EIGHTEEN BLOOMS.

In the section where the number of blooms required was eighteen in a vase, Mr. C. Engelmann, Saffron Walden, led for a blush carnation with Enchantress, Mr. D. M. Collins, Heathfield Nursery, Swanley, second, and Messrs. B. and V. Haig, Castle Hill Nursery, Maidenhead, third, each with the same variety. For a light pink, rose, or salmon variety Mr. A. F. Dutton, Iver, Bucks, was first with Rose Pink Enchantress in fine form; and Mr. C. Engelmann second with Welcome. For a deep pink or cerise variety Messrs. Bell and Sheldon, Guernsey, gained premier honours with a fine vase of Afterglow; the Newport Carnation Nursery Co., Newport, Essex, second, with Mrs. T. W. Lawson; and Mr. A. F. Dutton third with Pink Imperial. Messrs. Bell and Sheldon scored for a crimson variety with fine flowers of President; Mr. A. F. Dutton second; and Mr. W. H. Page, Hampton, third with Governor Roosevelt.

Messrs. Bell and Sheldon also led for a scarlet variety, with Britannia, and Mr. D. M. Collins second with the same variety. The Newport Carnation Nursery Co. led for a fancy variety with Jessica in fine form, and Mr. A. F. Dutton came second with the bright red-flaked Imperial. Messrs. Bell and Sheldon scored for eighteen flowers of a white variety with wonderfully fine specimens of Lady Bountiful; Mr. C. Engelmann second with White Perfection, and Mr. A. F. Dutton third with Dutton's White Lawson.

GARDENERS AND AMATEURS.

In this section, three flowers of a variety were, in most cases, required. Mr. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, scored for a white variety with White Enchantress; Mr. A. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, second with Sarah Hill; and Mr. A. T. Paskett, gardener to C. J. Johnstone, Esq., Burs Wood, third with White Perfection. Mr. Vert led for a blush variety with Enchantress; Mr. Usher and Mr. A. F. Paskett, second and third respectively, each with the same variety. In the class for a light pink, rose, or salmon variety, Mr. Vert was again to the fore, with Mrs. H. Burnett, finely shown; Mr. J. G. Weston, gardener to H. J. King, Esq., Ashford, second with Mrs. H. Burnett; Mr. A.

E. Usher third with Winsor. In the deep pink or cerise class Mr. J. G. Weston led with Nelson Fisher; Mr. Paskett second with Pink Imperial; and Mr. J. Vert third.

For a crimson variety Mr. J. Vert scored with Harlowarden; Mr. Usher second with Harlowarden; and Mr. Paskett third with President. In the scarlet class Mr. Usher led with beautiful flowers of Beacon; Mr. Paskett second. In the fancy class Mr. Usher scored with Imperial, and Mr. Vert was second with Marmion, and Mr. Weston third with Jessica.

Dr. Kyffin offered a prize for the best vase of a dozen blooms, in six varieties; there were five entries, Mr. Usher leading, and followed by Mr. Vert and Mr. Paskett in the order of mention. Messrs. Low and Co.'s special prize for four varieties, four blooms of each, in one vase, was won by Mr. A. T. Paskett.

DECORATIVE EXHIBITS.

Premier award for a table decoration was won by Mr. J. Agate, Havant, with pale pink flowers of Fair Maid; Mrs. A. Robinson, Norhyrst, Park Hill, Carshalton, second, using the same variety; and Mrs. F. Robinson, 82, Princes Street, Dunstable, third with Enchantress. For a decorative vase of blooms, Messrs. Bell and Sheldon led with a delightful arrangement of Mrs. H. Burnett; Mr. W. M. Collins second, and Mr. A. F. Dutton third. Mr. Paskett was the only exhibitor of a basket of blooms, and he was awarded a first prize. Messrs. R. F. Felton and Sons, Hanover Square, led for a bouquet of carnations with a very pretty design in flowers of Mrs. H. Burnett; Messrs. Bell and Sheldon second, and Messrs. B. and V. Haig third. Mr. Usher scored for three ladies' sprays, and was followed in order by Messrs. B. and V. Haig and Mr. J. Agate, in order of mention. Mr. Usher and Mr. Agate were first and second respectively for six gentlemen's buttonhole bouquets.

NON-COMPETITIVE.

The fine central exhibit from Messrs. Hugh Low and Co., Enfield, was a great attraction, and among the many fine varieties represented in vases and baskets of various sizes, we made note of the new deep maroon Black Chief, Britannia, Mrs. H. Burnett, Enchantress, Mikado, Autocrat, Mrs. T. W. Lawson, Marmion, Rose Pink Enchantress, Aristocrat, Beacon, Afterglow, and White Perfection (silver-gilt medal).

A large and very interesting display of carnations was set up by Mr. C. Engelmann, The Nurseries, Saffron Walden, who filled the side of one long table with beautiful blooms. The only weak point was the somewhat obtrusive tin tubes the flowers were shown in. Rose Pink Enchantress, White Perfection, Britannia, Winona, Melody, Mrs. T. W. Lawson, Carola—deep crimson, Mrs. H. Burnett, Red Riding Hood, The Marquis, Mikado, and Beacon were the leading varieties. (Gold medal).

Mr. H. Burnett, Guernsey, added to his exhibit of the previous day, and showed grand blooms of Mrs. Burnett, Marmion, the yellow Fortuna, Aurora, Mikado, and the scarlet Defiance. (Gold medal). Messrs. W. Cutbush and Son, also increased their carnation display, and, in addition to popular varieties, they showed the fancy Glendale, the deep maroon purple Lady Nora Brassey, the pink Lady Miller, and a number of interesting new seedlings. (Silver medal).

A group of very finely-grown plants of Britannia, Rose Pink Enchantress, Jessica, White Perfection, etc., was shown by Mr. J. Vert, and a silver medal was awarded.

Several exhibits were kept over from the previous day, notably Messrs. Hugh Low and Co.'s acacias; Messrs. W. Cutbush and Sons' shrubs and alpines; Messrs. A. and J. Clarke's rock garden; Mr. L. R. Russell's forced azaleas, etc.; Messrs. Cartwright and Goodwin's daffodils; Messrs. H. B. May and son's ferns, boronias, and cinerarias; Messrs. J. Cheal and Son's rock garden; Messrs. R. H. Bath, Lim., daffodils and tulips grown in fibre; Mr. W. H. Page's display of liliums and carnations (silver-gilt medal); Messrs. J. Peed and Son's carnations (silver medal); and Mr. W. H. Lancashire's carnations (silver medal).

No new varieties gained certificates or awards, but the committee desired to see Messrs. H. Low and Co.'s Black Chief again.

Beckenham Horticultural Society.

On Friday the 12th inst., before the above society, Councillor James Crease presiding, Mr. J. B. Hunter, of Elmhurst Gardens, Bickley, gave an eminently practical discourse on "Vegetable Culture." The lecturer dealt chiefly with those kinds of vegetables that figure on the exhibition table, but gave excellent advice both for securing prize-winning samples and for home supplies. The preparation of the soil, manuring, etc., was emphasised. A formula given by Mr. Hunter for artificial manures to be mixed at home was: 1 part bonemeal, 1 part superphosphate, 1 part kainit, and a ½ part of basic slag, forking this into the soil, and following later with slight dustings of nitrate of soda. It was stated by Mr. Crease, who is a prominent tradesman of Beckenham, "that it is 25 years since the country was so denuded of green vegetables as now. Even onions are very scarce and making high prices." One member reported a good breadth of asparagus kale practically uninjured by the severe weather. Mr. Hunter thought that winter greens were sown far too early. Discussion was well maintained, and was very instructive.

Croydon Gardeners' Association.

At the recent meeting of this association Mr. P. E. Bunyard, F.Z.S., gave an interesting lecture on his trip to North Uist last summer for the purpose of studying the bird life of this comparatively small island. Mr. Bunyard gave much interesting information on the birds and their nests and eggs that came under his observation, and referred to the great breadth of the double white narcissus that he met with.

A hearty vote of thanks was accorded Mr. Bunyard at the close of his lecture.

Cardiff Gardeners' Association.

The fortnightly meeting of the above association was held at St. John's Schools on the 16th inst. Mr. Mountney, vice-chairman, presided over a good attendance, and an excellent lecture was given by Mr. A. Cobb, The Dyffryn Gardens, Cardiff, on "Summer Bedding." The various methods which are adopted in this class of work was practically explained, and much useful information was given on the subject. The lecturer described the proper way to make the flower garden attractive during the summer, and dealt with carpet, subtropical, and miscellaneous bedding. Mr. Julian proposed, and Mr. Lewis seconded, a hearty vote of thanks to Mr. Cobb for his interesting lecture.

ONE PENNY WEEKLY, by post 1½d.

FARM AND GARDEN

THE DAIRY—POULTRY—PIGS—LIVE STOCK—ALLOTMENTS—MARKET GARDENING, etc.

This week's issue (Mar. 27) contains the following:
FIRST MILK AFTER CALVING.
IMPROVING THE DAIRY HERD.
SOFT CHEESE MAKING.
FOOT-ROT IN SHEEP.
SCOUR IN CALVES.
EXCESSIVE HAIR IN SHIRES.
SOWING PASTURES.
FIELD PEAS.
HOW TO MAKE A POULTRY HOUSE.
EARLY DUCKLINGS.
MARKET GARDEN NOTES.
MANURING VEGETABLES.
THE SEED BED.
RABBIT KEEPING.

SOLD BY ALL NEWSAGENTS.

OFFICES: 148 and 149, ALDERSGATE STREET, London.

RED OR GRIZZLY GRAPES.

I have been especially interested in the discussion that has recently appeared in the GARDENERS' MAGAZINE relative to the merits of the good old Grizzly Frontignan and other grizzly grapes. I have a very vivid recollection of enjoying (some sixty years ago) many a feast of the luscious, rich, and unique flavour of Grizzly Frontignan. [illegible] there is no other grape, so far as I am aware, exactly like it in that respect; in fact, it is a veritable fondant morceau, and, as Mr. Charles E. Pearson significantly observes, "it does not cloy on the palate," as the Muscat does, with its musky aroma. Its comparatively small size, and, with some, its colour, is an objection. To myself, however, the colour was ever attractive.

As another instance of the Grizzly Frontignan's peculiar quality, it was my duty and pleasure, many years ago, to cultivate and furnish the breakfast table every morning while the crop lasted with a dish of "Grizzly," and also of the now rarely-grown Hautbois strawberry when in season. Curiously, however, after the season was over with both the varieties of fruits indicated, no other variety was requisitioned to succeed them at the breakfast table, hence indicating that it was for the sake of the unique flavour alone that they were patronised. In conclusion, I may remark that a comparatively light textured soil, well drained, is necessary for the successful culture of the Grizzly Frontignan, as it is prone to "shank" in a heavy and wet medium.

WILLIAM GARDINER.

Birmingham.

I have read with much interest the remarks of the several writers on the Grizzly Frontignan grape, and I cannot refrain from joining with the majority of your correspondents in speaking in praise of its flavour. I would mention, as a matter of some interest, that last autumn, before the discussion began, I rooted out several of the newer favourites to make room for the Grizzly Frontignan. I readily admit that the bunches are not equal in appearance to those of the Muscat of Alexandria, but I am not the less strongly convinced that the Grizzly Frontignan is one of the best. The exquisite flavour has so greatly impressed me that no friend of long acquaintance will, by heated argument, remove my impression.

Wareham. W. D. POPE.

FORTHCOMING ENGAGEMENTS.

TUESDAY, March 30.—Cornwall Daffodil Show, at Truro; two days.

THURSDAY, April 1.—Linnean Society meets.

FRIDAY, APRIL 2.—Berlin International Horticultural Exhibition; April 2—13.

SATURDAY, April 3.—French Horticultural Society of London.

TUESDAY, April 6.—Royal Horticultural Society: Narcissus Committee, at 11.30 a.m.; Orchid, Floral, and Fruit Committees, at 12 o'clock; lecture at 3 p.m. on "Effects of the [illegible] Growth," by Rev. Professor G. Henslow; Scientific Committee, at 4 o'clock.
British Gardeners' Association, Council Meeting.

WEDNESDAY, April 7.—Royal Caledonian Horticultural Society's Spring Show; two days.
Royal Society of Arts meets.

THURSDAY, April 8.—Liverpool Horticultural Association's Spring Show.

FRIDAY, April 9.—Good Friday.

MONDAY, April 12.—Easter Monday.

SATURDAY, April 17.—[illegible] Spring Show.

TUESDAY, April 20.—Royal Horticultural Society: Narcissus Committee, at 11.30 a.m.; Floral, and Fruit Committees, at 12 [illegible]; lecture at 3 p.m. on "Pansies," by Mr. [illegible] D.Sc.; Scientific Committee, at 4 [illegible].
Devon Daffodil Show, at Plymouth; two days.
Shropshire Horticultural [illegible].
National Auricula and Primula [illegible] Horticultural Hall.

WEDNESDAY, April 21.—Royal Horticultural Society of Ireland, Spring Show, at Dublin.
Ipswich Spring Show.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

ROSE ARMOSA.—F. J. C., Poole: This is a Bourbon rose, and its correct name is Hermosa. It is very free-flowering, and has all the freedom of a China rose. It makes a low, spreading bush about 2ft. high, and bears rosy-pink flowers. Prune moderately at the end of March.

TRAPPING MOLES.—A further reply to our correspondent, "C. F. A., Kidderminster, has reached us from Mr. W. Chaffer, of Ealing. He writes that he has never heard of a special bait for mole traps, but he rarely fails to catch a mole when the attempt is made. When a mole is found to be working in the garden Mr. Chaffer buries his mole trap in the soil for a couple of days, and then finds the firmest part of the mole's tunnel; it the ground is not very firm he treads it firm and waits for the mole to burrow through again and then sets the trap in the new run. But before setting the trap he coats his hands and the trap with the wettest soil the mole has worked in; on no account should the trap be touched with the naked hands. When a mole is caught it should be well rubbed over the trap, and hands, before resetting, and be kept for a day or two for the same purpose should the trap be thrown without catching a fresh mole.

GOLDEN TRUMPET DAFFODIL FOR FORCING.—S. T. A., Hexham: The best of the bright golden-yellow trumpet daffodils is Golden Spur. It grows well, and flowers freely, good bulbs bearing two or three handsome flowers. It is a splendid daffodil for pot culture and for forcing, and it is also useful for the garden. Golden Spur and Henry Irving are both daffodils of the Maximus type, but whereas the latter variety is not usually a success in any but heavy moist soils, and a genial climate, the others succeed under ordinary conditions.

THE KING AND KING EDWARD SPENCER SWEET PEAS.—G. H., Bath: We are not in a position to say whether these sweet peas are identical, simply because King Edward Spencer is an American variety that has not yet been tested in this country side by side with The King. Both are described as waved forms of King Edward VII., and Mr. Atlee Burpee told us that his King Edward Spencer appeared to be practically the same as The King. The latter is the prior name, supposing the varieties to prove identical. Grow them both, quite near each other, so that you may the more easily make comparisons.

PROPAGATION OF COLEUS THYRSOIDEUS.—M. M., Oxford: As the plants go out of flower keep them slightly drier at the roots for a week or so, and then cut them back and put them in a warm house, or pit, where, under the influence of heat and moisture, they will soon break into new growth, providing cuttings that will root readily if inserted singly in small pots of sandy soil. After they have rooted and been once potted the young plants must receive cooler treatment.

DESTRUCTION OF VERMIN.—Most gardens are pestered with Rats and Mice. Every effort should be made to exterminate them before seeds are sown. Danysz Virus is first rate stuff for killing these vermin. Single tube, 2s., three tubes, 5s. Post free from DANYSZ VIRUS, LTD., 52, Leadenhall Street, [illegible] Dept. London, E.C.—[Advt.]

SHRUBBY CALCEOLARIAS.—S. R. K., Tewkesbury.—You should at once prepare a bed of pretty rich soil in a frame, and in this plant the young calceolarias from four to six inches apart. Keep them close for a few days and then admit air, quickly increasing the amount so that in all but frosty and wet weather the lights can soon be entirely removed. By following this method you will obtain fine, well-rooted plants for putting out where they are to flower at the end of April or early in May. It may be desirable to pinch out the growing points as soon as the plants have become established in the frames, but this depends upon the size of the plants and the purpose for which they are required. Good loam, mixed with old hotbed material, and sand, provides an excellent compost for the calceolarias. Treated in this way, and planted out of doors early, there will be scarcely a gap in the beds or borders, and you will be free from that dreadful collapse that follows semi-starvation and late planting.

SWEET PEAS.—M. E. M., Yarmouth: Put some twigs in the pots for the plants to cling to. There is no need for hurry in planting, unless the plants are very tall and the pots very full of roots, and even in such a case we should prefer to give weak soot-water, or weak liquid manure once a week rather than plant out now. The second week of April will be early enough for planting.

GRAFTING.—B. B., Winchester: You may proceed with the work of grafting at once, and for your purpose the method known as rind-grafting will be most suitable. About three grafts to each branch will suffice; cut the grafts so that there is a little shoulder to rest upon the top of the stock, and be sure that the inner bark of scion and stock are in contact one with the other.

NUMBER OF FRUITS AND VEGETABLES PER DISH.—As yours is an amateur society we suggest you follow the regulation of the National Amateur Gardeners' Association in this matter. It is as follows: "In exhibiting vegetables and fruits for competition the following regulation as to number must be observed unless otherwise stated in the schedule:—Tomatoes and potatoes, 6 of each; broccoli, cabbage, cauliflower, celery, kale, lettuce, 3 of each; Brussels sprouts, beans, and peas, 25 of each; cucumbers and vegetable marrows, 2 of each; beet, carrots, leeks, onions, parsnips, turnips, 6 of each; melon, 1; grapes, 2 bunches; peaches, nectarines, 3 of each; apples, pears, quinces, 5 of each; apricots, figs, 6 of each; plums, 9; damsons, 15; medlars, 10; strawberries, 15; gooseberries, 20; currants, 20 bunches; cherries, raspberries, blackberries, loganberries, mulberries, and nuts, 25 of each."

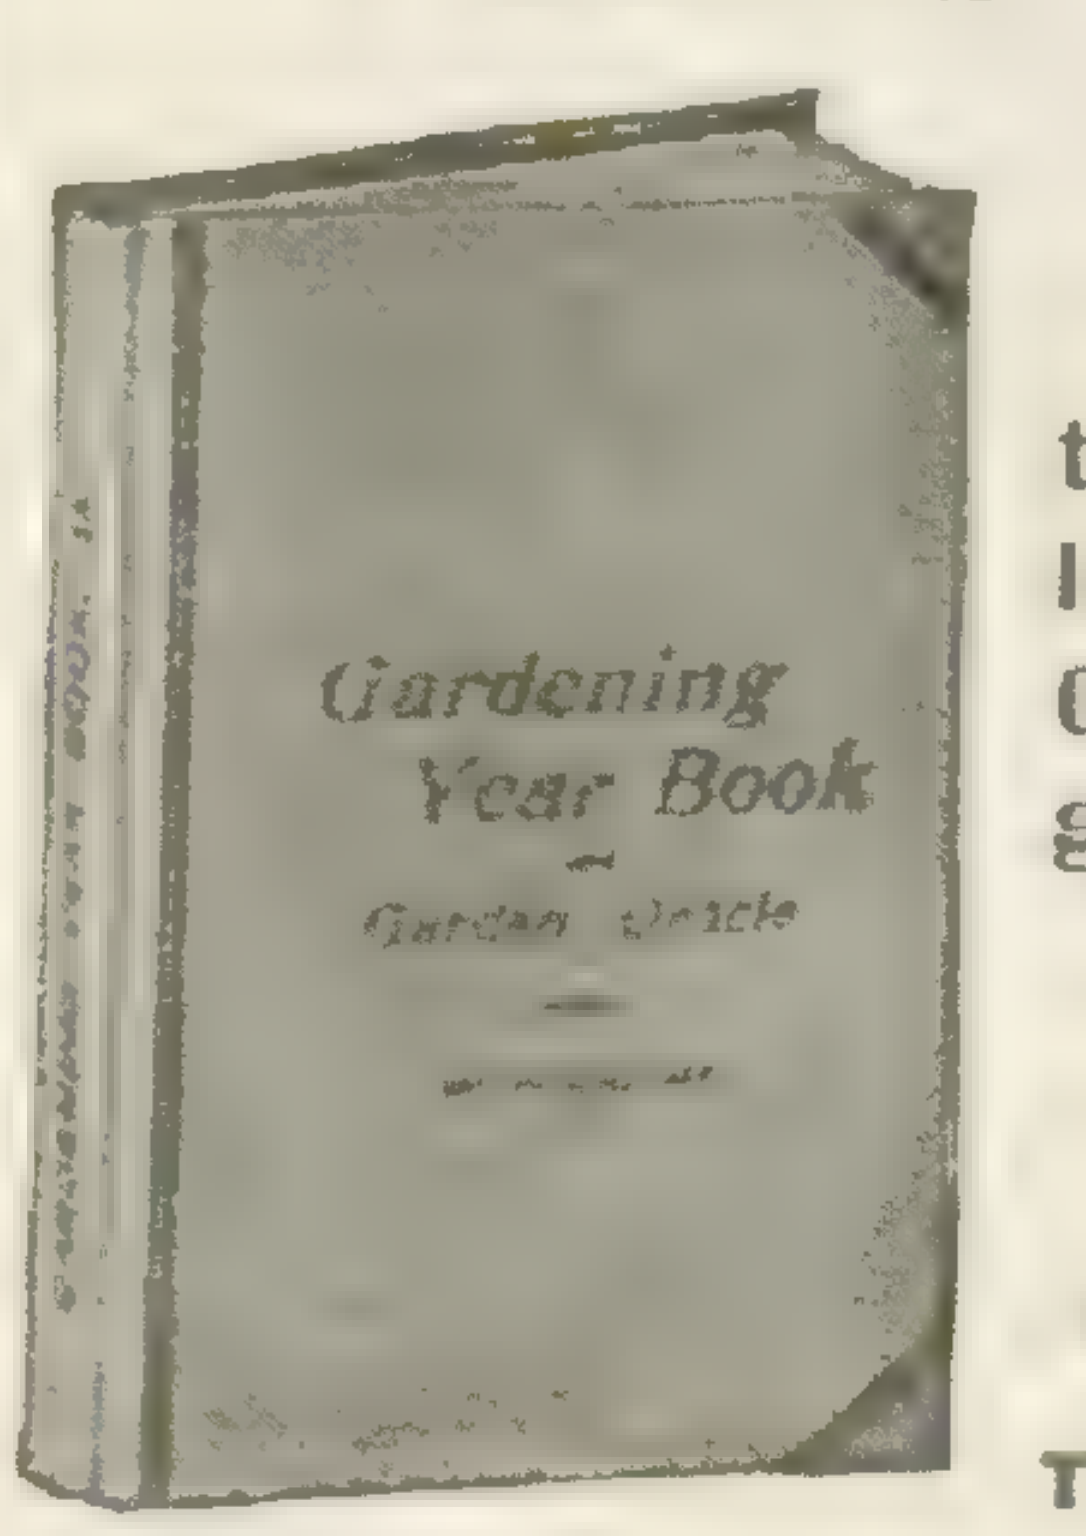
THE
GARDENING
YEAR BOOK,
1909.



A store of practical information on Indoor and Outdoor Cardening, and the general culture of Flowers, Fruits, Vegetables, Orchids, etc.

MANY ILLUSTRATIONS
AND
TWO COLOURED PLATES.

Publ'shed at THE GARDENERS' MAGAZINE Office
148 & 149, Aldersgate Street, London.

NAMES OF PLANTS.

Under this heading we can only undertake [illegible] species and well marked varieties of plants [illegible] not florists' flowers. Specimens should be [illegible] in stout boxes with damp (not wet) moss [illegible] leaves, as packing material, to ensure their [illegible] us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that ferns fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any [illegible] correspondent.

G. B. S., Waterford.—1, Berberis Wallichiana; 2, B. stenophylla; 3, Osmanthus ilicifolius.

W. H., Liverpool.—1, Coleus thyrsoideus; 2, Primula verticillata; 3, Odontoglossum Hunnewellianum.

H. W. P., Guildford.—It is quite impossible to tell the species from the roots, and so we can only help you in a general way. 1 is a phlox; 2, a delphinium; 3, a pæony; 4, an edible asparagus; 5, a solidago; 6, dog's-tooth violet; 7, a pyrethrum.

NAMES OF FRUITS.

When sending fruits for naming will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with [illegible] fruit, whether a separate notification is sent or not. Address the packages to the Editor, Gardeners' Magazine, as advised in the notice at the head of "Answers to Correspondents."

S. E. C., Keswick.—Bellisime d'Hiver.

W. F. M., Newbury.—Mabbot's Pearmain.

J. E. S., Oxford.—Bedfordshire Foundling.

W. S., Taunton.—Baumann's Red Winter Reinette.

F. E. F., Upminster.—1, Bramley's Seedling; 2, Mère de Ménage.

H. B. W., Surbiton.—1, Hawthornden; 2, Baumann's Red Winter Reinette; 3, Winter Majetin.

CATALOGUES RECEIVED.

HUGH LOW AND CO., BUSH HILL PARK, ENFIELD.—A useful and illustrated catalogue of perpetual, Malmaison, and border carnations, the first-named section receiving chief attention.

WM. SYDENHAM, MELBOURNE, DERBYSHIRE.—Four little lists, briefly descriptive of carnations, early-flowering chrysanthemums, violas, and Michaelmas daisies.

CRAVEN NURSERY, CLAPHAM, LANCASTER.—A well-arranged and finely-illustrated catalogue of Alpine and bog and water plants.

WM. COOPER, LIM., OLD KENT ROAD, S.E.—Although the advertisements of this firm's spring clearance sale are wonderful, they only include the leading bargains obtainable. The catalogue shows many more and will be sent on application.

THE PIERSTON GARDEN COMPANY, PIERSTON, GILLINGHAM, DORSET.—A full and interesting catalogue of sweet violets, in which the numerous varieties now in cultivation are concisely described.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page vii.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

"DREADNOUGHT" SEEDS,

The seeds to which this term can be most suitably applied are sent out by Bees Limited,

IN 1d. PACKETS.

They are the product of untold years of the most careful selection, and are grown under the finest possible conditions calculated to produce **seeds of high germinating power** and cropping qualities.

WE DEFY THE WORLD

to produce better plants than can be grown on our Sealand Nurseries. One hundred years ago this land was under water. It was, in fact, part of the bed of a tidal river. For centuries there had been accumulating rich stores of plant food which we have "tapped." Our clients get the benefit in **Plants, Trees,** and **Shrubs** of unwonted vigour, health and hardiness. We take a real pleasure in sending Catalogues post free to all applicants and in answering all manner of enquiries.

IMPROVER (Inside, or Inside and Out); age 17.—H. BURNELL, The Gardens, Kingsmead, Matfield, Kent, highly recommends a strong, willing, and industrious Youth as above; 18 months' experience in present place. Bothy preferred.

IMPROVER seeks SITUATION in good establishment, Inside; four years' experience; good reference; age 18; Bothy preferred. W. WALLER, Labourne Lane, Hascombe, near Godalming, Surrey.

J. COWIE, Gardener to the Honourable Stuart Bouverie, High Barn, Godalming, wishes to recommend his Son, age 17½, as IMPROVER (Inside:) two years' experience in the Gardens of Sir Chas. Metcalfe; strong and willing. Bothy preferred.

WANTED, SITUATION as an IMPROVER, age 17; strong and willing; has had three years and ten months' general experience Inside and Out: total abstainer. Bothy preferred. A. HYLAND, Woodlands, Ticehurst, Sussex.

LADY can highly recommend Gardener to any Lady or Gentleman requiring a good practical, hard-working MAN; thoroughly understands his work, Inside and Out; life experience; leaving through death; 10 years' excellent character; age 34; married, one child, 8 years. W. HIGGINS, The Lodge, Darrington, Camberley, Surrey.

MARRIED MAN (29), one child, seeks SITUATION as KITCHEN GARDENER, used to cows and poultry; good references; also slight knowledge of greenhouse work; willing and obliging. Apply ARTHUR WILLIAMS, Bisbrooke, Nr. Uppingham, Rutland.

MR. COLLINS, Stud House, Hampton Court, wishes to recommend F. COOLING, age 19, as Inside and Out or Kitchen Garden and Pleasure Grounds; 2 years present situation.

MR. M. FEAKES, Lilley, Luton, Beds, will be pleased to recommend H. DAVIS to any Lady or Gentleman requiring a steady, hard-working YOUNG MAN for Kitchen Garden and Lawns; 11 years' experience, Inside and Out; good refs.; abstainer; age 30. H. DAVIS, 42, Lilley, Luton, Beds.

MR. J. SALTER wishes to recommend G. ODDY (27), as a trustworthy and reliable Man; life experience; has been here three years as leading man; Inside and Out; good ref.; abstainer; married, no children. The Gardens, Avenue House, Finchley, N.

THOS. MORRIS, Gardener, Dytchleys, Brentwood, Essex, would be pleased to recommend ALFRED RAINBIRD, age 18½, Inside and Out; 4½ years' experience. Bothy preferred.

YOUNG MAN seeks SITUATION as under Gardener; age 19; Inside and Out; strong and willing. G. LUFF, 18, Prospect Place, Maidstone, Kent.

YOUNG MAN (23), Farmer's Son, seeks SITUATION as UNDER GARDENER, with a good chance for improvement. Good knowledge of kitchen gardening; abstainer; excellent reference. G. SEAR, Hardham, Pulboro, Sussex.

YOUNG MAN (25) seeks SITUATION as UNDER GARDENER (Inside and Out); six years in present place; good references. W. SMITH, Egerton House, Egerton, Ashford, Kent.

YOUNG MAN seeks SITUATION in the Houses under Foreman, in good establishment; age 22; six years' experience; good references and well recommended; Bothy preferred. Apply, A. CHANT, Darby Lodge, Sunbury-on-Thames.

YOUNG MAN (19) seeks SITUATION in Kitchen Garden and Pleasure Grounds; three years present place; well recommended; Bothy preferred. W. DUNK, Great South Hawke, Woldingham, Surrey.

YOUNG GERMAN, 19, experienced in pot Planting, Forcing House, some Agriculture and Vegetable Garden, wants permanent Situation. Could enter any time. Does not know English. Address E. SQUAR GARTNEREI GEBR, Niermann Altrahlstedt, Hamburg.

YOUNG MAN seeks SITUATION; small Nursery, Inside; experience in Chrysanthemums, Tomatoes; Hampshire or near London; low wages for permanency. CHAS. COLES, 199, Camberwell New Road, S.E.

YOUTH, 18, seeks RE-ENGAGEMENT as Third or Fourth, Indoors; or help Out; 4 years outside. Address, Mr. G. FARMER, Head Gardener, Beckford Hall, Tewkesbury.

YOUTH, age 18, seeks SITUATION in good Garden; slight experience; strong and willing; Bothy preferred. H., 138, Silvermere Road, Catford, S.E.

Situations Vacant.

MIDDLESBROUGH EDUCATION COMMITTEE.

LINTHORPE CERTIFIED INDUSTRIAL SCHOOL.

WANTED, a single YOUNG MAN as GARDENER for the above Institution; should be experienced in Inside and Outside work. Preference will be given to one able to instruct the boys in the principles of Horticulture.

The person appointed will be required to take his turn on supervision duty with the other officers. Salary, £40 per annum, with board, lodging, and washing.

Applications stating age, present occupation and experience, together with copies of testimonials to be forwarded to Mr. A. ROBERTSON, Superintendent, Industrial School, Middlesbrough, as early as possible.

J. S. CALVERT,
Secretary.

BLACKMORE and LANGDON'S
BEGONIAS for BEDDING

A GREAT SPECIALITY.

Special Named Doubles for Bedding.

ARGUS.

Makes a carpet of scarlet unequalled by any other bedding plant. **12**/- dozen, **84**/- per 100.

GLADIATEUR.

Rich crimson; very effective. **12**/- dozen, **84**/- per 100

HILDA (New).

Deep salmon, with lighter centre, perfect camellia form vigorous, and of grand habit. **15**/- per dozen.

LORD LANGTON.

Bright scarlet; wonderfully free blooming. **10**/- per dozen, **70**/- per 100.

MARQUIS OF STAFFORD.

Crimson; a well-known and first-rate variety. **12**/- per dozen.

DOUBLE BEGONIAS, Seedling Tubers.

These are of splendid quality, and as our strain possesses an upright habit, which is indispensable in a bedding plant, they are grand for bedding. We offer the following colours: White, blush, pink, rose, scarlet, yellow, orange. **4**/- per dozen, **30**/- per 100. In Mixed Colours, **3**/- per dozen, **21**/- per 100.

SINGLES, Seedling Tubers.

These are of superb quality, and are unequalled for habit and richness of colouring, in the following colours: White, pink, rose, scarlet, yellow, crimson (a special line), and orange, **3**/- per dozen, **21**/- per 100. Mixed—**2/6** per dozen; **15**/- per 100.

FRILLED SINGLE BEGONIAS.

These have created a sensation wherever we have exhibited them the last two seasons. **4**/-, **8**/-, and **20**/- per dozen.

Send for Catalogue of Choice Named and other Begonias, Carnations, Border and Tree Varieties, etc., etc.

Twerton Hill Nursery, BATH.

VOL. LII.—No. 2,892. SATURDAY, APRIL 3, 1909.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Water Gardening.

Time is not yet when the plant lover is likely to be possessed with a strong desire to hasten to the banks of the silent pool or babbling brook to enjoy the exquisite form and colouring of the flowers of water lilies, or to inhale the fragrance of the water hawthorn, or, it may be, to admire the graceful growths of the water flags, or the massive wide-spreading leaves of the gunneras. As we write, the weather is too cold and damp to enable one to become enthusiastic about nymphæas, or indeed, other of the hardy moisture-loving plants; but there are signs of a change in the atmospheric conditions that will be more conducive to the enjoyment of the garden. In any case, it is necessary to remember that, if not now possible to become enthusiastic about the water garden, the time is not far distant when we must give our careful consideration to some at least of the practical details that require attention thus early in the season. If alterations in the formation or the furnishing of the garden are contemplated, plans must be prepared and carried out without delay, so that planting may be done sufficiently early for the several subjects to make their growth in due season. It should not be forgotten that a very decided change in the weather is now due, and that, as in other late seasons, it may be so great as to give an immense stimulus to vegetative activity, and thus render it difficult for those who have fallen behind with their preparatory work to bring up arrears in time for their plants to derive the fullest advantage from warmer conditions. We have now four or five weeks before water lilies need be planted, but not a few of the semi-aquatics which so greatly enhance the charm of a lily pool when tastefully grouped on the margin should be put in their positions before any considerable period has elapsed. Moreover, if it is not desirable to plant the hardy nymphæas until the month of May has given us a foretaste of its delights, it is important to bear in mind that a selection of varieties should soon be made, and everything put in order for planting when the time arrives. We are anxious at the present time to impress upon our readers the desirability of thinking out the various details well in advance, and thus avoid mistakes of a serious character being made, or the risk of delays being incurred that may materially affect the flower production of the water lilies, and, indeed, the general attractions of the water garden for the current year. Water gardening is no longer in its infancy; but much has yet to be accomplished before it can be regarded as a whole quite satisfactory. Many are the gardens in which water lilies and their associates are grown to a high degree of perfection, and so arranged as to produce effects in colour and form that at once appeal to those who are liberally endowed with artistic perceptions. There are also some wherein the accomplishment has fallen short of expectations, owing, it may be, to overlooking some detail seemingly unimportant, but really essential to success. To obtain the fullest enjoyment from the plants under consideration, it is essential the water garden should, both in design and planting, be in full agreement with the environment. This proposition will, to not a few of our readers, appear self-evident; yet, judging from our experience and observation, it is one that cannot well be given too great a prominence whenever water gardening is under consideration. Not only is it necessary that aquatics should be successfully cultivated, but they should be so arranged that they appear to be an essential part of the general scheme. For our present purpose water lily pools and ponds may be arranged in two groups, one natural and the other formal. Both types have their merits and admirers, and which should be selected must be determined by the position the garden will occupy. The natural pool, with its undulating margin and fringe of free-growing plants should certainly not have a place near the house, and especially on a severely formal terrace, for it is so out of keeping with its surroundings as to detract from the general effect and to fail to obtain for its occupants the attention they merit. On the other hand, a formal pond, with architectural embellishments, is wholly out of place when, as in some cases, it is located in the wild garden. It is desirable these incongruities should be avoided, and it may be helpful to state as a general proposition, that formal pools should be near the house and natural water gardens be in a position in the pleasure grounds where a free natural growth is permissible on all sides. Another point is to give full consideration to the fact when making selections, that the nymphæas in cultivation differ materially in growth as well as in the colours of the flowers, and to endeavour to maintain a proper balance between the plants and the pool in which they are grown. In other words furnish pools and ponds of limited area with the smaller forms, and in the furnishing of large ponds and lakes freely utilise the more robust growing kinds. There are some other points to which attention might well be directed, but, in an early issue we shall give special attention to water lilies and other aquatics, when they can be more fully dealt with than is now possible.

MR. JAMES GIBSON.

Mr. James Gibson, head gardener to His Grace the Duke of Portland, at Welbeck Abbey, is a young man who has attained eminence in his chosen profession as a result of whole-hearted attention to business. Mr. James Gibson has some natural advantages over many of his fellows, he is tall and of fine presence, and unfailing good humour. This latter quality has stood him in good stead in the years that have gone, when he was struggling to win name and fame, and when, like others before him, he had to suffer defeat at exhibitions. He smiled at defeat, learned his lesson, and made a braver show next time. It was "over the garden wall" at the Royal Horticultural Society's old gardens at Chiswick that we first made Mr. Gibson's acquaintance; he was then head gardener to Mr. Watts, at Devonhurst, and the garden he had charge of backed on to the R.H.S. Gardens. While not forgetting the ornamental side of gardening, Mr. Gibson was very successful in those days with fruits and vegetables, and his orchard house fruits, in pots, were very fine. Later, Mr. Gibson went to Danesfield, Marlow, the residence of R. H. Hudson, Esq., where he had a large establishment to control, and consequently wider opportunities, all of which he took advantage of. But his great opportunity came when the Duke of Portland needed a head gardener, and Mr. Gibson was selected for the post. We have not seen the Welbeck Gardens since Mr. Gibson took charge, but from many sources we learn of their splendid management under his care. As a competitor Mr. Gibson always tackles the big things, and few who saw it will forget the magnificent fight for supremacy in the great vegetable competition at Edinburgh in 1905, when he was second to Mr. E. Beckett, with 139½ points against 142½, and this when he had been at Welbeck only twelve months. He has turned the scales sometimes since then, but, undoubtedly, Mr. Gibson stands with Mr. Beckett in a class alone, for vegetable culture. Hardy fruits, chrysanthemums, and carnations are other things Mr. Gibson grows superlatively well, but he is a fine all-round gardener with, we hope, long years of success still before him.

Noteworthy Gardens Round Reading.—The district of which Reading is the centre has so long been famous for the number, the importance, the diversity, and the attractions of its gardens, that a sketch of its horticultural aspects cannot fail to prove of much interest to all who are interested in gardening. We have therefore much pleasure in announcing that in our issues for the 10th and 17th inst., we shall give a fully-illustrated account of the more noteworthy of the great gardening establishments in the neighbourhood of Reading. The gardens that will be illustrated and described comprise Aldermaston Court, Bere Court, Caversham Park, Englefield House, Foxhill, Hardwicke House, Hillside, Maple-Durham House, Whiteknights Park, and Wokefield Park.

A Bank of Cyclamen Coum is a novelty, and a very pretty one, though not very strikingly effective. At Kew there is a low bank, near the Orchid Houses, between the head of the T Range and the path that leads past the Cumberland Mound to the collection of hardy ferns. On this low bank some five thousand Cyclamen Coum have been planted, and these are now dotting the grass with their little rosy flowers. They make a pretty scene, and one that the lovers of the rarer, choicer, hardy plants will delight in, but, as an item of garden scenery, they scarcely count. We watched hundreds of people pass within a few yards of the bank without noticing the dainty little flowers of this delightful plant. If the white form were freely associated with the type, and was a success, the effect would be much finer. We hope the experiment, now so promising, will succeed, because we do not want to limit our early spring displays to snowdrops, aconites, crocuses, scillas, and chionodoxas, all of which are very beautiful now in the Royal Gardens.

Gummosis in Lemon.—At the recent meeting of the R.H.S. Scientific Committee, Mr. Worsley showed a branch of a lemon with leaves beginning to shrivel, attacked in a lower portion by gummosis, a considerable mass of gum exuding from the stem, and the bark being browned all round for a considerable distance. It was remarked that, in some cases gumming of trees had been found to be associated with the presence of a fungus, and often appeared to start at a wound, but in the present case no wound could be discerned. In the course of the discussion Sir Daniel Morris said that in Florida the gumming usually occurred in the trees where they had been budded, and Mr. Fawcett said he had seen trees affected in a manner similar to that shown by Mr. Worsley's example in the West Indies, where the disease was thought to be associated with too liberal manuring with nitrogenous manures, or with heaping earth round trees. The disease was treated by cutting out the diseased portion and dressing the wound with tar.

Mr. H. E. Gribble, who has for so many years had charge of the Wynyard Park Gardens, has, we are informed, at the request of the Marquis of Londonderry, taken charge of his lordship's gardens at Seaham Hall also, which he will manage in conjunction with those of Wynyard Park.

Weather in Glasgow. — The meteorological notes and remarks on the weather with reference to its effects upon vegetation that are annually prepared by Mr. James Whitton, superintendent of the Glasgow public parks, are invariably of much interest, and those relating to last year's weather are no exception to the rule. From the notes and remarks on the weather conditions of 1908, which occupy twenty-four 8vo. pages, we learn that during the year there was an absence of very severe frosts and an undue preponderance of easterly winds. The rainfall was considerably below the average, and there was more sunshine and greater warmth, especially in the midsummer months. As the weather of the previous season was not conducive to thorough maturation of growth, there was not the tendency to early growth in the greater proportion of the plants, even had the weather been favourable for early development. Excepting in the case of those plants which are easily excited to growth, and generally regarded as precocious subjects, there was, on account of the dry, cold weather in spring, a slow movement in growth, and, until the third week in May, vegetation was regarded as being about ten days behind the usual time. With the improved weather conditions, however, after that period there was a remarkable development in vegetation, and by the middle of July, it was more forward than it was at the same time of the previous year. Trees and shrubs did not come up to the average in flower production, and the blooming was very erratic and short lived. The later development as to the growth of shoot and foliage was in every sense satisfactory, and as the weather conditions proved favourable for the maturation of growth, trees and shrubs give every promise for a brilliant display in the coming season. Rhododendrons are specially noticeable, they being literally studded with flower buds. The fruit crops in the Glasgow district were considerably below the average, the disastrous frosts on April 24 and 25 having ruined the bush fruits in most places.

National Rose Society.—The high degree of popularity which this society enjoys at the present time is evidenced by the fact that during the past month 126 new members have been added to the list.

Nature Study for Women at Swanley.—At the Swanley Horticultural College for Women a short Nature Study course is being arranged for the period from July 31 to August 14, 1909. Most of the instruction will be given out of doors, under the guidance of experienced teachers. The chief features of the course will be studies in plant life and plant geography, studies in pond life, of insects and birds, and garden lectures and demonstrations, the latter to include such subjects as seed sowing, temperature, propagation, budding, and pruning. For teachers and those training for teachers the fees are materially reduced.

The Alpine House at Kew is at present one of the chief attractions of the Royal Gardens. This span-roofed, unheated house contains early alpine plants in pots and pans, and these are now flowering beautifully, their dainty form and bright colours attracting everyone. Saxifraga apiculata, S. Griesbachi, various muscaris, scillas in variety, Bulbocodium vernum, Iris reticulata, Cyclamen Coum and its white variety, drabas, chionodoxas, corydalis, crocuses, etc., etc., are among the subjects in flower, all anticipating by a little the plants out of doors.

Seakale on the Seashore.—Mr. G. Garner writes: On the seashore near Calshot Castle, and directly opposite the Isle of Wight, seakale grows most luxuriantly without any further attention than that of covering the crowns for blanching purposes early in the spring. The plants grow in the shingle close to the tidal watermark. The roots permeate the shingle and sand below to a depth of from 4ft. to 6ft. In winter time, and during high tides, many plants are quite submerged. There are several acres of shingle covered with seakale, and the flavour of the blanched heads is very much better than that of any garden produce. Very few plants run to seed in summer time.

No Florists There.—The "Weekly Florists' Review" tells the following good story from Mr. W. N. Rudd: "Once upon a time, and not so long ago," says Mr. Rudd, "a party of visitors was being shown through one of the great penitentiaries. Everywhere was spotless cleanliness—not a speck of dirt anywhere; floors [illegible] scrubbed, hand rails polished till they shone, nothing out of place, lawn close cut, great stone buildings one unbroken expanse of gray, and at last the bareness of it all got upon the nerves of the visitors. 'Don't the monotony oppress you?' asked one of the guests. 'Wouldn't it take away the grimness to have some flowers? Why don't you have some window-boxes, and flowers on the lawn? Wouldn't they have an elevating influence on the prisoners, and make your own life less dreary?' 'Yes, they would,' replied the warden, 'and we have often wished we had some flowers, but, you see, while we have men here of almost every occupation and profession, we haven't [illegible] one florist.' "

PRIMROSES AND POLYANTHUSES.

The finer strains of polyanthuses are particularly suitable for large, bold beds, either alone or in conjunction with daffodils or tulips, as one may see each spring at Hampton Court, Kew, Belvoir Castle, and other places where spring displays are a great feature. But this notwithstanding, these delightful spring flowers seem at their best when planted freely along the margins of woodland walks, in great drifts under thinly planted trees, or in irregular masses in the grass along the borders of the pleasure grounds. We have a vivid recollection of splendid breadths of polyanthuses, primroses, and daffodils in the woodland garden at Pridéaux Place, in North Cornwall, and of the wonderful effects produced at Belvoir Castle, and the accompanying illustration shows fine masses of primroses and polyanthuses at Hanley Court, Tenbury, Worcestershire, the residence of Mrs. Wakeman-Newport, who very kindly sent us the photograph from which the illustration was made. It is more than half the battle to obtain a fine strain of these flowers to begin with, and, as there are several excellent strains on the market, no difficulty need arise in this respect. Good plants for putting into their flowering quarters should be secured, and, where the plants are allowed to remain, an annual top-dressing of leaf-mould and old decayed manure works wonders. Where polyanthuses are allowed to remain and naturalise themselves, a sharp look-out should be kept each spring for plants that revert to a poor type in either form, freedom, and colour, and these should be ruthlessly destroyed, or the strain will suffer, and the beauty of the spring display be materially reduced in a few years. Of course, right out in the woods, this matter is of less importance, but it certainly should not be forgotten where the display is near the house or close to much frequented walks.

[Photo: Mrs Wakeman-Newport.

THE "PRIMROSE" GARDEN AT HANLEY COURT, TENBURY.

THE NEW HYBRID TEA ROSE, RHEA REID.

For a long time there was a demand for a really good dark red hybrid tea or tea-scented rose, and when Liberty was introduced in 1900 we thought we had the right thing. Good as Liberty is, it has not the grand habit of Rhea Reid. I grant that Liberty is a deeper and clearer red—almost scarlet in intensity of colour, an exquisite shape, very fragrant, and a free grower under glass, but it is too tender and erratic in growth to become a popular rose in the open.

Five years later (1905) Richmond was sent out. This is decidedly better in growth, but with us it is not so good and deep in colour as Liberty. Its better and more vigorous habit, however, has enabled it to push Liberty on one side, and to quite surpass it as a forcing rose. You can cut Richmond with a much more useful stem than is possible with Liberty, and not feel grieved that so much of the plant is gone.

Rhea Reid was sent out last year by Messrs. E. G. Hill and Co. (the introducers of Richmond), and they gave it a most glowing description: "As large as American Beauty, as double as Bridesmaid, as fragrant as La France, as red as Richmond in winter," etc. American Beauty is not much grown over this side, but Rhea Reid has a decided likeness to it in shape. Rhea Reid is a grand rose, and is almost all that is claimed for it by the raisers, but I think they go a trifle too far when they claim for it the fragrance of La France, although it has much of the sweet perfume found in General Jacqueminot.

Rhea Reid has done well with us. We had plants over early in the spring of 1908, full of growth when they arrived: so much so that buds were taken off and worked upon a few early stocks in the open. These grew, and flowered during the same summer, while the plants that were put in the open border continued in flower almost as late as the dwarfer forms of polyanthas. Under glass, too, it was constant, and it is here, I feel sure, it will be most welcome. It stands remarkably well. As a matter of fact, the fullest blown flower shown at the R.H.S. (when it gained an Award of Merit last week) was a fortnight old.

Earlier in this note I mentioned that Richmond produced good growth for cutting from, but Rhea Reid is much more vigorous. A friend of mine has a quantity under glass—some 4,000 plants—and thinks much of it, but it does not oust Richmond, in his opinion, under glass. It is a little too double, and long in opening for his purpose, nor is it so finely formed in the bud stage as Richmond.

After only one season's growth in the open it is hardly fair to say too much of this rose, but it is a remarkably free and vigorous grower, very floriferous, stands the sun, and lasts well, while that it is very hardy is proved by the way our plants and dormant buds have passed through the late severe weather, and I must say they have stood as well as the most hardy of the hybrid perpetuals.

It is of ideal habit, vigorous, and yet free, not throwing up a few long growths and unbalancing the plants, as so many do, and this will be in its favour as a permanent bedding rose. A. Piper.

Uckfield.

THE CULTURE OF STOCKS IN POTS.

These exquisitely fragrant flowers lend themselves to, and are admirably adapted for pot culture, and they are very desirable subjects for the decoration of the greenhouse or dwelling-rooms in early summer, and by making sowings of the various selections at the proper time we can enjoy their beauty over many months of the year.

The method adopted by the writer with respect to the Ten-week varieties that are usually sown in warmth in early March, is to grow them in rather deep boxes filled with loamy soil, with a liberal addition of cocoa-nut fibre refuse and manure, until they are good and sturdy plants. They are given four or five inches of space in the boxes, and when the plants meet they are lifted with a good ball of roots and transferred to four-and-half-inch and six-inch pots. They are then put in a cold frame, kept close and syringed for about ten days, when the ventilation is gradually increased until the plants are thoroughly hardened. The whole batch is then plunged to the rims of the pots in a warm border, and by keeping them well supplied with water, and giving an occasional dose of nitrate of soda, really splendid plants are produced.

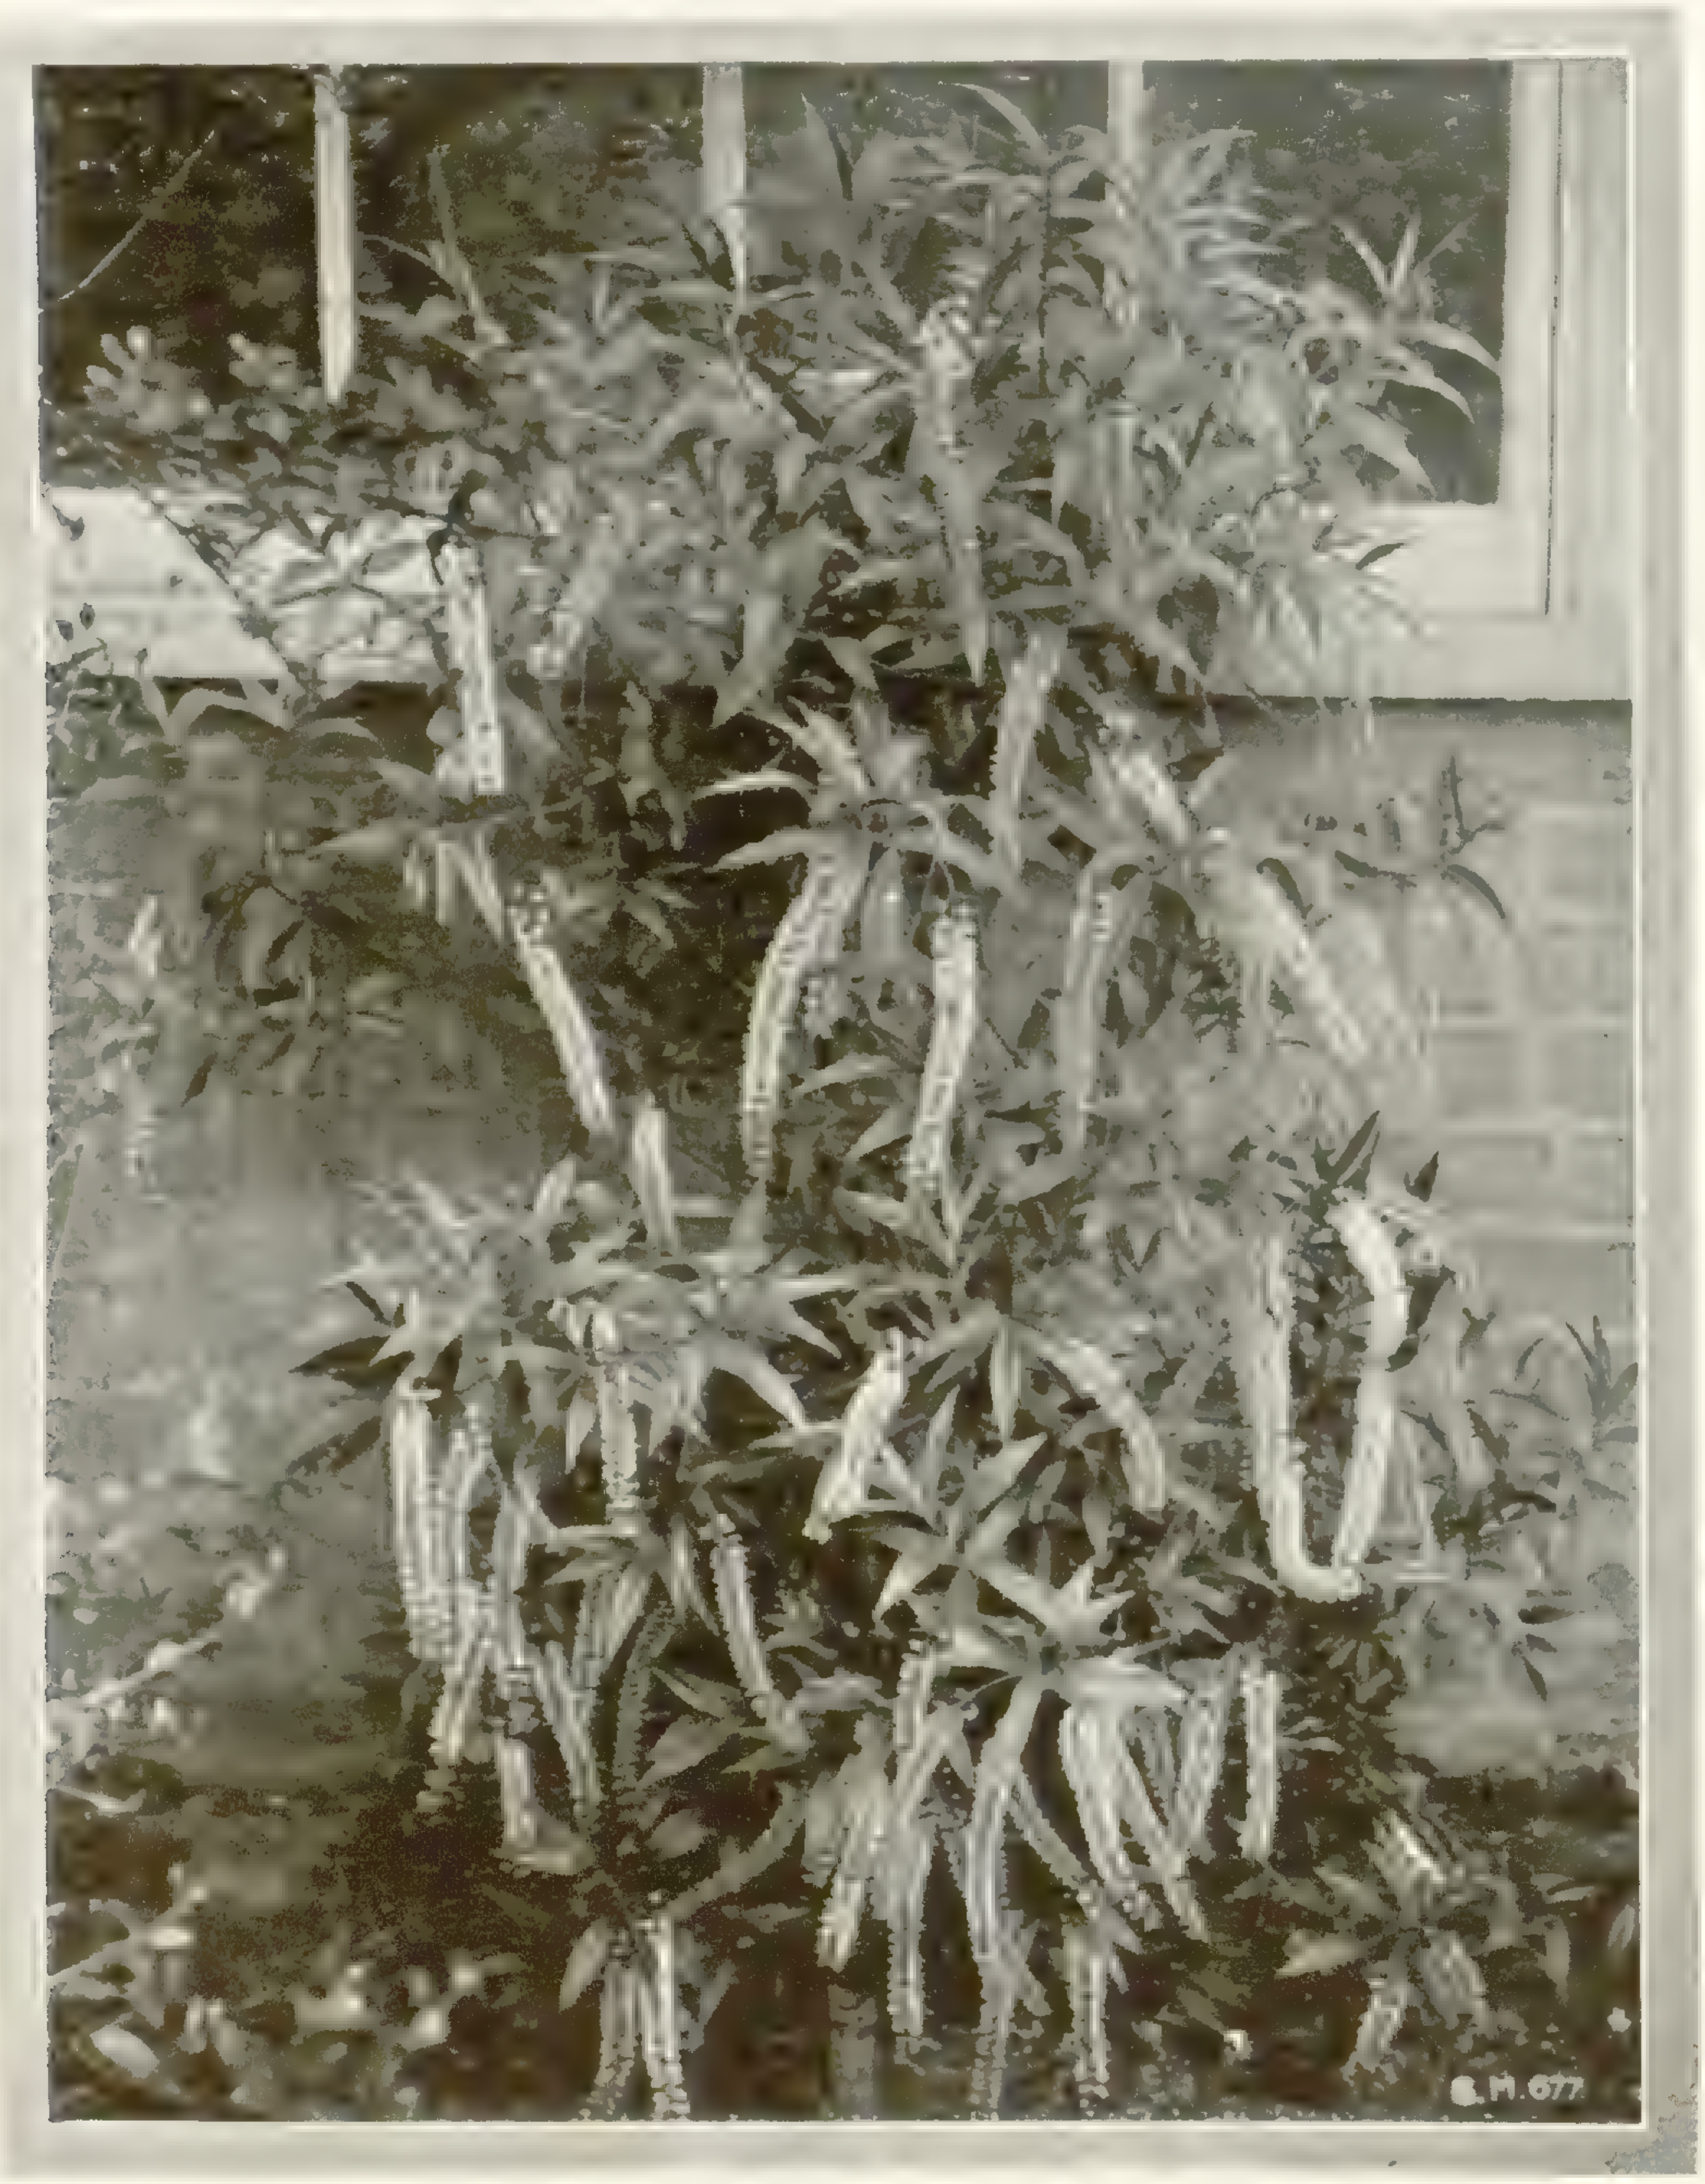
One hardly knows which to recommend as all the varieties are very beautiful. The Dwarf German Ten-week becomes a dense mass of large blossoms. Very fine, indeed, is Carter's Monarch, which throws up a single spike quite two-feet in length, and is clothed with enormous snowy white flowers. Giant Branching is a tall variety with rather thinly arranged branchlets, and, certainly, is second to none either for fragrance or effect.

A sowing of the Intermediate stocks is made early in May in nursery quarters, and as soon as the rough leaf is formed a sufficient quantity is potted into 60-sized pots and placed in a cold frame until established, when they are plunged in narrow beds of ashes. When a fair amount of growth has been made and the roots reach the sides of the pots the plants are transferred to six and seven-inch pots and again plunged in the ashes, where they remain until the end of September. The whole stock is then placed under cover to be drawn upon as desired, and it will be found that if introduced to a genial warmth, say 50 degs., they will hasten into bloom. Beauty of Nice is very fine for this purpose.

Then we have to consider the indispensable Brompton and East Lothian stocks, which are so exceedingly welcome in the early spring, and the same treatment is required, with the exception that the batch is wintered in cold frames, abundance of air being admitted whenever the weather is open. They readily respond to the warmth of an ordinary greenhouse, and should receive liquid manure as soon as growth becomes active. This remark applies to the other sections, and it may be pointed out that it is a huge mistake to select the largest seedlings for any purpose, as the most forward almost invariably turn out to be single, while the (at first) despised weaklings can generally be relied upon to produce double flowers.

Reverting to varieties for a moment, Princess Alice forms a splendid pot plant of somewhat slender growth, the inflorescence being of the purest white, and, further, it is a continuous bloomer. Those who have not yet given it a trial in the open garden and as a bedder, should do so this season. A word as to soil. Good turfy loam with short manure, sand, and a small quantity of lime rubble, will meet their requirements, and fairly firm potting is an essential point in their management.

Walter H. Aggett.



VERONICA SALICIFOLIA IN THE CAMBRIDGE BOTANIC GARDENS.
Flowers bluish-purple, or white.

VERONICA SALICIFOLIA.

In the Cambridge Botanic Garden about forty species of the New Zealand veronicas are grown in a sheltered position, where, with a little extra protection, they withstand our ordinary winters without injury. They are a most interesting set of plants as a collection, varying in form from the curious V. cupressoides and V. lycopodioides to the larger and commoner kinds, such as V. Colensoi and V. Traversi.

Amongst those which prove themselves worthy of being more often seen (at least in the Midlands and South) are V. parviflora, which flowers early in summer, and also during October and November; and V. salicifolia, of which I send a photograph. This plant is about four feet high, and, as the name implies, possesses leaves which much resemble those of the willow. The flowers are produced in great profusion during early summer, in long, catkin-like, drooping spikes of a pale purple colour, these rendering the plant most attractive for a month or six weeks. It is also one of the strongest growing species which recommends it for a trial where a sheltered sunny corner can be found for it. This is the only special consideration it demands in its cultivation, but all of the species stand the winter best in light, well-drained soil.

E J Allard.

CORNUS MAS.

This tall-growing deciduous shrub, which is known in some places under the common name of cornelian cherry and cornel, is less frequently met with in shrubberies and plantations than it ought to be, as it has several qualifications which commend it for general cultivation, especially in the wilder parts of the garden. It is a native of Europe, and will thrive almost anywhere, growing to perfection in both good and poor soil. Under favourable conditions, as regards space, it grows into a large bush 18 to 20 feet high, and upwards of 12 feet through. Its most interesting period is early spring, February or March, according to the mildness or severity of the season, for at that period its branches are starred all over with small heads of tiny yellow blossoms, which make a very pleasing picture on a sunny day. In the case of plants which produce female flowers a further period of interest occurs in summer, when the red, cherry-like fruits are ripe.

In addition to the type there are several well-marked varieties, such as variegata, with silver variegated foliage; aurea elegantissima, with golden-marked leaves; fructa violacea and xanthocarpa, with violet and yellow fruit respectively; and nana of dwarf, compact habit. The appearance of a bush in full flower reminds one of a hamamelis, but the cornus has the advantages of being more easily grown, and of being of value for positions where hamamelis would be out of place.

W. Dallimore.

CACTUS-FLOWERED CINERARIAS.

The florist is always ready to take advantage of any peculiarity presented by flower or plant in a collection of varieties of a recognised type of some popular flower. If the peculiarity suggests a development that is likely to become popular, or, at least, appeal to a considerable number of plant lovers, the florist proceeds to perpetuate the peculiarity. Further, by self-fertilisation, and selection, he will modify or accentuate the peculiarity, as seems most desirable. The frilled begonia recently figured in these pages is one instance of patient work on the part of a florist, and the cactus-flowered cineraria herewith presented is another. In this case Messrs. Sutton and Sons have secured a fine race of elegant cinerarias, of good habit, and in a great variety of colours, but instead of the flowers being regular, and with broad florets, as in the florist's or show type, or producing small, starry blossoms, as in the case of the tall, graceful, and useful Star cinerarias, the flowers are of considerable size, and the florets have their margins rolled, after the fashion of cactus dahlias. There is a peculiar elegance about this race of cinerarias, and as it has become fixed in character there are now three distinct races, or strains, from which to make selection for conservatory decoration. The plant figured was one of several dozens exhibited by Messrs. Sutton and Sons, of Reading, at the recent meeting of the Royal Horticultural Society.

BAMBOOS AND THE PAST WINTER.

Not for many years have bamboos suffered to such an extent as they have since Christmas, and many bamboo gardens about London, and in other places, which at Christmas time could be pointed out as the principal attraction out of doors, became, by the middle of January, possibly the most melancholy feature. This was chiefly due to the blizzard which made its appearance during the latter days of 1908, and to the subsequent frost and cold winds. All kinds have suffered more or less, even such old, well-tried sorts as Arundinaria japonica, or Metake, as it is sometimes called, and Phyllostachys viridi-glaucescens. Some plants look as if a fire had passed over them, drying up all the foliage, for, instead of green leaves, brown, shrivelled foliage is all that remains.

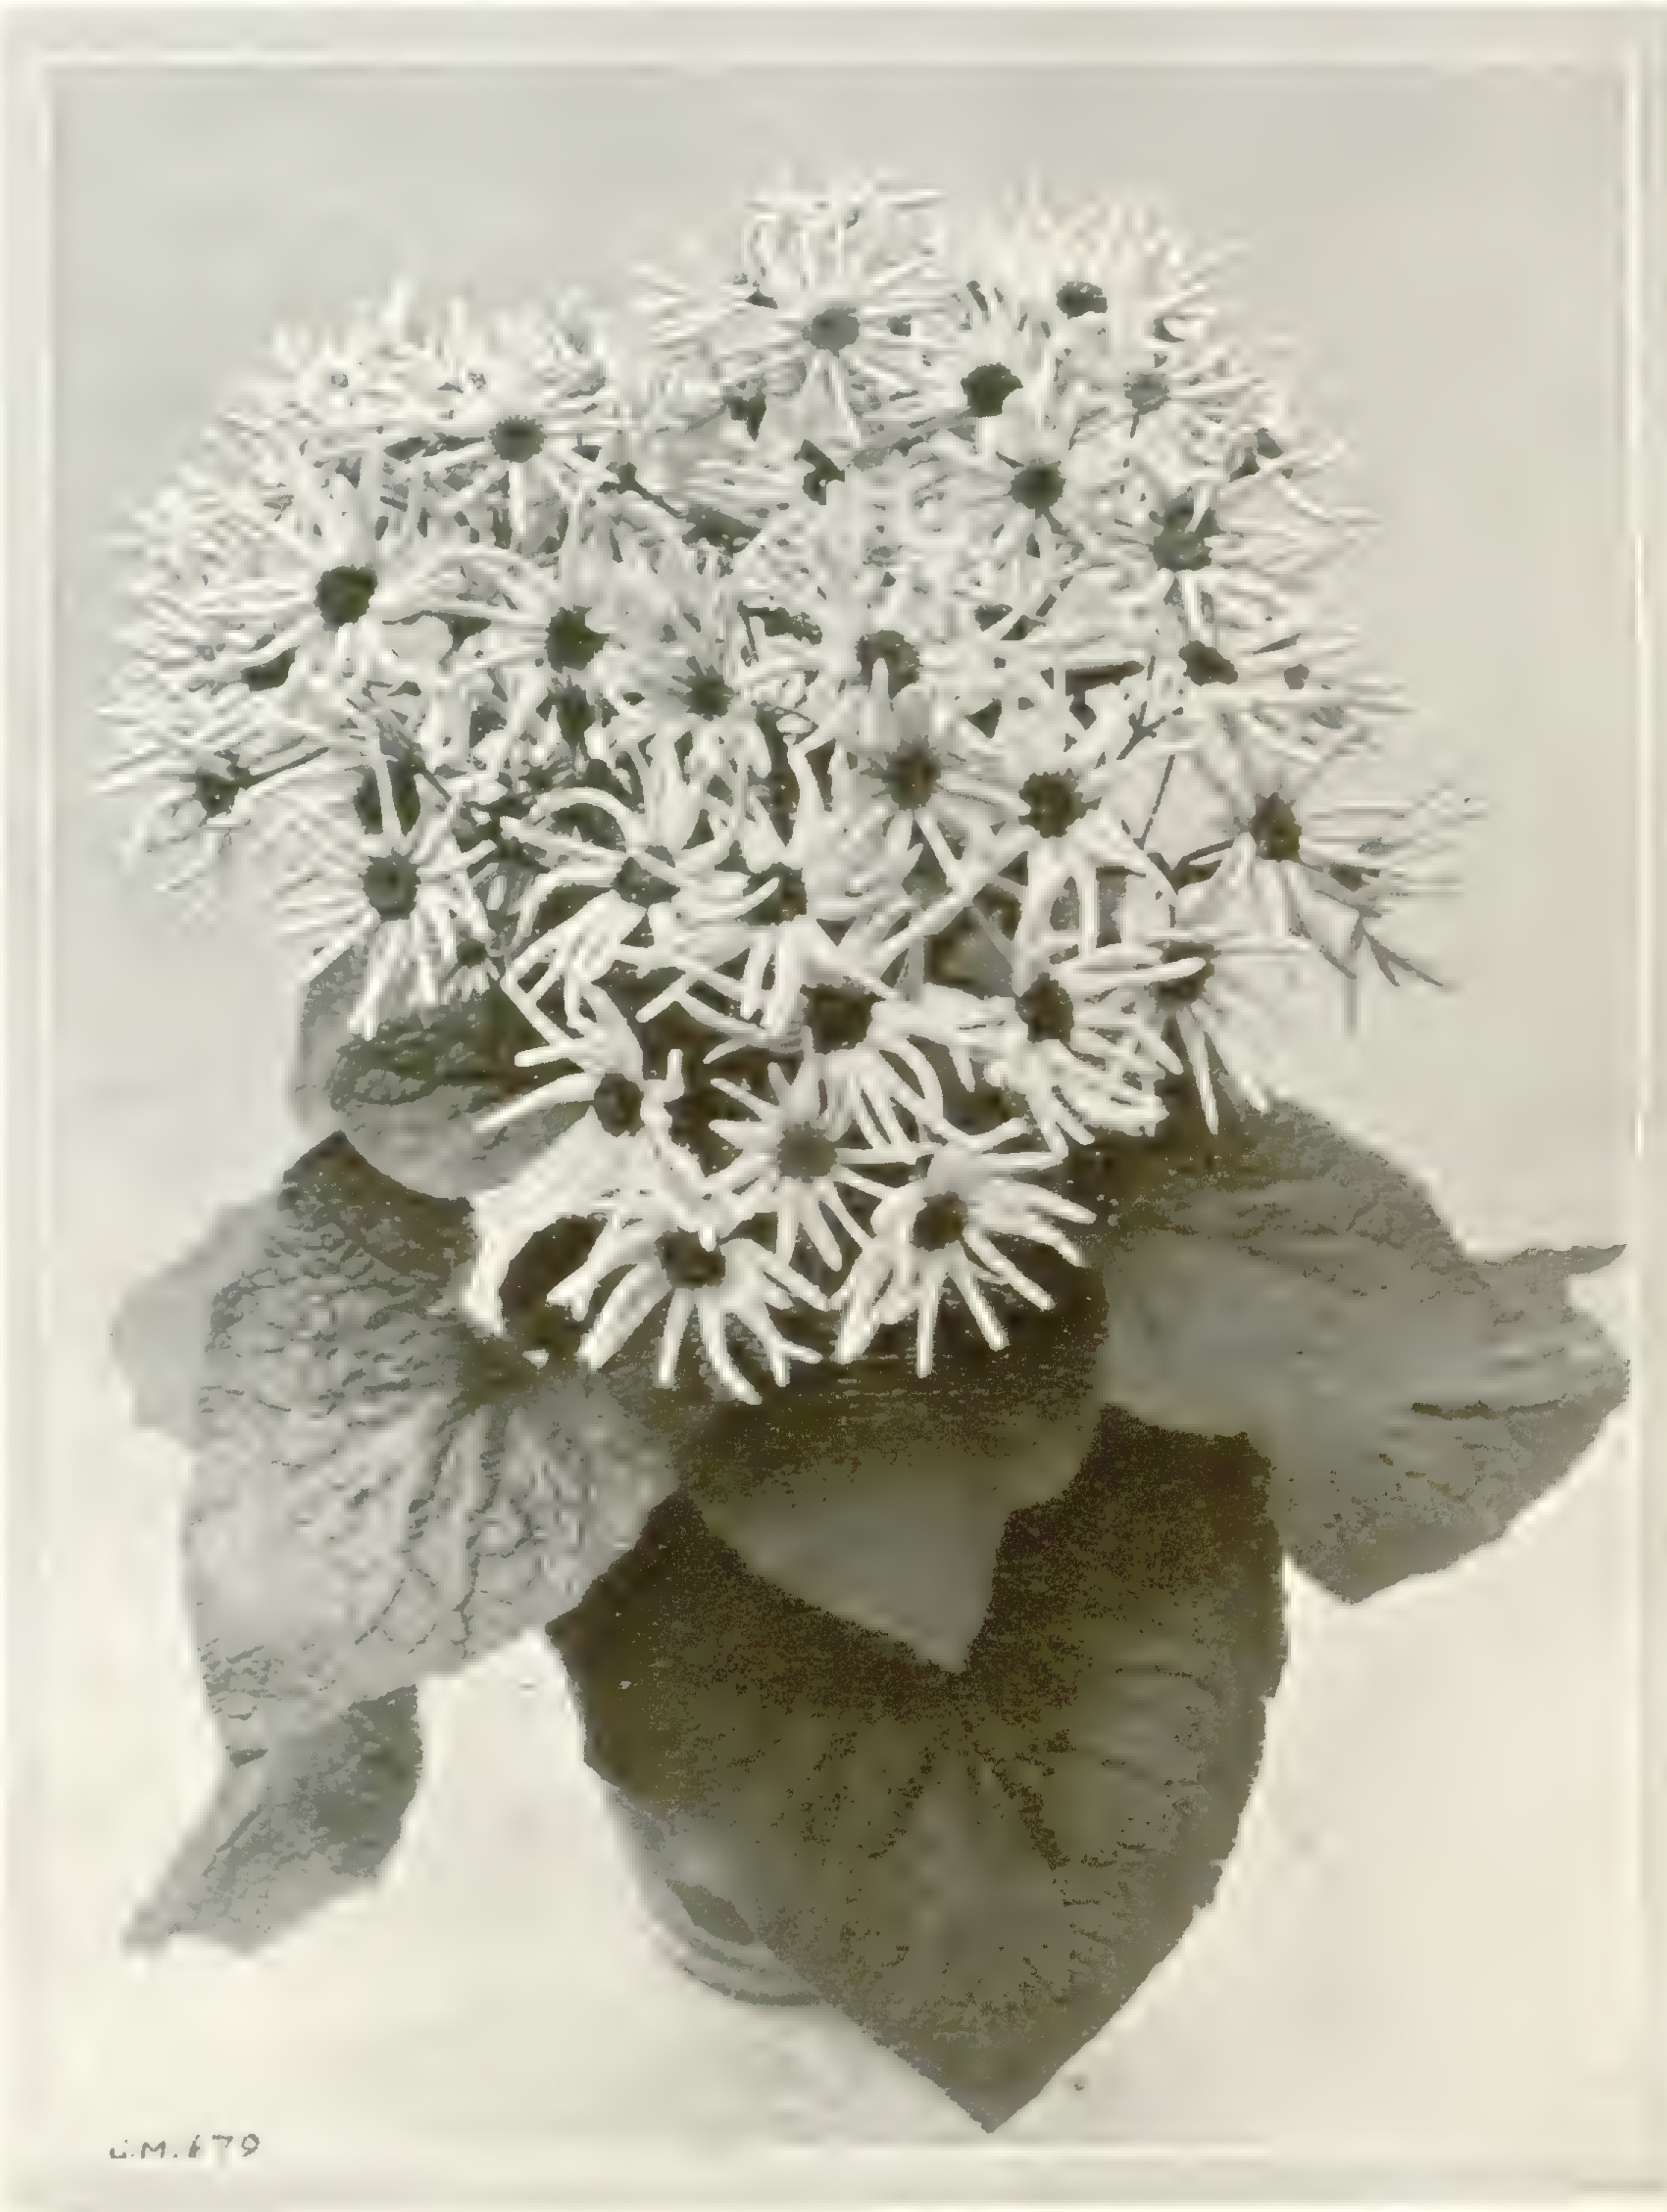
In this devastation one sort stands out as being less seriously damaged than the remainder, that one being Phyllostachys fastuosa. On this the leaves are still green, though they have suffered to some extent; compared, however, with Arundinaria Hindsi, of which every leaf is brown; A. anceps, which has lost all its leaves; or A. japonica, with about half its branches spoilt: it is a column of greenery. Unless a very favourable April and May occur, with warm, moist weather, bamboos will look pitiable objects until midsummer. Such an occurrence as this emphasises the fact that bamboos, which, at their best, are the ideal of all that is graceful and beautiful, are not suitable subjects for indiscriminate planting, and that they should be allotted a corner to themselves, rather than be mixed up with ordinary shrubs, or occupy prominent positions on lawns and in other places. D. K.

ECCREMOCARPUS SCABER.

The Chilian Glory flower is one of the most rapidly-growing of all our out-door climbers, and at the same time it is one of the most delicately graceful. In the South of England it is fairly hardy in a normal winter, while in the South-west of England and Ireland it will continue to keep on growing throughout the winter and even produce a few flowers. Where it succeeds as a perennial it develops thick, woody branches, and may be kept nailed up to a wall like other wall shrubs, some protection being given in the winter, or at least during severe weather. Generally, however, unless the situation is a favourable one, it dies nearly or quite down to the ground in the winter, and in such circumstances it is advisable to put a heap of coal ashes over the roots in November, so that, if cut down to the ground, it may grow up again from the roots in the spring. Slugs are very fond of the young growth and will devour the young shoots from the base before one is aware any have appeared.

In cold and damp gardens, therefore, where this climber not only dies down but slugs molest it, it is better to grow it as an annual. It is an abundant seeder, and seed can be bought very cheaply. If sown in gentle heat in late February or early March, or even in a cold frame in the latter month, the raising of good plants for flowering from July onwards is very simple. They should be pricked out into pans as soon as they are in the third or fourth leaf, and, when an inch or two high, potted off into sixties. If doing well they will soon be a foot high, and should then be planted out in deep, rich soil in a sunny situation—against a wall or arch, or where they can run over shrubs, tree stumps, out-houses, etc. When fairly established it is surprising how quickly they grow—several inches a night in hot weather—while the finely divided foliage and tendrils make it remarkably handsome even without its delicate orange-red racemes of blossom. Though a rich deep soil with plenty of moisture aids its rapid growth, and so enables it to cover a large space quickly, yet, if its establishment as a perennial is the main object, doubtless a firmer, poorer, and drier soil would conduce to that greater hardness and wiriness of growth which is such an important factor in enabling plants to withstand the cold and damp of the winter.

Alger Petts.



CACTUS-FLOWERED CINERARIA.

Colours various. A.M., R.H.S., March 23. Messrs. Sutton and Sons, Reading.

A Good Hardy Kale.—A new kale sent me last year for trial from Messrs. Sutton and Sons, has proved to be of exceptional merit: it has stood the terrible winter wonderfully well. It was sent as Sutton's Hardy Branching Kale. Other good varieties that have done well through the cold weather are Hardy Sprouting Kale, Sutton's A1, Extra Curled Scotch, and Asparagus Kale.—W. A. C.

HOW TO GROW BIG CROPS OF TOMATOES.

The largest tomato plants do not always bear the heaviest crop of fruit. Experienced cultivators know this to be a fact, but persons who have not had much experience in growing the popular tomato plant may be led astray in the matter. I have seen many very fine ranges of glass houses filled with large plants, but the crop of fruit was not in proportion. It is quite possible to obtain as much fruit from a plant three feet high as from one twice that height, when the latter has been grown in loose soil and the former in firm. Of course some varieties are naturally dwarfer than others, they make short-jointed growth. But if we plant examples of the same variety in both kinds of compost, namely, loose and firm, the advantage will be with the latter.

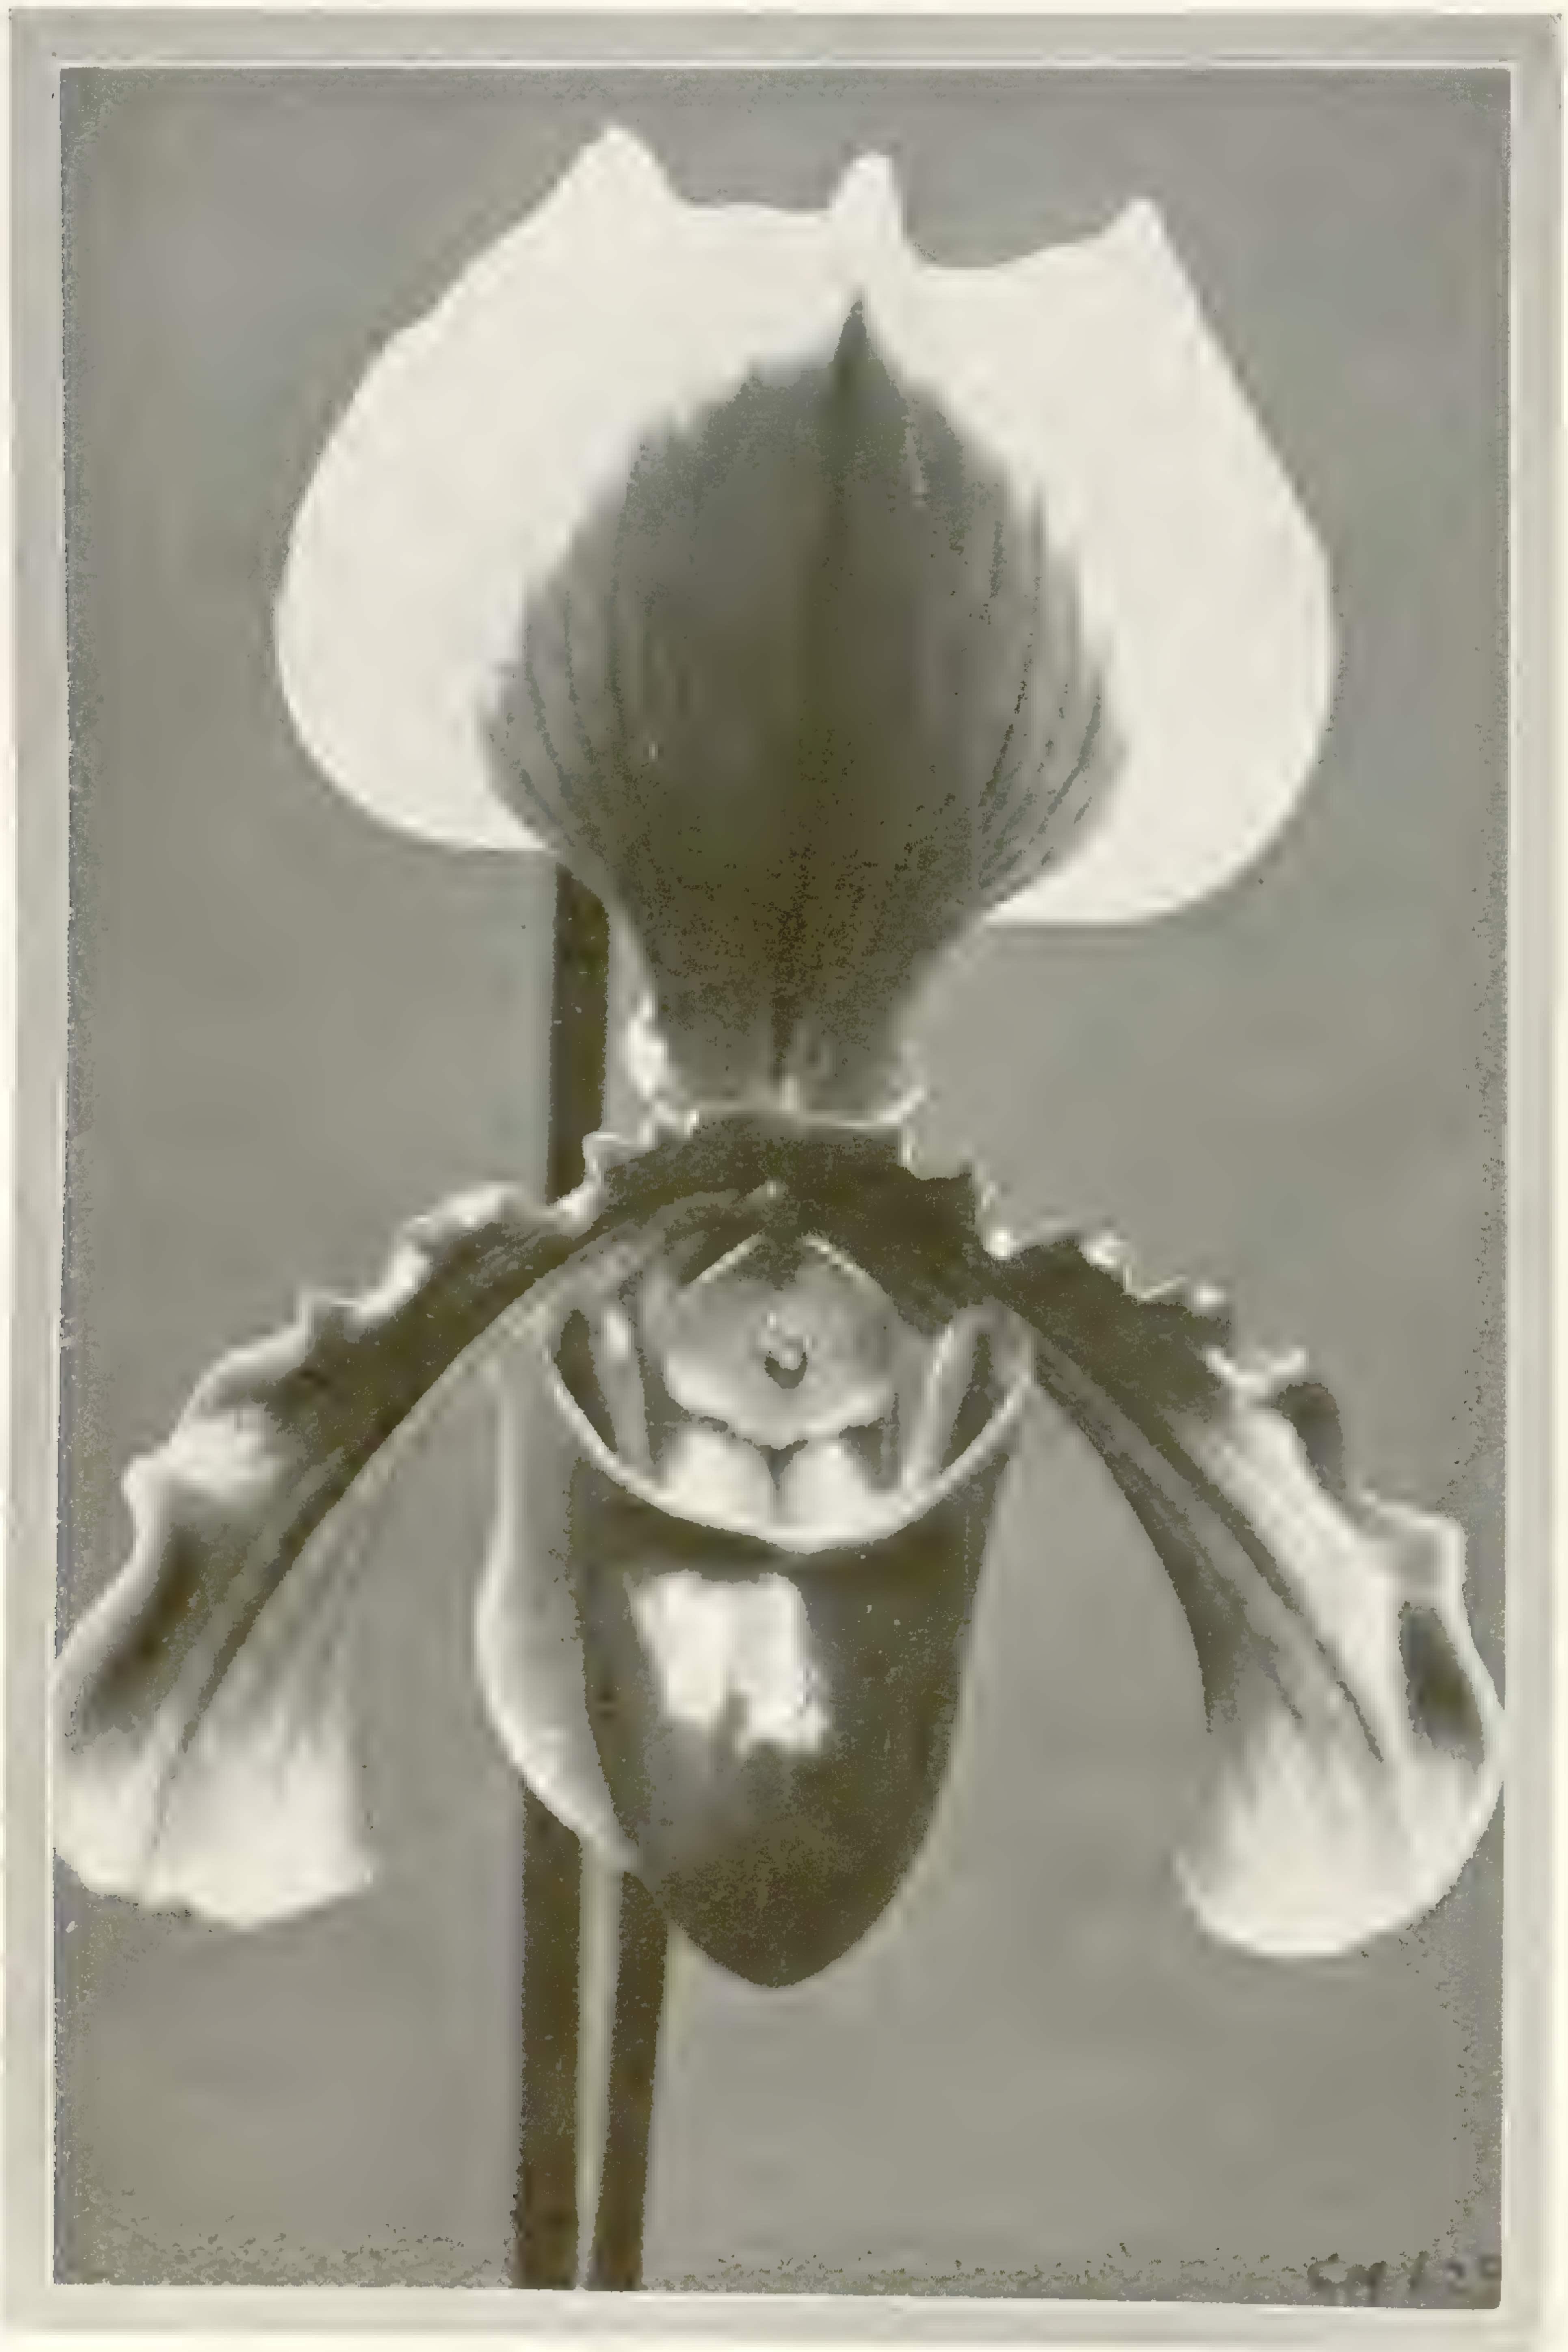
I have experimented for a number of years with tomato plants, and have come to the conclusion that the best policy is to refrain from using any manure in the soil, but to feed the plants—chiefly with superphosphate—after three trusses of fruits have set.

Pot-grown plants, well looked after, always make shorter-jointed growth than those planted out in open borders; and, moreover, the former generally set trusses of fruits first, too. This proves that there is some advantage from root restriction. I do not mean that the number of roots must be lessened, but that their rambling proclivities must be restricted. This objective point can be gained by making the rooting medium very firm.

Procure some good fibrous turves which have been cut about two months. Reduce these to fragments, and, if they are to be used in pots or boxes, make the mass very firm, but do not use any leaf-soil or manure, simply a quantity of coarse sand to ensure porosity. Very efficient drainage is essential. If the plants are to be grown in the border, whether inside, or outside of a glass structure, be equally determined to make the soil firm, and do so while it is in a fit condition to handle, neither too dry nor moist.

The plants will grow quite fast enough, be short jointed, form flower trusses early and not produce very big leaves. Ventilate freely in fine weather, maintain a buoyant atmosphere, and gently tap the flowers at noon every day to ensure a free "set" One ounce of superphosphate, dissolved in two gallons of water applied once a week after the first three trusses of fruits have set, will ensure the swelling of the tomatoes, and produce a big crop on dwarf plants.

GEO. GARNER.



CYPRIPEDIUM TRACYANUM.
Flowers white, yellow-green, and purple.

THE LESSER KNOWN PENTSTEMONS.

Apart from the large-flowered garden pentstemons, there is a valuable group having medium-sized trumpets, which are generally less exacting in their requirements than those highly-developed florists' flowers. On this account they are valuable for extended planting, and as they flower over a long period they can be used to good purpose in the front of mixed borders; some of them will even succeed in ordinary shrubberies, while I have found several species most useful for the rock garden in autumn, and, provided the position is well drained and partly sheltered, they will often survive for two or three years. On the whole it is perhaps safest to regard them as tender perennials and propagate by seed or cuttings, the latter in autumn after flowering, the former by sowing in spring.

Pentstemon Newbury Gem is a fine form of P. campanulatus, and is largely employed for bedding purposes in summer, the freedom with which it flowers, combined with the attractive carmine-red colour of the blooms, which remain effective for months, accounts for its position in many gardens; there is also a white form of Newbury Gem having all the good points of the type, and in some respects it is a much more useful flower for grouping.

P. heterophylla is a good subject for the rock garden. It is fairly hardy, producing pale blue flowers, with just a suspicion of magenta at times; these are at their best from midsummer till autumn, and when planted in company with Œnothera riparia they brighten the rock garden at a season when its beauty is decidedly on the wane. P. cæruleus is less compact in growth but a much finer blue, and one of the best for the rock garden. It flowers in summer.

P. Hartwegii is a good species, but for garden purposes Newbury Gem surpasses it. P. barbatus Torreyi is the tallest grower, the flowering stems reaching a height of over 4ft.; the flowers are tubular, but more contracted at the mouth than in the others, and are coloured bright scarlet. They are borne freely upon branched stems of a soft grey colour, which add somewhat to the effect. It is a plant of great beauty in the autumn border, and the best results follow early planting.

THOMAS SMITH.

Walmsgate Gardens.

CYPRIPEDIUM TRACYANUM.

This striking Lady's Slipper orchid belongs to the cool section, and is one that is of sufficiently high merit to warrant inclusion in the choicest of collections. It has a very bold flower, the white band of the dorsal sepal serving to bring out the rich yellow-green colouring of the base, and of the petals and lip. These latter have also some purple and brown shading. The parents of C. Tracyanum are C. aureum and C. Leeanum giganteum; the first-named is derived from C. Sallieri Hyeanum and C. Spicerianum, while C. Leeanum giganteum came from C. Spicerianum and C. insigne. Further, C. Sallieri is the result of crossing C. insigne with C. villosum. In C. Tracyanum the influence of the two fine old species, C. Spicerianum and C. villosum is very obvious. Our illustration of C. Tracyanum represents a fine flower shown some little while ago by Messrs. Moore and Co., Rawdon, Leeds.

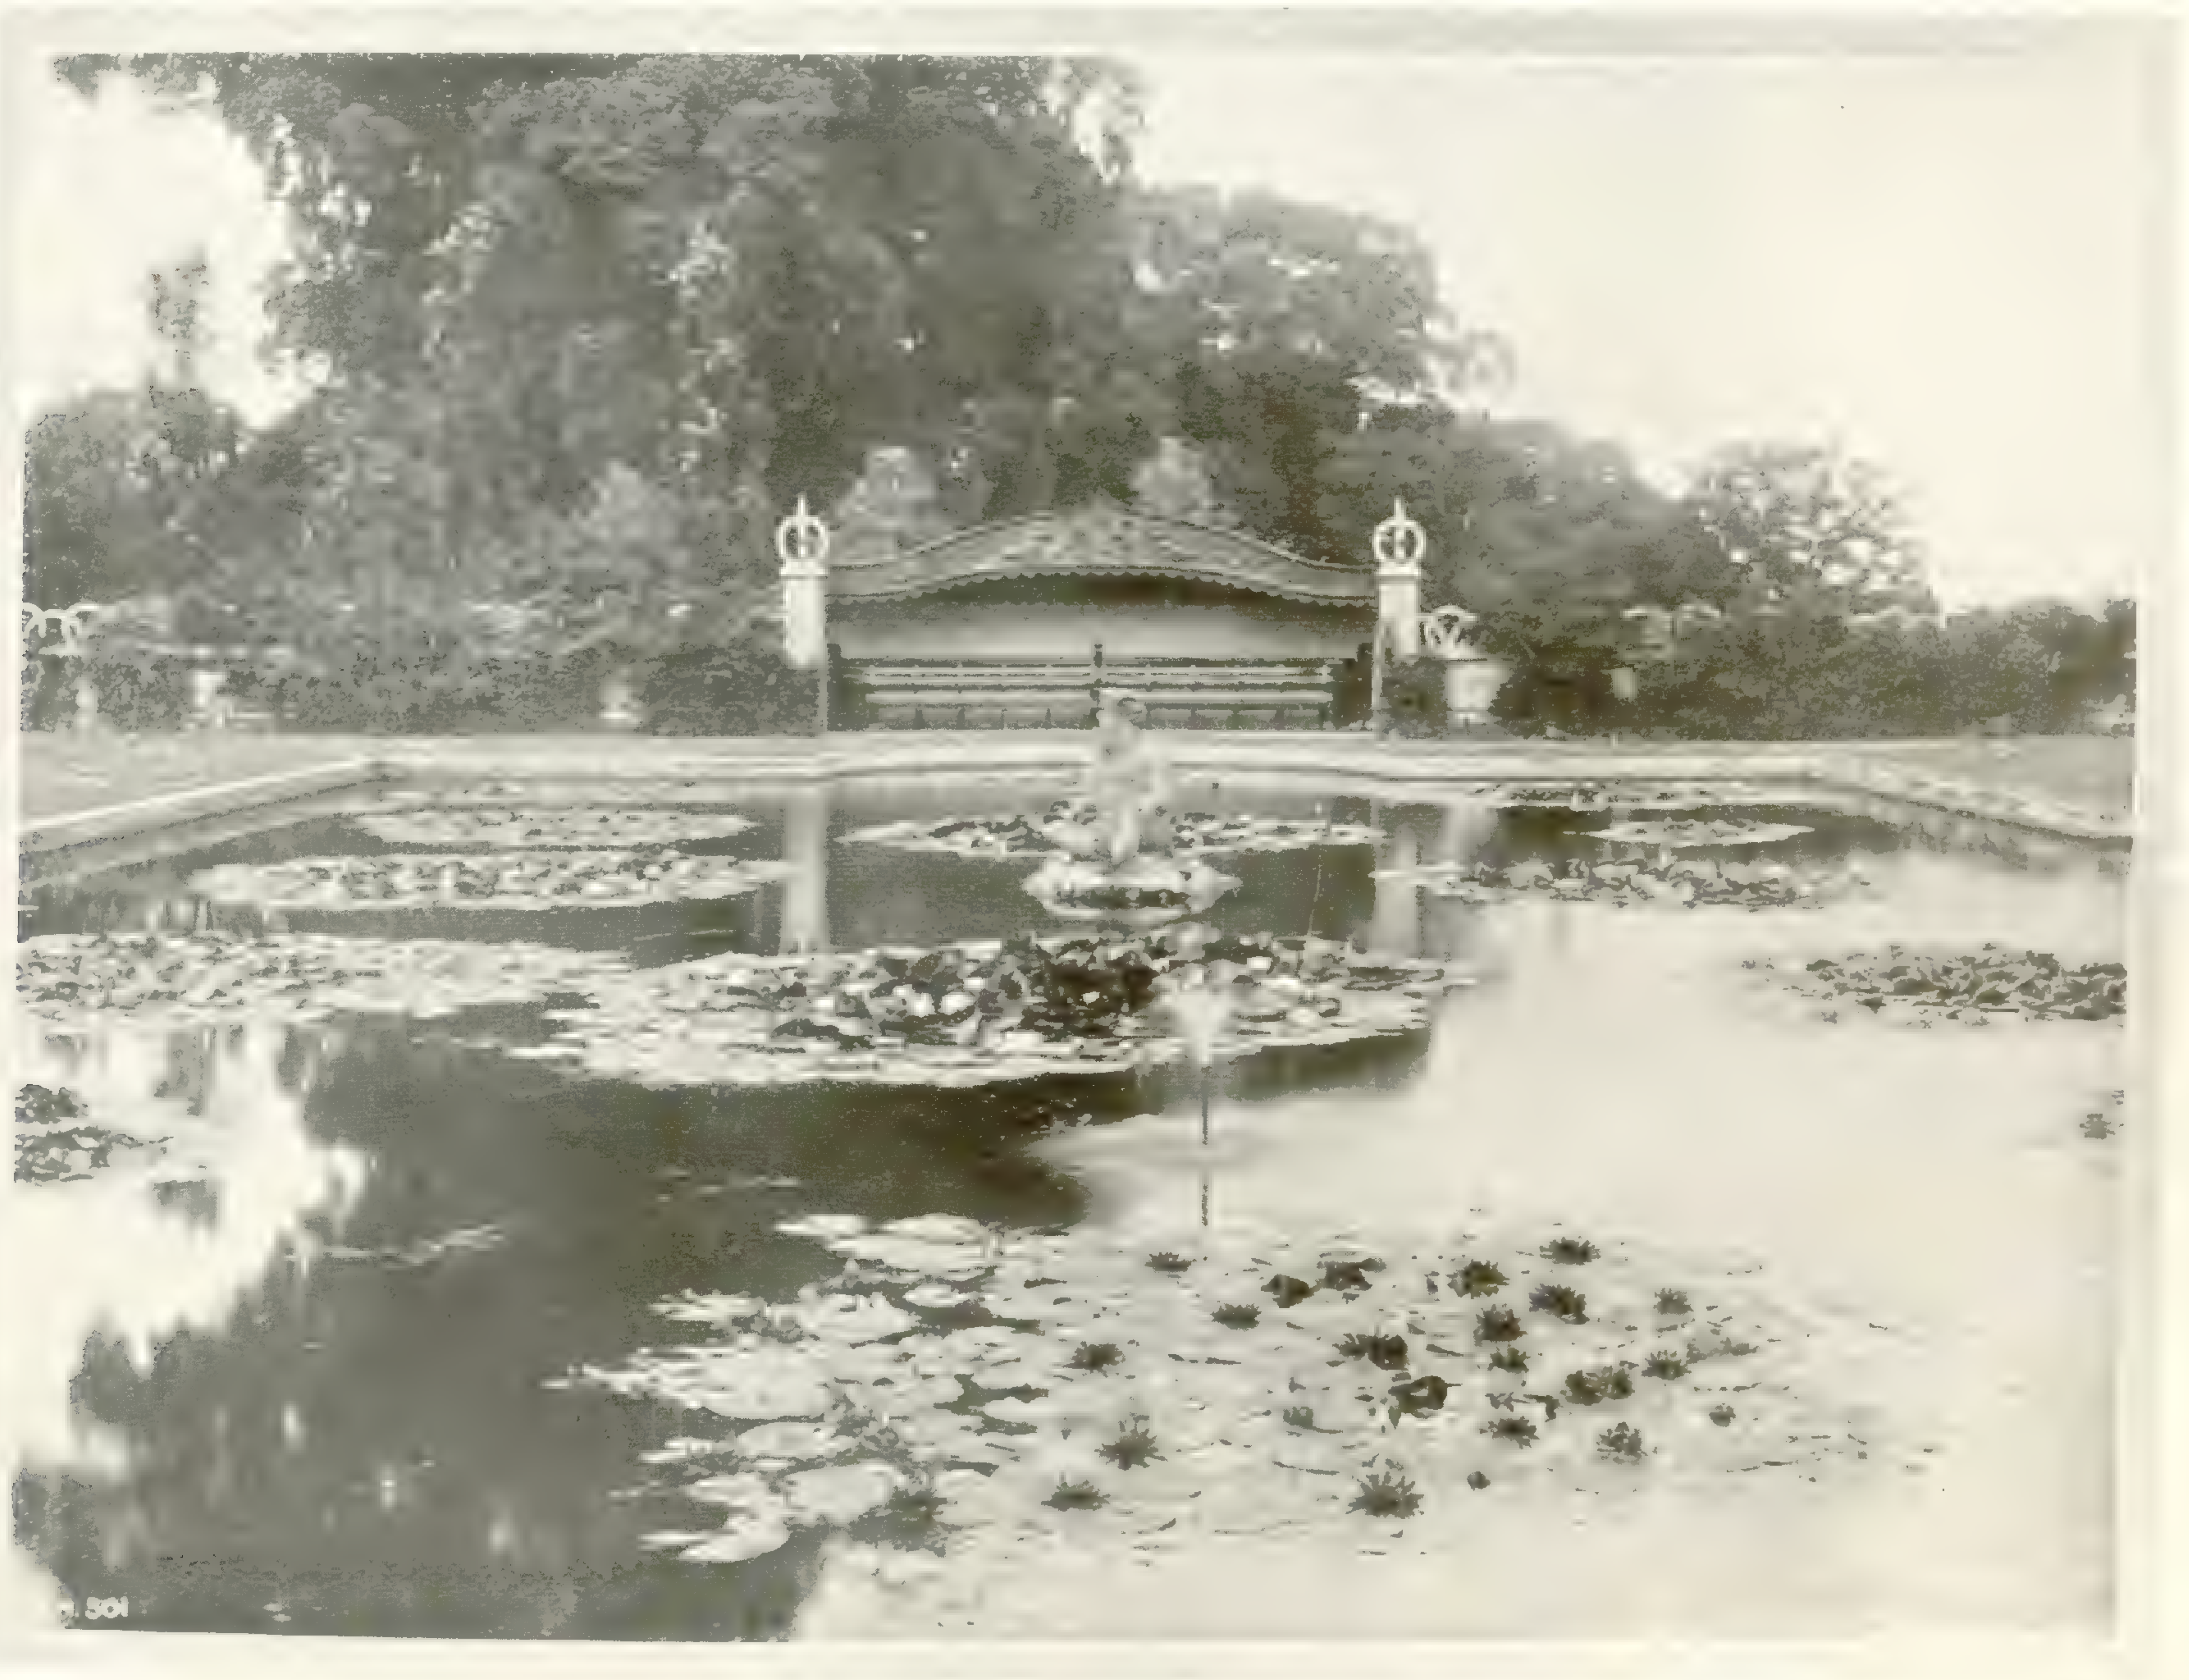
CROCUS VERSICOLOR.

An old and once well-known Crocus, C. versicolor, has gone largely out of favour within past years, and is now but little seen in British gardens. This is doubtless due to the superior value of the varieties of Crocus vernus, whose more opulent beauties have justly given them greater favour in the eyes of the gardener, as being more useful for general decoration in spring. Yet one comes across it in some old gardens, as well as in those of the crocus specialist, who is attracted by its pretty flowers for they are pretty, although neither so large nor so rich in colouring as the varieties of Crocus vernus.

This species is sometimes sold on the Continent as the Cloth of Silver crocus, although this name is also applied to one or more of the forms of the Scotch Crocus, C. biflorua. As procurable from Continental sources, C. versicolor is a comparatively small flower, with pointed segments, which are variously coloured, varying, as they do, from purple to white, and at times striped or feathered with purple outside, and in other examples quite plain. A good group will often present much variety, and will thus be an object of interest, especially when the flowers open out nearly flat in the sun, as they do when it shines brightly upon them. The plants, however, make little effect as a mass, compared with the varieties of Crocus vernus, not only because of the variation in their colouring and their smaller size, but also because the various-coloured crocus is not such a free bloomer.

Yet C. versicolor is an interesting and pretty little crocus, not to be despised, but worthy of a place on some sunny bank or border, where it can remain undisturbed for years. In a grassy bank, where the grass is left untouched until the leaves of the crocus wither, it may remain for several years, and will there give an annual crop of flowers. It comes from the neighbourhood of Mentone and Nice, and adjoining regions.

S. Arnott.



THE LILY POND AT HILLINGDON COURT, UXBRIDGE. [Photo: H. N. King.

THE LILY POND AT HILLINGDON COURT.

The great beauty and usefulness of the finer water lilies has been the subject of many articles in these pages, and numerous have been the illustrations of lily ponds and water gardens that have been presented. These latter have served to show how widely different are the tastes of garden owners, and, also, whether the taste be for the formal or the informal or natural pond, how wide is the range of design in each case. There are many features of great beauty and interest in Lord Hillingdon's garden at Hillingdon Court, Uxbridge, and one of these, the lily pond, is figured in the present issue. It is a formal pond, with architectural features, including a handsome arbour at one end, and a fine central figure. All the best of the nymphæas, including Marliac's varieties, are in the collection, and they make a magnificent display under Mr. A. Allan's care.

As it is at this season of the year that water lilies should be planted, the illustration is purposely suggestive. In many gardens the lovely nymphæas are to be installed for the first time, and in others the question of introducing novelties may be under consideration. It is a good plan to place the substantial soil in a wicker basket for nymphæas, and sink these so that they are about a foot or so below the water level. Another method of planting is that of making brick or cement receptacles, and this is sometimes followed in formal water gardens, but something should be done to prevent the soil from being carried away from the roots of the lilies by the movement of the water. Wicker baskets offer the easiest method, but brick burrs or stones placed round and partly over the mound of soil will also answer the purpose.

A good dozen water lilies are Nymphæa Marliacea albida, white; N. M. carnea, flesh; N. M. Chromatella, yellow; N. M. ignea, crimson and rose; N. M. rosea, rose and pink: N. M. flammea, white and red-purple; N. Laydekeri fulgens, crimson: N. L. lilacea, rose-pink; N. L. fulva, yellow and red; N. Robinsoni, deep rose-red, with orange stamens; N. sanguinea, rich carmine; and N. gloriosa, bright red.

Broccoli.—We have been potting up broccoli for some few weeks past, taking them up with a good ball of earth attached, putting them in 9in. and 10in. pots, and placing them in gentle heat. These have come along beautifully, and stopped what otherwise would have been a gap in the supply. Cabbages of the early type, if stress of circumstances warrant its being done, may be brought along in the same manner. Asparagus, seakale, and French beans are all in extra demand this year, and parsnips, carrots, and artichokes have been in great request.—W. A. Cook.

FLOWER BED SHAPES.

The shapes of flower beds are so important that it is surprising how little this fact is insisted upon by writers on gardening subjects; unless a bed is given up to tall shrubs or plants, so that its outlines are not all visible from the same point of view, it lies upon turf or gravel as a design itself, the effect of which is, of course, extra noticeable if the flowers in it are self-coloured. A round bed of scarlet begonias, for example, looks like a round disc of red from a little distance. A half moon bed of white blossoms or white foliage appears from not very far as a silver crescent. Yet year after year bedding out is done elaborately, without any regard to the landscape result, and frequently in beds the contours of which are hopelessly inaccurate, even if the shapes are not actually ill-suited to their environment. Edges of stars, octagons, diamonds, etc., become encroached upon by turf, or partly cut away by the shears or clippers until the mathematical proportions are all wrong, and offensive, therefore, to the artistic eye.

Before the tender plants are put out this May, or before hardy annuals are sown in March and April, let the gardener go the round of the beds and test them by measurement, putting in corners and sides that have been lost, and cutting away all excrescences. Perhaps it is the simple round bed that is most likely to have parted with its correct shape, a truth that may be seen witnessed to in dozens of front gardens viewed from suburban roads.

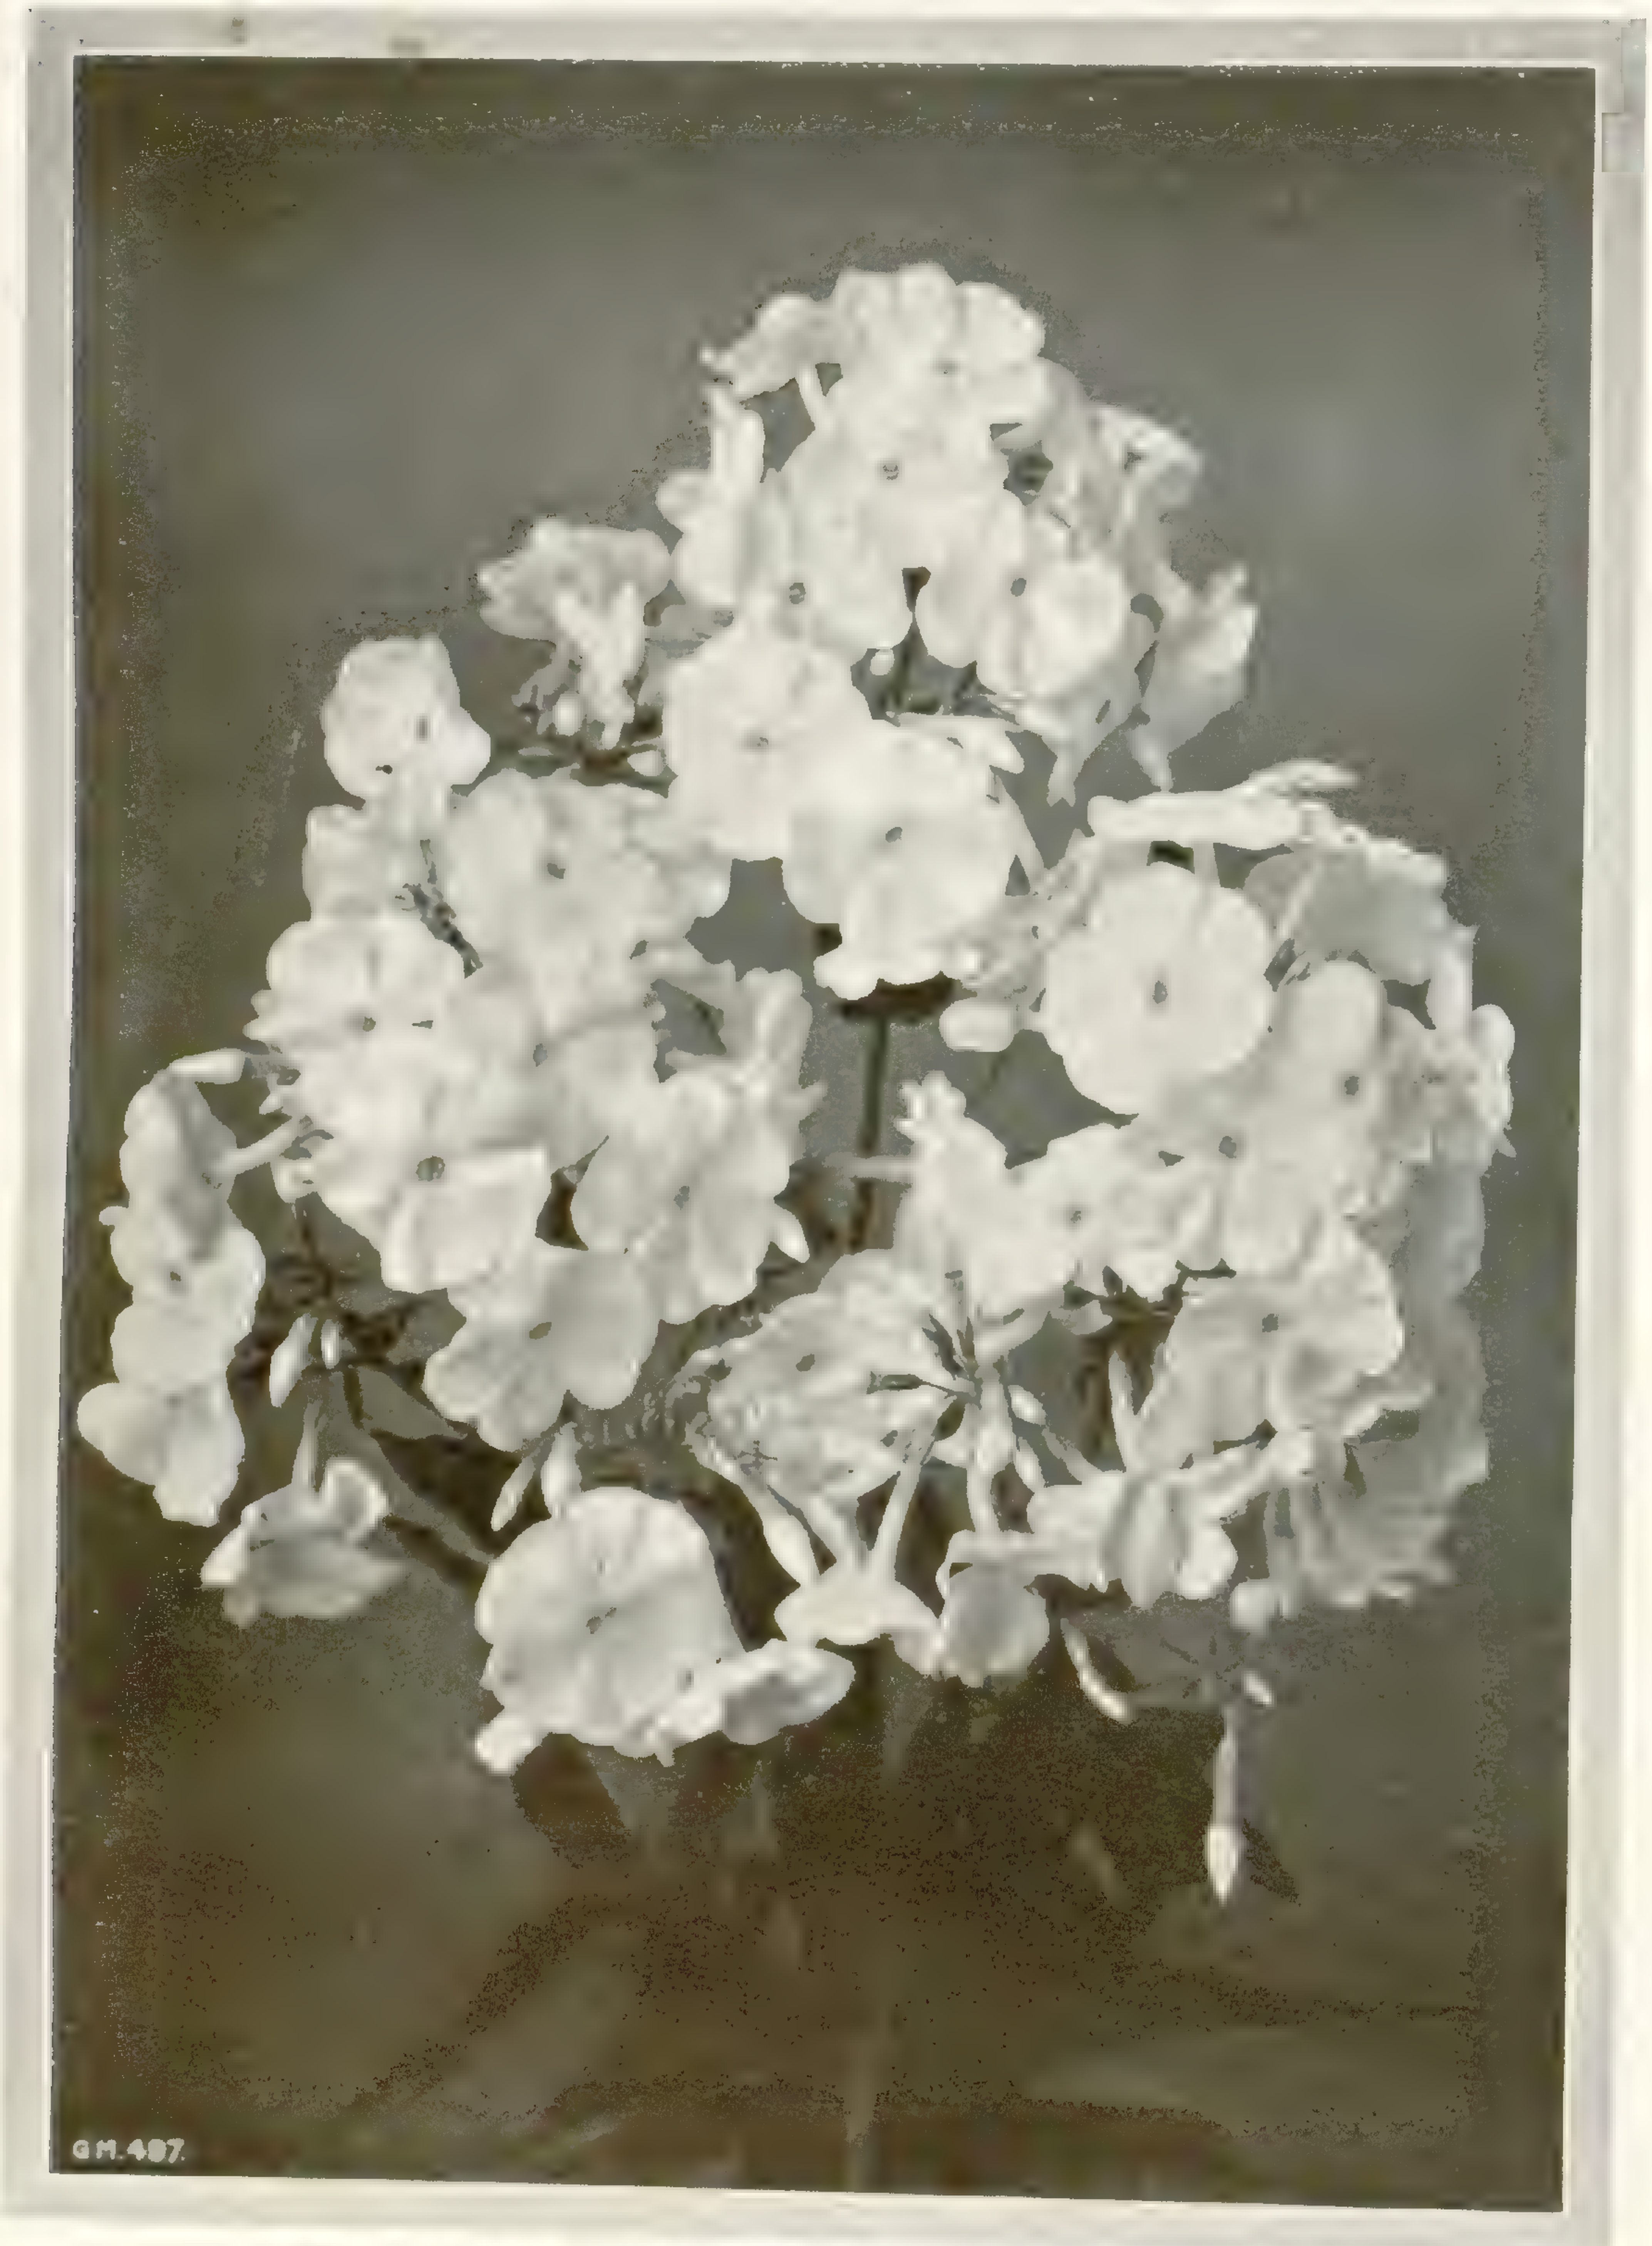
Lawn beds are often too large, that is to say, of too uniform a greatness. The practice of ending a lawn by a wide, waved border bed, split in two to make an exit to a path beyond, is admirable, since in this ample breadth of ground there is room for the culture of roses, or handsome as well as lesser perennials, a bold colour and group effect being thereby gained. It is customary, too, to arch over the turf exit path, which adds considerably to the charm of the scene. Sometimes this method is not chosen, and a trio of large beds is made instead; if these are of similar width and length, also of similar shape, the result is never good; three big rounds, squares, oblongs, or diamonds pall upon the vision, and the evil can only be remedied by making either the centre bed, or the two end ones flat as to flower, and employing tall growers in the others, or other. If the centre bed is a large round, the neighbouring ones may be equally large star shapes without as much harm being done, however, because the in-and-out lines of the stars will detract from their heavy appearance.

A fine round bed, given up to roses, with a viola carpet, always looks well upon a lawn; it is perhaps best situated well to one side, at the end facing the house windows; if placed too much in the corner it looks somewhat overwhelming. The fashion of almost outlining a lawn with the narrowest of border beds is an exceedingly useful and pretty one; novelty of effect is gained by cultivating espalier roses along these edges, with pinks, violas, aubrietias, primroses, and a host of the hardy dwarf plants for a carpet; a collection of tall perennials, well separated by stretches of lesser plants, will better please some flower lovers. When the lawn is curved or waved, and the border beds reproduce this the elegance is most noteworthy.

Scroll-shaped beds are seldom seen, yet are graceful in most positions, and may be either wide or narrow, according to the demands of the ground; a ring of scrolls, placed slantingly around a large round bed forms a group of real beauty. Those who need a suggestion or two for mingling shapes need not be ashamed to study the pattern books of modern wallpapers; he will find ovals set in crescents, octagons ringed round by quaint fans, stars accentuated by additional points, a whole gallery of clever mathematical combinations, in fact, that can be carried out in flower bed fillings as well as outside shapes.

Lawn corners often need softening in appearance, for the day when acute angles and hard, straight lines were generally demanded has given place to a time that better appreciates the value of the curve. It is seldom advisable to treat two corners of a lawn alike, which gives the opportunity for varying the heights of the scene; one corner may possess three quite small rounds with a pillar rose, delphinium, hollyhock, or ornamental shrub in each; the second can be given up to a rockery mound, stump of a tree hollowed out to form an urn, or a raised bed, or sun-dial; the third, perhaps, is selected for a moderate-sized diamond bed for dwarf roses, or a flat display of bedding plants; the fourth will be sufficiently adorned by a clump of pampas or one of the other noble grasses. If two or more corners of a lawn are, however, to have beds cut in them of similar shape, there is no better one to imitate than that of a fan, with the point facing the point of the grass. A diamond fits into the angle as well, but it will be found that four round hearts, or octagons, which necessarily leave awkward shaped strips of turf partly surrounding them, have a clumsy appearance.

M. H.



NEW PHLOX FREIFRAULEIN VON LASSBERG.
Flowers pure white. A.M., R.H.S., September 1, 1908. Messrs. Gunn and Sons, Olton.

PHLOX FREIFRAULEIN VON LASSBERG.

One of the very finest of the newer phloxes is the pure white variety bearing the rather weighty title of Freifraulein von Lassberg. This belongs to the late-flowering, or decussata section, and grows about two feet high. The blooms are of fine size and form, and are borne in [illegible] branching spikes. So free and beautiful is this phlox that many lovers of these beautiful flowers regard it as the best and purest white variety in cultivation. Messrs. Gunn and sons, of Olton, Birmingham, showed Freifraulein von Lassberg finely on several occasions last autumn, and on September 1, the variety received an Award of Merit from the Royal Horticultural Society, when exhibited by them.

THE HOLBORN PRIMULAS.

The Holborn primulas are not to be found at High Holborn, at least not the plants, though flowers may sometimes be seen at Messrs. James Carter and Co.'s extensive premises in that famous old thoroughfare. You go or send to Holborn for the seeds; you go to Houston Road, Forest Hill, to see the plants, and a very fine sight they are.

Everyone is as busy as a bee at these nurseries, both literally and metaphorically, for though they may not be exactly "gathering honey all the day," they are pollinating the primula blooms by means of small camel-hair brushes. Six or more times during the flowering season do the big batches have to be worked over, and every open flower dealt with. What this all means will appear when we say that there are nearly 17,000 primula plants in bloom at Messrs. Carter's Forest Hill Nursery. Some varieties do not seed so freely as others, and so larger batches have to be grown to meet the demand. This is especially the case with the giant forms, and with the wonderful Bouquet variety, in which the calyx has become leafy and fringed, making a novel and pretty setting for the bold pure white blossoms. The older type, the stellata varieties, and even the majority of the doubles seed freely at Forest Hill, and the various colours and types are kept very true. The utmost care is taken to maintain this fixity of colour and form, and the care is well repaid by the popularity of the Holborn varieties. The brushes used to convey the pollen from anthers to stigma are carefully labelled with the name or number of the variety they are used for, so that there is no fear of "mixing" the varieties, as would be the case if a brush used to pollinate say the beautiful new Holborn Coral were also used one day for pollinating the very fine white King Edward.

VIEW OF PART OF A HOUSE OF PRIMULAS BEING GROWN FOR SEED AT MESSRS. J. CARTER AND CO.'S NURSERIES, FOREST HILL.

One of the greatest wonders of the floricultural world is this Chinese primula, for, in the hands of many and without the intervention of any other species, it has given a very wide range of colours, various kinds of leafage, and several quite distinct strains or races of plants. There are the fern-leaved and plain-leaved families of the popular florists' form; there is the giant race with bold trusses of unusually large and substantial flowers; there is the elegant and useful stellata race, with its tall, tiered spikes of graceful flowers; the Bouquet variety provides another race or strain; the double varieties yet another group; and now there is a new race of ivy-leaved varieties in course of formation. One might even further subdivide the Chinese primulas, but these instances will suffice to emphasise the fact that Primula sinensis has proved extraordinarily variable, and yet, on the other hand, hardly any popular plant is so easily kept true to colour, once the variety has been fixed.

Messrs. J. Carter and Co. annually test their own productions, and one house is now full of plants representing the whole range of their primula varieties. There are from six to twelve plants of each, and these have been raised from seeds sent down from Holborn in the ordinary packets as sold to customers. In another house the process of evolution is being carried on. Here are to be found little batches of new cross-bred varieties, some giving promise of progress in new shades or in depth or purity of colour. Not a few are soon consigned to the rubbish heap after a note has been made of their character in the stock book. If a plant in any of the popular varieties shows a tendency to break from the recognised character, it is brought to this house, self pollinated, and, it may be, the progeny will, in a few years, provide a new variety.

Several years ago the Messrs. Carter used to have their primulas in bloom at the New Year, and even nowadays a few early-sown plants are brought into flower early, but the increasing demand for seeds of these fine Holborn strains has led to later sowing, and consequent later flowering. The brighter light, and the sunshine of March are found far more favourable to fertilisation than the duller days of January, and it has been found that this later blooming and seeding does not in any degree affect the time of flowering in the progeny. The flowering time is all a matter of sowing and cultivation. Man's genius to bring out the latent forces of Nature is very amply demonstrated at Forest Hill, where, for over half a century Messrs. Carter and Co.'s experts have made Primula sinensis tall or dwarf, double or single, white or scarlet, pink or blue, coral or crimson, salmon or ruby, plain or crested, large or small.

Turning to the brilliant and beautiful picture presented by the thousands of well-grown and finely flowered plants, in their many varieties, one is compelled to admire the cultural as well as the creative skill they represent. Holborn Crested, and Holborn Coral, the former a prettily frilled or crested pink variety, and the latter a giant coral-pink flower of great substance and beauty, strike one as great advances. King Edward maintains its place as a foremost white, its bold heads of white, orange-eyed flowers compelling admiration. Elaine also keeps its place as a fine white of the ordinary type; it is especially free blooming. Holborn Scarlet, Holborn Vermilion, and Carter's Ruby provide a blaze of colouring, while Princess May gives a dainty pink, and Orange King is orange-pink, the orange shade being most evident in the half-opened flowers. Among the doubles our favourites are Snowflake, white; Lilac Queen, a buish lilac shade; Daybreak, rose, shading to terra cotta; Carmine Empress, deep carmine; and Prince of Wales, deep rose. The Star primulas have not received fanciful names, but are grown and catalogued according to their colours, as white, pink, lilac, blue, salmon, and crimson. We may add that the ivy-leaved primula is quite fixed at Forest Hill, but there is some doubt as to its commercial value as yet. Here, as in other places, the pure yellow primula is being worked for, and efforts are being made continually to secure a blue primula, bright sky-blue or deep navy-blue, and, remembering the slatey colouring of only a few years ago, and the advance made since then, there seems a fair prospect of success in the near future. One very distinct variety that will soon be obtainable is at present named Late White. Sown at the same time as the other varieties it was not in bloom by the middle of March, so that where primulas are great favourites this variety will provide a display for Easter time.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

THE CATTLEYA HOUSE.—At the present season of the year there are many species and hybrids of cattleyas and allied genera that are emitting new roots. I think if there is one general rule that may be followed in respect to the best time at which to repot our orchids, it is to pot when the new roots make their appearance. Any repotting or top dressing necessary should therefore be done as far as possible when the plants are in this state, the only exception being in cases where the plants are about to produce their flowers, or will be flowering within a reasonable time. Such plants should wait until after the flowers have been removed, and where plants have to be repotted after flowering, the flowers should be removed within a reasonable time after they have become fully expanded. Care should be observed to protect newly-potted plants from much light until the new roots have become established in the fresh compost. The temperature should also be kept as even as possible, and the atmosphere reasonably humid.

CONDITIONS.—It should always be borne in mind that the successful cultivation of orchids depends chiefly on the conditions under which the plants live. Potting material used is a secondary matter. No better illustration of this can be found than in visiting gardens where there is no pretence to cultivate orchids, and yet where we find some one or another of our most difficult plants growing luxuriantly under anything but orthodox methods. This, I think, bears out the contention that if we find the right position and conditions it is of far more importance than the question of what a plant should be potted in. I very much doubt if there are two gardens in the country in which the same facilities are provided for the cultivation of the same class of plants, and even if it were so, there are the conditions to be considered. There is the smoky atmosphere of larger towns and manufacturing districts, and the pure atmosphere of some country districts; and as light is one of the most essential factors in successful cultivation under artificial conditions, it will be at once obvious how impossible it is to apply the same rule all round. It is those who are in charge of the plants who must determine the best local conditions. This knowledge cannot be obtained unless the worker has the interest of his charge at heart, and some experience with his facilities and surroundings. Cattleyas, to those who know the least about their cultivation, are most attractive, and often, when they find the culture difficult, they give up growing orchids as a hopeless case, and frequently blame those in charge for improper treatment. It is for the purpose of removing to some extent wrong impressions that this note has been written.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

STOVE CLIMBERS. Upon walls and pillars climber growth will now be rapid, and require frequent attention. When young shoots are produced too freely remove the surplus in the same way as from the peach and vine. In such positions evenly-balanced plants are by far the most beautiful, and at the same time do not exclude light from the plants underneath, as is the case when allowed to become overcrowded.

CISSUS DISCOLOR, as a foliage climber, is one of the prettiest, and it is easily propagated, if at the time of pruning cuttings a few inches in length are inserted; these will soon root, and make growth, and, if carefully handled, they may with advantage be utilised for table decoration, for which they are remarkably well suited. Suspended in small pots, when each growth hangs clear, with foliage and tendrils complete, they form suitable subjects for draping vases on the dinner table, or the growths provide a tracing upon the cloth. In each small pot three or four cuttings should be put, which will produce six or eight growths.

DIPLADENIAS.—When starting into growth a good portion of the soil should be removed, and the plants be repotted in rough fibrous peat, with silver sand freely intermixed. While the plants were resting all weak growth should have been removed to make room for the new and more vigorous flowering shoots. When such kinds as D. insignis, D. amabilis, D. boliviensis, and D. Elliotti are grown for training under rafters and over trellises, their habit of growth and beauty of flower are unsurpassed.

FICUS ELASTICA.—In a stove temperature the stock of this plant is easily increased by cuttings, or eyes with a leaf attached, and when well grown, properly hardened, and established, these are unsurpassed among stove plants for standing changes of temperature and atmosphere, and are not at all fastidious, when well rooted, as to soil; three parts turfy loam and one of peat, with sand added, answers well.

JASMINES.—Where space is available these should be included, for the large, sweet-scented flowers of J. gracillimum and J. Duchess d'Orleans resemble small gardenias. The flowers are produced more freely when the roots are somewhat confined in a compost of loam, leaf-soil, and sand. The flowering season is during the autumn and winter months.

GENERAL REMARKS.—On bright days it will be necessary to lower the blinds for a while in the middle of the day, yet I think the practice of shading is in many cases a little overdone. Recently potted plants now rooting freely will require more frequent watering, plenty of moisture and heat being absolutely necessary. Give top ventilation when the temperature reaches 75 degrees, and close before syringing in the afternoon. To keep insects in check use the syringe freely, and fumigate lightly and frequently.—WM. FYFE, Lockinge Gardens.

FRUITS UNDER GLASS.

PLANTING VINES.—The present will be a suitable time for planting new vines. One-year or two-year old plants should have been selected, or young plants raised from eyes this spring might be used, as these will be now making rapid growth. They will require very careful handling, so as not to disturb the roots, which are, of course, very tender at this early stage. If the older plants are used they should be turned out of the pot and have the ball of roots immersed in a tub of tepid water. Then shake out most, if not all the soil, and disentangle the roots. Spread the roots carefully all around, and work some moderately fine soil in and about them; do not plant deeply, as surface roots can be fed and nourished better than those which are low. The border, for the first year, need not be more than 3ft. wide, but it is advisable to make the drainage of the whole border properly at the outset, and the drainage for the vine roots needs to be perfect. Muscat of Alexandria, Black Hamburgh, Muscat Hamburgh, and Madresfield Court are hard grapes to beat for flavour.

TEMPERATURE.—If young plants of this season's growth are planted, the house must of necessity be kept close and warm, say 60 to 65 deg., and 70 deg. with sunshine; but if cut-backs are used, they may be grown along steadily, damping the house down and spraying the vines at closing time, which should be about 2.30 to 3 p.m., according to the weather.

DISTANCE APART.—The distance at which to plant vines from each other depends a good deal upon the plan to be adopted. If single canes they should be quite 4ft. 6in. apart, though 5ft. would be better, as this allows plenty of room for lateral development, and vines planted this distance apart will continue to produce good fruit for a longer period.

EARLY VINERY.—Continue to tie down and pinch out laterals, and thin the berries. Be careful with the ventilation, as, after the sunless weather we have experienced, a sudden burst of sunshine may do irreparable damage. On fine mornings it will be [illegible] to give a little ventilation quite early. Maintain a gradually increasing temperature as the berries increase in size, and according to the state of the weather outside. In succession houses disbud as soon as one is able to discern the best placed shoots and bunches, and syringe the rods twice daily in [illegible] weather.

EARLY PEACHES AND NECTARINES.—Tie in the shoots as they grow, and fill any blank spaces, training shoots in from the base as much as possible. Thin the fruit where unduly plentiful, and have the foliage syringed twice daily. The late house will now be in flower, and should be treated similarly to the preceding one, as regards setting, etc.

STRAWBERRIES.—Continue to introduce fresh batches in order to keep up a succession. Clean plants and pots before housing them, and as soon as the roots are extending freely feed with liquid manure, and syringe well on all favourable occasions. Should aphis make its appearance, fumigate at once.

MELONS.—Successional plants should be shifted into larger pots if the house is not ready, as a few days too long in small pots may easily ruin the prospects of the crop. A good sowing should now be made for the summer crop. This will provide good strong plants to be put out in frames, etc., when these latter are emptied of bedding plants. Sutton's Scarlet and Windsor Castle, H[illegible] born Favourite and Carter's Hardy [illegible] are good varieties; the latter can be grown quite nicely in almost cold frames, and to growers who have not much room I recommend it strongly, as it is a free setter and grows fair-sized fruits.

CUCUMBERS.—Top-dress these as often as the roots show through the soil, and at this stage cut the fruits as soon as they are large enough. Root out old plants, and give the house a good cleaning, giving the [illegible] and wood and iron work a dressing of petroleum to make sure that no pests are left before making use of the house again.—W. [illegible] COOK, Leonardslee Gardens.

THE KITCHEN GARDEN.

POTATOES.—When the ground is in a dry, workable condition, proceed with the planting of the main crop of potatoes. The penetrating frosts of March will have had a good effect upon land, and, given a genial temperature, growth should be soon [illegible] and satisfactory. Unless the soil has been amply prepared, a dressing of bonemeal and wood ashes, spread along the rows [illegible] planting, will be of advantage to the [illegible]. Robust growers, such as Up-to-Date, Duchess of Cornwall, and Triumph, should not be placed nearer than 2ft. 6in. from row to row to ensure a strong top growth.

CARROTS.—The principal sowing of [illegible] crop may now be made. If possible select a rather sandy site that was trenched and manured early. In many gardens the [illegible] falls a prey to wireworm and other [illegible], and it is important to grow the young plants vigorously from the start. Apply a dressing of wood ashes or soot to the surface of the bed, and work it in during the [illegible] for sowing by lightly forking or raking [illegible] soil down to a fine condition. [illegible] should be drawn out from 12 to [illegible] apart, and the seed sown about [illegible] thicker than the plants will stand, [illegible] for failures. For supplying a private [illegible] lishment the intermediate type [illegible] more suitable than the larger and [illegible] kinds.

TOMATOES.—Where the [illegible] well out of doors pot on a batch of [illegible] readiness to put out along south [illegible] walls at the end of May. Two plants [illegible] pricked out into each 60-sized pot, and the pair potted on as required into [illegible]. These, if grown sturdily in an [illegible] temperature until well established, [illegible] afterwards given a light, cool [illegible] will [illegible] gradually harden them off. [illegible] able condition for planting. M[illegible] Sunrise, and The Cropper were the [illegible] lific with us last year, especially the two first-named.

BEET.—This is not hardy enough to stand much frost. To produce the earliest roots for the salad bowl, make a small sowing of the turnip-rooted variety on a high and sheltered border.

CAULIFLOWERS.—The plants that were raised under glass, and have been duly pricked out and hardened off, may now be planted out in prepared ground. If a sunny border can be given them this position is to be preferred, and early heads of cauliflowers will undoubtedly be appreciated this season. Avoid unnecessary check to the plants in transferring them, by giving a thorough soaking of water before removal, and taking out each plant with the trowel, with a ball of earth adhering to the roots. Neglect in carrying out this detail may result in the plants prematurely buttoning, and they are then of comparatively little value. A distance of about 18 inches apart will be sufficient for this planting. Water should be given according to the condition of the ground.

VARIOUS.—Owing to the ground being in a frozen state during last month, the usual amount of progress with seed sowing has not been made in the kitchen garden. Therefore it will be found necessary to push on with the arrears of work, as time will permit. Make sowings of Brussels sprouts, broccoli, kales, and other winter greens, in the open. Plants of lettuce that have been pricked out in cool frames should be planted outside. Seakale throngs may now be put in. Sowings of radishes, mustard and cress, etc., may from this date be made in sunny positions under the protection of a wall or handlights. — Chas. Flack, Cholmondeley Castle Gardens.

LEONARD'S WATER AVENS.

Almost every one acquainted with our native wild flowers knows well the Water Avens (Geum rivale), which, with its drooping flowers and ornamental leaves, adorns many a brookside and moist place throughout our country-side. Ornamental as it is, however, there is a variety which is more beautiful still, and which, from its colour, is more suited to the decoration of the garden. It is called in nurseries and gardens Leonard's variety, from the fact that it was introduced by the late Mr. H. Selfe-Leonard, of Guildford, a keen amateur grower of hardy flowers, who afterwards founded the Guildford Hardy Plant Nursery, still carried on in other hands. Mr. Leonard found this variety in Norway, I believe, and it has attained considerable favour in the eyes of hardy plantsmen.

When in leaf only it does not differ from our own wild Water Avens, but when the flowers appear and open the difference is quite apparent. Like the native, it has many flowers drooping from stems of some length in considerable numbers, such as are fairly well described, so far as quantity is concerned, by the term "sheaves of flowers." The blooms, however, are of a bright red, and are much more effective than those of the ordinary G. rivale. To see the full beauty of the flower itself it must be turned up, but the value of this avens does not lie so much in the individual flowers as in the whole effect of the plant, with its pendulous red blossoms. The height of Leonard's Avens is from a foot to a foot and a-half, this depending upon the soil and the amount of moisture. Although evincing a preference for moisture, the Water Avens grows in dry soil as well, and Leonard's variety is quite as suitable for rockeries and borders as for the stream or the pond-side in wild gardens. It is thoroughly hardy, and is increased by division.

S. Arnott.

GRAFTERS AND GRAFTING.

In the orchard counties in the West of England the local grafter is a man of some importance. For the greater part of the year he is a commonplace individual, and gets his living in varying ways, but, like the Kentish hop dryer in September, he rises above the level of his fellows, with the exception that his season of importance is the spring, when Farmer Jones has headed some apple or pear trees back in his orchard, and wants them grafted. He sends for the local grafter, and, when engaged in his favourite occupation, the man ceases, for the time being, to be a labourer, if that is his regular occupation, and assumes the air of an individual who is in possession of certain expert knowledge, and is aware of the fact. In short, he becomes a craftsman, and goes about his work in a slow, measured way, that will not brook interference or hurrying. He accepts responsibility cheerfully, puts on the grafts with confidence that he is doing it in the right way to ensure them growing, and if they don't he is quite prepared to be grumbled at.

Grafting, like mole catching, seems to run in the blood, and, generally speaking, the local experts are sons of fathers who were master hands at the work in their young days. As a rule, the local grafter is not a man of many words, and is reticent as to when and where he acquired his skill. Apparently it grew with him, and, unless he has a son to follow in his steps, the countryside is a grafter the less when he is called upon to lay aside his tools. He boasts of no scientific knowledge, and, indeed, he looks on horticultural teachers and lecturers with a critical eye, having no faith in them or their ways. He may have reasons for his aspect of antagonism, fearing, maybe, that if every youth in the village learnt to graft his occupation would be gone. Without knowing it, however, the man is scientific, for though any talk about cambium layers is so much Dutch to him, he has learnt by experience and observation the conditions that are essential for the union of stock and scion, and where he scores is that his grafts invariably grow. If he had all the scientific knowledge about fruit that the world possesses his success in grafting could hardly be greater than it is, and, without knowing it, he has learnt the very lessons that science would teach him.

The principle of grafting must, of course, be always the same, but methods vary considerably, and every local grafter has a way of his own, and it would be a strong power indeed that would ever induce him to alter it. One man believes in cleft grafting, and, without wasting time in argument as to why it is the best method, simply informs you that it is his way, and there's an end of it. Another believes in rind grafting, and assumes just the same firm standpoint of a man who is convinced, and, whether you agree with him or not is not a matter that troubles him. The strong point of the local grafter, however, is workmanship. Watch him amongst the branches of a tree, see how carefully he saws the limbs and smooths the cut ends, with what neatness and precision he makes the incisions, prepares the grafts, and inserts them so that they make a perfect fit, and the inner barks are brought into close contact with each other. This is where the non-scientific local expert scores his triumphs, and after the scions are in place he is careful to exclude air, and keep them moist. For this purpose he not infrequently scouts the idea of wax as being a new-fangled idea, and sticks to the time-honoured clay ball, but he has a knack of kneading up the material in such a way that it does not crack or fall away. Wax may be handier, quicker to apply, and cleaner, he does not gainsay it or argue the point, but clay is good enough for him, and there's an end of it. His conditions of employment vary, and, whereas he is sometimes engaged by the day, he prefers, on the whole, to put on grafts at so much a score, and accept the responsibility of their growing. He brings his own tools, heirlooms most of them, that have been in the family for a long time, but his knife and chisels have the merit of being made of steel. Indeed, it may be said of the local grafter that he is an extremely useful individual, and there are few orchards in his district that he has not had a hand in making. During the spring he is important, and has many calls on him, and when the grafting season is over he sinks back to the level of his fellows, and takes up the occupation which keeps him for the rest of the year, having earned a few extra shillings while engaged on expert labour.

In reference to this man and his work, I say, would that there were more of his kind about, and would that farmers and fruit growers were more ready to employ them. In British orchards to-day there are hundreds of trees that are simply encumbering the earth; sturdy, stout specimens many of them are, as trees, but the varieties are useless, being small, insignificant, of no commercial value, and little good in the cider mill. What is the good of keeping such trees? What, indeed, and yet there is some unexplainable sentiment which seems to protect them, and they are allowed to live on. Cut them down (did someone say), and plant fresh ones? Not a bit of it: such a course would be a waste of time and material, so long as there is a man in the parish who knows how to graft. By cutting down the sturdy useless tree and planting a fresh one the grower must wait ten or more years perhaps before he sees a return on his outlay, but by heading back the existing tree and grafting it with a good variety he gets a fine spreading and bearing tree in half the time. "This is an art," said the Bard of Avon, "that doth mend Nature, change it rather, for the art itself is Nature." It is quite true, and the way to alter the character of a tree and turn an unprofitable specimen into one that will help to pay the rent or fill the cider casks is to graft it. Why is the art of grafting then not taken more advantage of? Why, indeed? It is owing, perhaps, to that spirit of letting things go which prevails so much in the orchard counties of England. When many of the old orchards were established it did not matter so much. The apples were chiefly grown for domestic use or to make cider for the men, and the trees were chiefly raised from seeds. This accounts for the presence of so many local and inferior varieties, which have no value to-day, or next to none. But we have grand apples of the Bramley's Seedling type that seem to have the power of rejuvenating the trees they are worked on, and if scions of the above were used, profitless trees in scores of orchards could be changed into rent-paying institutions. We have evidence before us of what has been done, and realise what might be done by practice of the art which Shakespeare wrote about, and employment, if necessary, of the local grafter.

H.

NEW PLANTS, ETC.

DENDROBIUM SCHNEIDERIANUM WESTONBIRT VAR.

This is a very attractive form of the hybrid derived from D. aureum and D. Findlayanum. It grows and flowers very freely. The sepals and petals are white, shading to rosy-purple at the tips, and the lip is white with a rosy-purple margin and a rich orange disk and throat. A.M., R.H.S., March 23. Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Tetbury, Gloucester. (See illustration p. 251.)

BRASSO-CATTLEYA DIGBYANO-MENDELI PERFECTA.

In this beautiful variety the fine sepals, petals, and lip are all of a delightful silvery pink or blush colour, the labellum having a pale yellow disk and requisite marginal fringing. A.M., R.H.S., March 23. Lieut.-Col. Holford.

SOPHRO-LÆLIO-CATTLEYA OLIVE.

This very handsome orchid has been obtained by crossing Sophro-lælia Psyche with Cattleya Enid. The flowers are of fair size, and borne three together, on an erect spike. The colour is rich rose-tinted crimson, with golden-yellow markings in the throat. A.M., R.H.S., March 23. Mr. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford.

BEGONIA SATURNE.

A fine begonia for conservatory decoration at this season of the year. It is probably a form of or descendant from B. hydrocotylifolia. The leaves are very deep green, thick, lobed, and rather large, but they make up a very handsome plant. The flower spikes rise erect, from 15 inches to two feet high, and the red stems carry large clusters of soft pink flowers. In many cases the plants carried upwards of a dozen spikes. This very novel, attractive, and useful begonia can be easily grown in an intermediate house. A.M., R.H.S., March 23. Messrs. H. Cannell and Sons, Swanley.

CARNATION ROSE DORE.

We figured and described this handsome rosy-scarlet perpetual flowering carnation towards the end of last year, when it gained a certificate from the Perpetual Flowering Carnation Society. It is a variety of bright colour, and has fine long stems. A.M., R.H.S., March 23. Mr. W. H. Lancashire, Guernsey.

ROSE RHEA REID.

As already indicated in these columns this new hybrid tea rose, introduced by the American firm of E. G. Hill and Co., was the best rose in the trials held in the Bagatelle Gardens, Paris, last year. It is a fine grower, and produces handsome deep rosy-crimson flowers with a purple tinge. The buds are rounder than those of Liberty, a variety to which it has been likened. A.M., R.H.S., March 23. Mr. G. W. Piper, Uckfield, Sussex.

PTERIS AQUILINA CONGESTA.

This is an attractive and very distinct form of the common bracken. As shown it was about a foot high, and, at a short distance, it suggested a selaginella. The fronds are very dense and compacted, and set in no sense inelegant. Being dwarf, compact, and of a rich green hue, this new comer is likely to be popular with lovers of hardy ferns. F.C.C., R.H.S., March 23. Messrs. H. B. May and Sons, Edmonton.

CINERARIA STELLATA, CACTUS-FLOWERED STRAIN.

This strain produces very handsome plants and grand heads of starry flowers, of various colours. The blooms have ray florets with rolled margins, that suggest tiny cactus dahlias, so far as shape is concerned. In the present issue we figure a plant of this strain. A.M., R.H.S., March 23. Messrs. Sutton and Sons, Reading

CROCUS SIEBERI VERSICOLOR.

A charming variety of this beautiful crocus, with a yellow base and three white inner segments. The large outer segments are white, finely feathered with bright purple. The orange-coloured stigma is very attractive against the white and purple. A.M., R.H.S., March 23. Mr. G. Reuthe, Keston, Kent.

MAINCROP PEAS.

The production of first-class peas during the summer and autumn months is of such importance that one may be pardoned for giving further details as to their cultivation, which, of course, are intended for the less experienced. It is quite easy for anyone possessing a garden to sow a row or two of peas, and to have a certain amount when everyone else has them, but it is quite another matter to keep up a continuous supply all through the season. It therefore behoves every gardener to do his utmost to supply this want, as good, fresh green peas are certain to be appreciated.

Preparation of the Soil.

The first and most important point in relation to success is the deep working of the ground, and this is best done during the winter months. Garden peas delight in a good deep root run, and when the soil is properly prepared and plenty of manure added it is surprising to what a great depth the roots will travel, especially during long spells of drought. It is most essential that this crop should not be grown two years in succession on the same site, and, indeed, it is advisable, if possible, to allow a break of two years between the pea crops on any particular quarter. The more open the position for peas the better. It is a capital plan, and is now practised by very many, to prepare trenches to a good depth, much in the same way as for celery, the bottom of which should be deeply forked up, and a good quantity of partly decayed manure placed in the bottom. And the soil excavated should be left until the time of planting or sowing the seeds. These trenches should be taken out, if not already done, without further delay. The distance of the rows will, of course, very much depend on the space at command, but, wherever possible, it is advisable to allow a good distance, and cultivate some other low-growing crop between them.

Raising the Plants.

I have for many years practised raising peas in boxes under glass, thoroughly hardening them off, and planting them out singly when about three inches in height. I have found this to be a great gain, especially on wet, cold soils, as well as having them under better control, and I have found them to bear much more prolific. We raise the plants in this manner till about the first week in April. After that date the seed should be sown just about as thick again, as these sowings are intended to remain, and be thinned out to the proper distance when quite small. Here it may be well to point out that in far too many cases maincrop peas are grown much too closely together. As the result, the plants do not have room for their development, and the pods fail to reach their full size. Moreover, the plants rapidly decline in vigour, and fail to continue in bearing for so long a period as could be desired. Naturally, the more robust the variety the greater should be the distance between the plants in the rows.

Staking.

I know of no better method for supporting the plants than good ordinary brush sticks, hazel for choice, and these should be new each year if possible. The sticks should be thrust well into the ground close to the rows, and be quite straight. The tops should be taken off and placed between the stakes to support the young growth in its first stages. Soot is an excellent stimulant, and should be applied at frequent intervals during showery weather. Where slugs abound give a good surface dressing of finely sifted cinder ashes; and where sparrows are likely to injure the young growths protect with garden netting at the time of staking.

Mulching and Watering.

No crop pays better than peas for applying a good quantity of stable litter between the rows, especially during the hottest [illegible] of the year, and water should be given [illegible] abundance, both clear and liquid manure. During hot weather spray the haulm freely the best time being late in the afternoon and use clean, tepid water.

Stopping and Thinning.

When extra large pods are required, whether for exhibition or other purposes, it is most essential to stop the points of the growths after a reasonable amount of pods have set, and all lateral growths should be removed also. During wet seasons it is often advisable to practice this to induce the pods to fill rapidly.

Varieties.

If one were asked to name the very best varieties in cultivation it would be a difficult matter to do so to please everyone. It frequently happens that a variety which does exceedingly well in one particular district is anything but satisfactory in another. Nevertheless, there are some which seldom fail in any locality, but with so many first-class peas now in commerce none should be cultivated unless they are of the highest quality. As I am dealing only with maincrop varieties, I will [illegible] out those which are generally classed [illegible] early ones entirely. Duke of Albany [illegible] first-class pea, and worthy a position [illegible] any garden. To follow this Prodigy is excellent. Then Alderman and Quite Content, the latter being a grand pea for any purpose, and continues to bear longer than any other variety I know, providing [illegible] allowed plenty of room, and the ground [illegible] good. Essex Wonder and Essex Rival [illegible] both grand peas of medium height. Masterpiece and Autocrat are still hard to [illegible] pass for late supplies, as each [illegible] fine constitution, and seldom mildew, [illegible] not overcrowded, and plenty of [illegible] given. These will frequently [illegible] bear good crops till quite late in November.

E. BECKETT

Aldenham House Gardens.

SUPPORT FOR SWEET PEAS.

Mr. Curtis mentions various forms of [illegible]ports for sweet peas on p. 231, but he does not mention larch tops, possibly because he thinks they are not easily obtainable. That may be so in many cases, but they form a capital method of supporting the haulm [illegible] the plants. Here, these tops can be had [illegible] any length to suit varieties and growth, from 6 feet to 12 feet, or even higher. [illegible] during the winter, before the buds burst, they have a distinct rustic appearance, and with the side branches cut back to [illegible] foot of the main stem all round, [illegible] vide ample space for the most robust growing varieties.

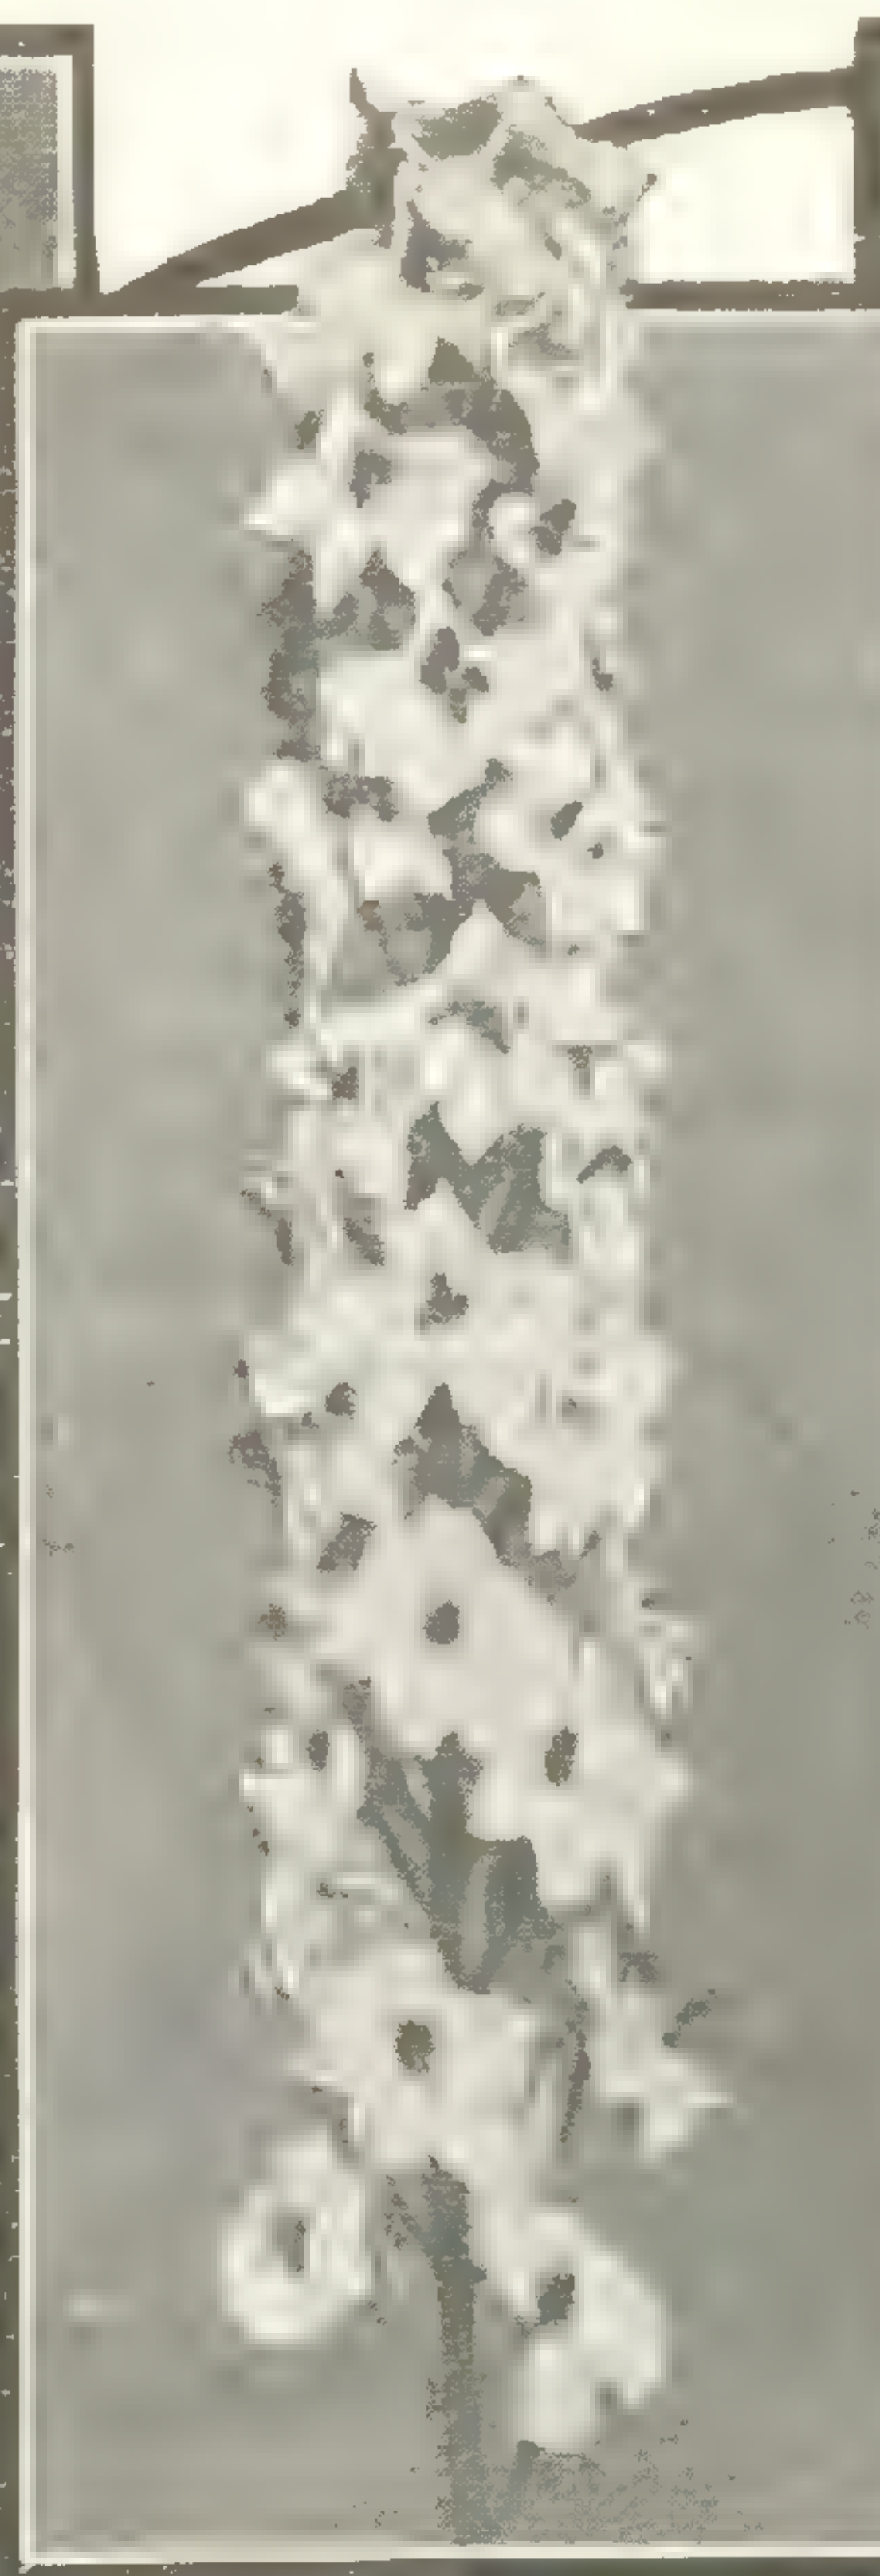
Before sowing in the open, or putting out the plants from pots, these supports should be fixed by boring a hole in the ground with an iron bar, into which the pointed base [illegible] support should be thrust and made [illegible] the sweet peas commence to climb [illegible] should be evenly spread out, covering the whole of the support eventually, and when this complete, an almost perfect clump is thus obtained.

E. MOLYNEUX

IRIS GERMANICA.

Supply the most beautiful and effective yellow, rose, purple, and blue blooms during May, June, and July.

12 distinct varieties - -	**5/-**
50, in 12 varieties - -	**18/-**



MAJESTIC DELPHINIUMS.

One of the most telling subjects. Their strong flower spikes, 6 or more feet high, in every shade of blue, are most effective during June, July, and August.

12 distinct varieties - - - -	**7/6**

50, in 12 varieties - -	**33/-**

HELIANTHUS.

From August to October provide a glorious display of rich golden yellow flowers most useful for cutting.

12, in 6 varieties - -	**6/-**
50, in 6 varieties - -	**21/-**

To that great army of enthusiasts whose leisure is limited.

EASY culture and extreme hardiness, allied with bloom-producing qualities of the highest degree of excellence in colour, shape and size distinguish this collection of five. Where such a desirable combination exists, gardening becomes a REAL recreation, not an unwelcome extension of the day's work; a minimum expenditure of time and labour is rewarded by a maximum of results.

Choose your own position for any one of the five. PLANT THE WHOLE OF THEM NOW in ordinary garden soil, and, without any heavy demand on your time or knowledge, next summer, and many summers to come, will see a living mosaic of glowing colours in your garden.

Coming from York Nurseries, the headquarters of hardy plant culture in this country, each plant is necessarily a picture of robust health, requiring only air, water, and a moderate amount of sunshine for development.

Send your order along to-day. Packing free for cash; carriage paid on lots of 10/- or over in value.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, March 23.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Sir Daniel Morris, K.C.M.G., Dr. Rendle, Messrs. R. H. Curtis, G. Massee, J. Douglas, H. T. Güssow, J. T. Bennett-Poë, W. Fawcett, A. Worsley, F. J. Baker, G. Saunders, and F. J. Chittenden (hon. secretary). Visitors: Messrs. F. W. Smith and G. Wilson, F.L.S.

ROOTS OF SWEET PEAS DYING.—Mr. Massee reported that he had examined the roots of the sweet peas sent to the last meeting, and had found that the cortical cells and root hairs were all killed and browned. He thought they were perfectly free from any disease due to insects or fungi, but had probably been injured by some injurious substance in the soil, or by some fertiliser. Possibly peaty soil with sphagnum had been used, and humic acid had caused the damage.

PARSNIPS FROM WILD STOCK.—Mr. F. J. Baker showed some roots of parsnips of the sixth generation from the wild plants. The roots were of good size, although grown on poor land, and had lost the greater part of the tough woody fibre of the original stock. In form they showed a near approach to the well-known "Hollow-crown" type of parsnip. Mr. Baker said there was just a possibility that the plants had in one generation been crossed with pollen from cultivated plants. He found the roots far less liable to rust than the ordinary plants, though they were not entirely free from it.

ORCHID MALFORMATIONS.—Mr. Gurney Wilson showed malformed flowers of Odontoglossum Harryano-crispum on behalf of Mr. W. Bolton, of Warrington. There appeared to be symmetry about the multiplication of parts in these flowers, and Mr. Wilson remarked that, as in the present case, when a portion is removed from an established plant, in the next season it is not very unusual for the older portion to bear malformed flowers, while the portions removed bear normal flowers. He also showed a flower of Selenipedium caudatum var. Lindeni, from Messrs. Charlesworth. In this variety the labellum is not slipper-shaped as in the type, but is replaced by a very long and tapering petal entirely similar to the two lateral petals; there are also three fertile stamens. The variety was figured by Reichenbach (Lindl. Orchid, Linden, 28, 1846), under the name of Uropedium Lindeni. The form occurs wild.

EUCROSIA BICOLOR.—Mr. J. T. Bennett-Poë showed flowers of this peculiar plant from Miss Willmott's garden. The plant was figured in 1817 in the Bot. Reg. t. 207.

GREASE BANDS.—Mr. Walter Voss reported that no winter moths of any kind had been caught on the grease bands placed on the fruit trees at Enfield since the end of November.

DISEASED PLANTS.—Mr. Massee showed a piece of a rose stock attacked by the fungus Leptosphæria diplodia, a well-known fungus on the stems of the Dog Rose, and rarely attacking the cultivated varieties. In this case 15,000 bushes had been affected. Mr. Massee also showed shoots of apple affected by the winter stage of the apple scab, Fusicladium dendriticium. Mr. Massee also showed a branch of pear which had been damaged by hailstones in the summer. The wounds had healed, and were now free from danger of attack from fungi, but the circular places which had been hit by the stones had dried, and were sunken and black.

DAMAGE TO PLANTS BY FROST.—The desirability of drawing up a report upon the damage done by the frosts of the past winter was discussed, and some points upon which it seemed desirable to obtain information were decided upon.

Beckenham Horticultural Society.

On Friday, the 26th ult., Mr. Alexander Dean, V.M.H., lectured before the above society on "Auriculas and Polyanthuses." Mr. Sherley-Price, one of the vice-presidents, occupied the chair. There was a capital attendance, and the lecturer was very attentively followed as he gave the history of the auricula, and explained the various points that go to make up perfect flowers and plants. Mr. Dean appealed for an extended use of the alpine auricula and polyanthus for beautifying the flower borders in spring, and also showing that there was plenty of room for workers to take up the improving of the garden section of these plants by cross-breeding and selection. The compost for the show auricula given by the lecturer was good fibrous loam four parts, one part of old hot-bed manure, one of good leaf-soil, and a good sprinkling of coarse sand. The best time to sow seed of polyanthus is soon after it is ripe, and to sow outside. These form finer plants at flowering time than those sown at this season of the year.

Very hearty thanks were accorded Mr. Dean for his most entertaining and instructive lecture. This being the last lecture of the session, the Chairman kindly distributed the various certificates awarded during the session, and was warmly thanked for presiding over the meeting.

Birmingham Gardeners' Association.

A more than ordinary interest was aroused amongst the members of this association on March 22, in view of the subject, as evidenced by the well-filled lecture-room at the Athletic Institution, John Bright Street, when Mr. C. B. Bick, Bickenall Nurseries, Olton, brought a most interesting set of lantern pictures, and accompanied these with graphic and instructive remarks. His subject was "The Embellishment of Suburban Gardens." Mr. Thos. Humphreys presided.

Mr. Bick, who has been a most useful member of the association from its inauguration upwards of twenty years ago, was for a period of at least twenty-five years gardener to Walter Chamberlain, Esq., then at Harborne Hall, Harborne [Harborne Hall Gardens were described and illustrated in our issue of March 13.—ED.] and where he effected great improvements and additions to the pleasure grounds, including the transplanting of very large and fine specimen evergreens, including hollies, yews and other conifers, rhododendrons, and ornamental deciduous trees. The larger specimens of hollies and yews were transported from several miles distant by a transplanting machine, and all with uniform success. The formation of two large ornamental ponds were included in the repertory of Mr. Bick's undertakings. Some four years ago, on the death of his father, Mr. Bick resigned the charge of the gardens and estate to assume possession of the old family nursery at Olton. While at Harborne Hall he developed a penchant to photography, one of the results being the fine set of lantern slides with which his lecture was illustrated.

In the course of his remarks, Mr Bick strongly advised prospective photographists always to keep in view the propriety of keeping to a special object, instead of desultory and unprofitable snap-shotting of every object that might casually arrest attention. It may be added that, in addition to Harborne Hall views, Mr. Bick threw upon the screen several other garden scenes, chiefly shrubberies, rockeries, etc., constructed by himself and brothers for various patrons around Birmingham. In the ensuing interesting discussion, in which Messrs. T. Humphreys, C. H. Herbert, W. Gardiner, Geo. Giles, W. L. Deedman, and James Webb took part, warm eulogiums were tendered to Mr. Bick for his interesting entertainment.

Bristol Gardeners' Association.

The usual fortnightly meeting was held on March 25, at St. John's Parish Rooms, Mr. W. E. Budgett in the chair. The representative of the Reading Association, in the person of Mr. Bailey, gave a lecture upon "Propagation by Layering," with practical demonstration, which, from an educational standpoint, was much appreciated by the members. Mr. Bailey said ampelopsis, aristolochia, clematis, bignonia, honeysuckle, wistaria, aucuba, ceanothus, weigela, cotoneaster, garrya, ivy, and ilex, all root readily if layered, and make good plants in from three to eighteen months; root action is accelerated by tongueing. Heaths, magnolias, rhododendrons, and azaleas require peat as a rooting medium, otherwise there is no difficulty in raising plants from layers.

Numerous questions were asked and satisfactorily answered, and the Chairman's remarks added interest because of his knowledge of hardy shrubs. Mr. Shaddick proposed, and Mr. Binfield seconded, that the secretary write to Mr. J. Attwell (the first chairman) assuring him of the members' high appreciation of his interest and help since the society was first inaugurated, and wish him continued success in his new place, as gardener to the Misses Brain (with whom he has been for many years) at Brent Knoll, Somerset.

For "spray and button-hole" (under-gardeners only), Messrs. Dainton, Whiting, and Isaac won in the order given. Ordinary certificates were awarded to Messrs. Holt and Young, the former for Stanhopea oculata, the latter for a grand star cineraria.

Reading Gardeners' Association.

There was again a very large attendance of members of this society in the Abbey Hall on Monday, March 22, when Mr. T. J. Powell, of The Gardens, Park Place, Henley-on-Thames, a popular member of the association, was the lecturer, and his subject, "The Value of System in the Cultivation of Fruit." The President (Mr. Alderman Parfitt) [illegible] the chair. Mr. Powell announced that he did not propose to give a lengthy paper, his remarks would rather be directed to provoke an instructive discussion. He then proceeded to demonstrate how without [illegible] system the successful cultivation of [illegible] trees would be altogether impossible, [illegible] out that system must be observed at the [illegible] set, even in the selection and [illegible] trees, afterwards rigidly adhered to [illegible] ing, manuring, spraying, pruning, [illegible] gathering, grading, storing, etc. Mr. Powell certainly had no reason to be disappointed in the avowed object of his paper, for one of the best discussions that has [illegible] taken place in the Abbey Hall followed his remarks, a very large number of [illegible] taking part.

GARDENS FREE FROM INSECT PESTS.

Gardeners now have in "KILOGRUB" a thoroughly effective destroyer of all kinds of soil pests.

After the most complete experimentation, scientific chemical research has produced **the right thing** for exterminating the destructive wireworms and all manner of insect pests which ruin crops and plant life.

The deadly efficacy of this preparation which has been given the name of "Kilogrub," has been proved emphatically by numerous tests under every imaginable condition—on pest-afflicted crop land, in suffering gardens, and under glass.

"KILOGRUB" is a chemical powder, and emits, when worked well into the soil, fumes which infallibly destroy every insect pest that the soil contains. The very nature of "KILOGRUB" makes only from two to three ounces necessary for each square yard. It is not only most effective in action, but most economical to use—a fact which means a great deal to the average farmer.

Many useful hints for the use of "KILOGRUB" are given in a free booklet which will be sent you on request.

Hundreds of gardeners have used "KILOGRUB" with success.

Send for a trial supply of

KILOGRUB to-day.

As an object lesson, too, Mr. Powell staged 42 dishes of apples in perfect condition, a truly remarkable exhibition at this period of the year (March 22), showing that the system of storing at Park Place is such that all gardeners might envy.

The following were the varieties exhibited: Annie Elizabeth, Duke of Beaufort, Court of Wick, Blenheim Orange, Baddow Pippin, Winter Majetin, Worcester Pearmain, Dr. Eclat, Mother Apple, New Ribston Pippin, Adams' Pearmain, Cockle Pippin, Striped Pearmain, Margil, Winter Greening, Winter Hawthornden, Late Nonpareil, Alfriston, Hoary Morning, Lord Derby, Wellington, Alexander, Bismarck, Flower of Kent, Cox's Orange Pippin, Lane's Prince Albert, Tower of Glamis, Teddington Seedling, Old Ribston Pippin, Golden Russet, French Crab, Gloria Mundi, Scarlet Nonpareil, Cox's Pomona, Striped Beefing, Sandringham, Kedleston Pippin, Strawberry Pippin, and others.

At the conclusion of the meeting a vote of thanks to Mr. Powell was carried with acclamation.

Mr. J. Wynn, head gardener to Lady Cooke, East Thorpe, Reading, staged a really magnificent group of amaryllis from seed sown in 1905 and flowered now for the first time. The exhibit was awarded the association's certificate.

Mr. G. Carter, gardener to S. Griffith, Esq., showed some very fine blooms of Sutton's Giant primulas, and Mr. A. F. Bailey, gardener to H. Collins, Esq., exhibited a dish of pears, which showed that his system of storing fruit was of the correct order. Seven new members were elected.

British Gardeners' Association.

At the recent monthly meeting of this association, Mr. E. F. Hawes in the chair, 41 new members were elected, bringing the total up to 1,473. Mr. Chas. Foster was congratulated on his new appointment to Lord Northcliffe. It was decided that the annual general meeting of the association should be held at Essex Hall, Essex Street, Strand, W.C., on Wednesday, May 26, at 7 p.m., the second day of the Temple Show.

DESTRUCTION OF VERMIN.—Most gardens are pestered with Rats and Mice. Every effort should be made to exterminate them before seeds are sown. Danysz Virus is first rate stuff for killing these vermin. Single tube, 2s.; three tubes, 5s. Post free from DANYSZ VIRUS, LTD., 52, Leadenhall Street, Garden Dept. London, E.C.—[Advt.]

ANSWERS TO CORRESPONDENTS.

DEAD TEA ROSE.—N. T. H., Hertford: The specimen sent is quite dead, and if all the others are like it you must pull them out, because they are useless. Later on you may plant out roses that have been grown in pots, propagated early under glass.

DAMAGED H.T. ROSES.—C. S. D., Lincoln: Where tea and hybrid tea roses were not protected during the long and severe winter of 1908-9, there will be many losses to record. We cannot tell how severely your plants have suffered without seeing them. About the end of next week examine the plants carefully, and probably you will find sound wood and live eyes quite at the base of the growths; if so, prune right back to a live eye; if not, then root out the plants; because, while the stock may be alive, the rose will be dead.

RUSTY CYCLAMEN LEAVES.—A. B., Ashbourne: We find no trace of mite on the little leaves sent, but there was a suggestion of thrip on the smallest leaf. There is something about the substance of the leaves that is not pleasing, and it suggests an unhappy condition of the roots. Make a careful examination, and, if necessary, wash the roots clean and repot in sterilised light soil. Use tobacco powder on the leaves.

FAILURE WITH PELARGONIUMS.—G., Royston: The failure appears to be due to a rather sudden change of conditions. No doubt the cuttings in the store pots were kept fairly dry all through the winter, and, when potted off singly, were at once subjected to warmer and moister conditions. This, coupled with the dull, cold weather prevailing, acted as a severe check. It would have been better had the plants been given rather warmer and moister conditions for a little while before repotting, so that new growth and new root action would have commenced. The constitutional vigour of some varieties is much greater than that of others, even though in some instances the variety may not be nearly so strong in growth. The size to which a variety will grow is no criterion of its vitality or its ability to resist disease; indeed, some of the strongest, rankest growers among florists' flowers are among the first to succumb to checks. Obtain your cuttings from a new stock in the autumn from a considerable distance, if possible. We are persuaded the difficulty is a physiological one, and not due in the first place to either fungus or insect attack.

WHITE SPOT ON CUCUMBER LEAVES.—S. S., Hendon: Without specimens we cannot be certain what the disease is, but it is probable that the white spots are caused by a fungus known as Cercospora Melonis. Cut off and burn the affected leaves, and spray the plants with weak Bordeaux mixture.

WEED IN ASPARAGUS BED.—T. H., Corbridge: Unfortunately, or, perhaps, fortunately, we cannot persuade the roots to grow, and therefore we cannot identify the plant that is a weed in your asparagus bed. It is possible the weeds were in the asparagus roots at planting time, but it is still more probable that the bed contained the weed seeds, and though weeds were pulled up between the plants, the desire to avoid damage to the asparagus crowns gave some of the weeds a chance to make their long roots, and establish themselves. You have done the right thing in trenching out, cleaning, and replanting the asparagus, and if you have not allowed the weed to seed during the last two years, then you should find little difficulty in future. If a weed should escape your vigilance, please send it to us when in flower.

FRAU KARL DRUSCHKI ROSE.—F. W., Stourbridge: Remove the few thin weak growths entirely, then take the strongest shoots, and, after shortening them a little, arch them over and secure them to pegs about a foot high. Arch over as many of these shoots as there is room for in the bed, allowing fair space between them, and then shorten the remainder back to about fifteen inches. By this means you will secure a good effect when the roses bloom. "Pegging down," as applied to roses, does not mean laying the growths flat upon the ground and keeping them there by means of pegs, but consists of bending over the growths, as suggested, and keeping them in position by tying them to stout pegs or sticks; or, if hooked sticks are obtainable, by putting the end of the growth under the hook, so as to keep it about a foot from the ground.

NAMES OF PLANTS.

N. T., Salisbury.—1, Cornus mas; 2, Lonicera Standishi.

W. S., Trowbridge.—We believe your specimen represents the true Eupatorium petiolare.

F. S. E., Wallingford.—1, Eupatorium ianthinum; 2, Hibbertia dentata; 3, Acacia armata.

A. S. R., Richmond.—1, Bulbocodium vernum; 2, Saxifraga apiculata; 3, Cyclamen coum; 4, Chionodoxa Luciliæ.

M. E. M., Cardigan.—1, Rhododendron arboreum; 2, apparently Campanula persicifolia, send when in flower; 3, Desfontainea spinosa.

T. C., Greenwich.—1, Dracæna indivisa; 2, Francoa ramosa; 3, Cœlogyne cristata; 4, Anthericum variegatum; 5, Ophiopogon jaburan.

OBITUARY.

MR. WILLIAM ROUPELL.

We have to record the death of Mr. William Roupell, which occurred at his residence in Christchurch Road, Streatham, on the 25th ult. Mr. Roupell, who was in his 80th year, was, at the time of his death, president of the Brixton Horticultural Society, and a member of the committee of the Royal Gardeners' Orphan Fund.

FORTHCOMING ENGAGEMENTS.

TUESDAY, April 6.—Royal Horticultural Society; Narcissus Committee, at 11.30 a.m.; Orchid, Floral, and Fruit Committees, at 12 o'clock; lecture at 3 p.m. on "Effects of the Forces of Growth," by Rev. Professor G. Henslow; Scientific Committee, at 4 o'clock.

British Gardeners' Association, Council Meeting.

WEDNESDAY, April 7.—Royal Caledonian Horticultural Society's Spring Show; two days.

Royal Society of Arts meets.

THURSDAY, April 8.—Liverpool Horticultural Association's Spring Show.

FRIDAY, April 9.—Good Friday.

. Owing to great pressure on our space, our usual Market Report is unavoidably held over.

CLAY'S MANURES, CRUSHED BONES
(See page x.)

CLAY'S FERTILIZER is
UNSURPASSED for all Horticultural Purposes.
CLAY and SON, Stratford, E.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

BLACKMORE and LANGDON'S BEGONIAS for BEDDING

A GREAT SPECIALITY.

Special Named Doubles for Bedding.

ARGUS.
Makes a carpet of scarlet unequalled by any other bedding plant. 12/- dozen, 84/- per 100.

GLADIATEUR.
Rich crimson; very effective. 12/- dozen, 84/- per 100.

HILDA (New).
Deep salmon, with lighter centre, perfect camellia form; vigorous, and of grand habit. 15/- per dozen.

LORD LANGTON.
Bright scarlet; wonderfully free blooming. 10/- per dozen, 70 - per 100.

MARQUIS OF STAFFORD.
Crimson; a well-known and first-rate variety. 12 - per dozen.

DOUBLE BEGONIAS, Seedling Tubers.
These are of splendid quality, and as our strain possesses an upright habit, which is indispensable in a bedding plant, they are grand for bedding. We offer the following colours: White, blush, pink, rose, scarlet, crimson, yellow, orange. 4/- per dozen, 30 - per 100.
In Mixed Colours, 3/- per dozen, 21/- per 100.

SINGLES, Seedling Tubers.
These are of superb quality, and are unequalled for habit and richness of colouring, in the following colours: White, pink, rose, scarlet, yellow, crimson (a special line), and orange, 3/- per dozen, 21/- per 100.
Mixed 2 6 per dozen; 15 - per 100.

FRILLED SINGLE BEGONIAS.
These have created a sensation wherever we have exhibited them the last two seasons. 4/-, 8 -, and 20 - per dozen.

NOTES OF THE WEEK.

The Value of Glass Protection.

The value of glass in the cultivation of ornamental plants from tropical and temperate regions, and in the production of crops of choice fruits, is fully recognised both by owners of gardens and those responsible for their management. Hence we see in gardens of any considerable size plant and fruit houses, not always, perhaps, equal to the demands made upon them, but sufficient to show that the aid they are so well able to give is being taken advantage of. This being the case, there is no occasion to discuss the value of glass in the garden in general terms, but there is one aspect of the question that might with advantage be carefully considered at the present time, when, owing to the severe frosts and long period of low temperatures, there is a shortage of seasonable vegetables and salading. This aspect, briefly stated, is the utility of glass appliances of a simple and inexpensive description, and the place they should occupy in the economy of the garden. There cannot be any question as to their being of immense value, or of the necessity of more freely utilising them in sheltering ornamental plants and useful crops. In bygone days, when, for various reasons, plant and fruit houses were but few, except in the principal gardening establishments, the frame ground, with its long lines of low pits and great heaps of fermenting materials, would appear to have been regarded as an important department. We have only to turn to the older books dealing with the practical work of the garden for evidence in support of this view, for we find prominence given to this department, and a number of contrivances described as useful for supplementing the ordinary frames. The most popular of these makeshifts were "turf pits," which differed from those of the ordinary type in having turf walls, for the support of the glass lights. These served a useful purpose in the absence of a sufficiency of properly made frames, and the gardeners of the present day would be able to utilise them not less successfully than did past generations of members of the craft; but we do not suggest the revival of makeshift contrivances, in view of the inexpensiveness of properly made appliances. Many are the choice alpine plants that can be successfully grown with the aid of the shelter that unheated frames so efficiently give; and with a range of frames and a small span-roof house in which to place the plants when in bloom, the lovers of these floral gems may enjoy a succession of their flowers for a considerable period during the earlier months of the year. The usefulness of frames in the preparation of stocks of flowering and fine foliage plants for beautifying the flower garden during the summer months is so well known to those who have had experience in garden management, that we need not do more than refer to it for the purpose of pointing to the great advantage of being able to do this preparatory work without taxing fruit and plant houses. Not only is it advisable that the occupants of such structures should not be crowded up with bedding plants when growth should be most active, but the latter are invariably more healthy and in better condition for making a vigorous growth when transferred to their summer quarters than are those grown for a time in a temperature in excess of their requirements, and then removed outside and protected from unfavourable weather with extemporised contrivances. Useful as are frames, both heated and unheated, in the preparation and the cultivation of various ornamental plants, they are even more valuable in the production of early vegetables and salading. There is no occasion for British gardeners to undergo an apprenticeship in the French market gardens in the neighbourhood of Paris to learn how to produce juicy peas, delicately flavoured cauliflowers, tender carrots, succulent radishes, and crisp lettuce, with the aid of simple appliances. They are more or less acquainted with the details by which the best possible results may be obtained; but, with the aid of the frame room usually provided, but little can be accomplished in giving practical effect to their knowledge. Such frames as are used by the French market gardeners in the production of early vegetables and salading, may undoubtedly be used with excellent results in private gardens; but we do not consider them so suitable as those in general use in this country. Frames wholly of wood and of moderate depth have the advantage of portability, and may at one time be placed on a ridge of fermenting materials and devoted to the production of a crop of some kind that derives advantage from a mild bottom heat, and at another be placed on the north side of a wall and utilised in the raising of seedlings, or the preparation of stocks of plants that are benefited by shade during the earlier stages of growth. If we put on one side the question of portability, frames with brick walls and a depth of thirty inches or three feet are the best. They are neat in appearance and the space about them can be kept tidy, two points of im-

MR. N. MOLYNEUX.
A famous raiser of New Chrysanthemums.

portance in the private garden. With the depths mentioned, it will be possible to make up a bed of leaves or a mixture of these that will yield sufficient warmth to ensure the quick germination of seeds and maintain a steady growth of the resulting plants. Two or three dozen lights of the usual size would provide space in which to produce large supplies of early vegetables and of salading of high quality, and thereby enable those in charge to tide over periods of scarcity. With reference to lettuces it may be said that with the shelter of glass without bottom heat, an abundance of lettuces of high quality can be obtained during the early spring months, and this fact is alone sufficient to justify a considerable addition of the appliances under consideration to the garden.

Mr. N. Molyneux, whose portrait we have the pleasure of giving in this issue, has accomplished so much excellent work in the improvement of large-flowered chrysanthemums that for some years past he has occupied a prominent position amongst raisers of these flowers in this country. It was in the year 1896 that Mr. Molyneux first obtained prominent attention as a raiser by introducing the richly-coloured pink Japanese, Mary Molyneux. This variety he submitted to the National Chrysanthemum Society, and a First Class Certificate was conferred upon the variety, and the award of a silver medal made for twelve blooms. His next success was the pure white Florence Molyneux, which, by reason of the noble proportions, the distinct build, and the great beauty of the blooms, at once attracted the attention of those who take an interest in chrysanthemums. Other noteworthy Japanese varieties raised by Mr. Molyneux are Mrs. Pilkington, Mrs. A. H. Lee, Mrs. T. Dalton, and J. W. Molyneux. The last-named, which was presented to public notice for the first time last autumn, is a crimson variety, that marks a distinct advance in its colour. Mr. Molyneux has raised several excellent incurved varieties, notably Frank Hammond and Nellie Threfall, and some valuable decorative varieties, of which Lady Beaumont and Maud Allan are well deserving special mention. Mr. Molyneux has also had much experience as a cultivator of chrysanthemums, for in the early part of his career he was for several years with his brother at Swanmore Park, and assisted him in winning the many challenge cups that were awarded for blooms grown in these famous gardens. Mr. N. Molyneux enjoys the reputation of being one of the best "dressers" of incurved chrysanthemums of his day. Mr. Molyneux's first charge was as head gardener at Burton Hill, Petworth, where he remained two years, when he went to Rookesbury Park, Wickham, now the residence of A. H. Lee, Esq., M.P. During the twenty-one years Mr. Molyneux has had charge of those gardens he has achieved much success as a cultivator, not only of chrysanthemums, but of fruit, and the many other objects that come under the gardener's care.

March Weather is proverbial for its unpleasant character, but we should have to go back several years to find a corresponding month so thoroughly unpleasant as that through which we have just passed. The sunshine was deficient, the temperature very low, and the rainfall considerably above the average. The total sunshine registered in London during the month was 51.5 hours, or 17 hours below the average. The mean temperature of the month was considerably below the average, and this was largely due to the low temperature that was experienced during the day. The highest temperature recorded was 59 degrees on the 29th, which was two degrees higher than in the corresponding month of last year; but in six of the past 38 years only has the maximum temperature of March been below 60 degrees.

Dry Rot of Potatoes.—In a paper by Miss Sibyl Longman, read before the Linnean Society, the author stated, as the result of her investigations, that the disease of the potato tuber, known as "dry-rot," due to the fungus Fusarium Solani, is not necessarily preceded by "wet-rot," but may be set up in sound tubers by inoculation with spores or mycelium of Fusarium Solani, which species is not a parasite of the resting tuber only; it may also attack and kill the shoots of potato plants. The fungus, which probably exists as a widely distributed saprophyte in the soil, infects the growing potato plant through the root; it also spreads from tuber to tuber during storage, and diseased tubers may produce diseased plants. Heat sterilisation of the resting potato tuber, with respect to Fusarium Solani, is impracticable, for a higher temperature is required to kill the fungus than to destroy the potato. A pycnidial stage occurs in the life-history of Fusarium Solani, which should therefore be placed in the Sphæropsidaceæ, and not, as is the case at present, in the Hyphomycetes.

Trees on Carlton House Terrace.—In reply to a question asked in the House of Commons whether it was proposed to cut down any trees on Carlton House Terrace other than those near the Duke of York's column which had fell, the Secretary to the Treasury stated that two poplar trees in the garden of the German Embassy and one in Lord Ridley's garden were felled by order of the Crown Estates Paving Commission, having been condemned as dangerous after consultation with an expert from the Office of Works. They were old and decayed and were unsafe to persons passing up or down the steps or along Carlton House Terrace outside the garden of the German Embassy. They are to be replaced by two plane trees, one on each side of the steps. There is no present intention of cutting down any further trees, such cutting taking place only when trees become dangerous.

American Gooseberry Mildew in Norfolk.—This destructive disease has been developed to so serious an extent in the Eaton district as to give rise to considerable anxiety, both to growers and the local authorities. It is reported that several acres of gooseberries are affected by the disease. Mr. Garnsey, the chief inspector of the Board of Agriculture, has made several visits to Norwich, and has been in consultation with Mr. J. Ward, the local inspector, who has traced one case to its source. A workman employed in the garden of a private owner, took some cuttings which he reared in his own garden. These developed mildew, and, on enquiry of the owner of the bushes, it was found that he had obtained them from Essex.

The Red Spider (Tetranychus bimaculatus), so well known as one of the most troublesome of the many pests that have to be contended with in the cultivation of plants under glass, is the subject of a bulletin issued by the United States Bureau of Entomology. According to the experiments conducted by Dr. Chittenden, the pest is better able to resist the effects of fumigation with tobacco and hydrocyanic gas than most other insects, but is readily destroyed by sulphur or soap solution.

Honour to Mr. J. S. Dickson. The other evening the committee of the Liverpool Auxiliary of the Gardeners' Royal Benevolent Institution entertained Mr. J. S. Dickson, of Messrs. Dickson, Chester, who is leaving Chester to enter upon a new nursery business in Oxford. Mr. C. A. Young presided, and, in proposing the health of Mr. Dickson, expressed the regret the members of the committee felt in losing so able and courteous a colleague, and testified to the splendid services he had rendered in connection with Liverpool Auxiliary, and said they all wished him every success in his new undertaking. Mr. Young at the conclusion of his remarks, presented Mr. Dickson with a token expressive of the high estimation in which he was held by those with whom he had been associated in the management of the local branch of the charity, which has done so much for gardeners no longer able to follow their vocation, and for their widows. Mr. Dickson suitably acknowledged the honour done him, and expressed his regret in parting from so many friends.

Reading University College Gardens.—Mr. F. G. Drew, head gardener to Ivor Guest, Esq., Ashby St. Ledgers, Rugby, has been appointed assistant director of horticulture at these gardens in succession to Mr. Charles Foster, who, as we announced some time since, has been appointed director of Lord Northcliffe's model farm at Guildford. Mr. Drew is well-known for his skill and administrative ability, and his training and experience have been such as to admirably fit him for his new sphere of activity.

Mr. J. Jacques, who had charge of the horticultural department of the Franco-British Exhibition last year, has been appointed head of the department this year.

Amaryllis at Chelsea.—The collection of amaryllis at Messrs. J. Veitch and Sons', Chelsea, are now coming rapidly into bloom, and may be expected to be at their best during the coming week. The high quality of the newer forms in the collection was indicated by the remarkably fine varieties exhibited by the firm at the Royal Horticultural Society's meeting on Tuesday last.

A Tea House for Hyde Park.—In response to the public demand that has been expressed from time to time during the past ten years, His Majesty's Office of Works has built a handsome tea house in Hyde Park. The building is located among some trees near the Serpentine, and in addition to the large room indoors, the wide verandah will afford accommodation for about two hundred persons.

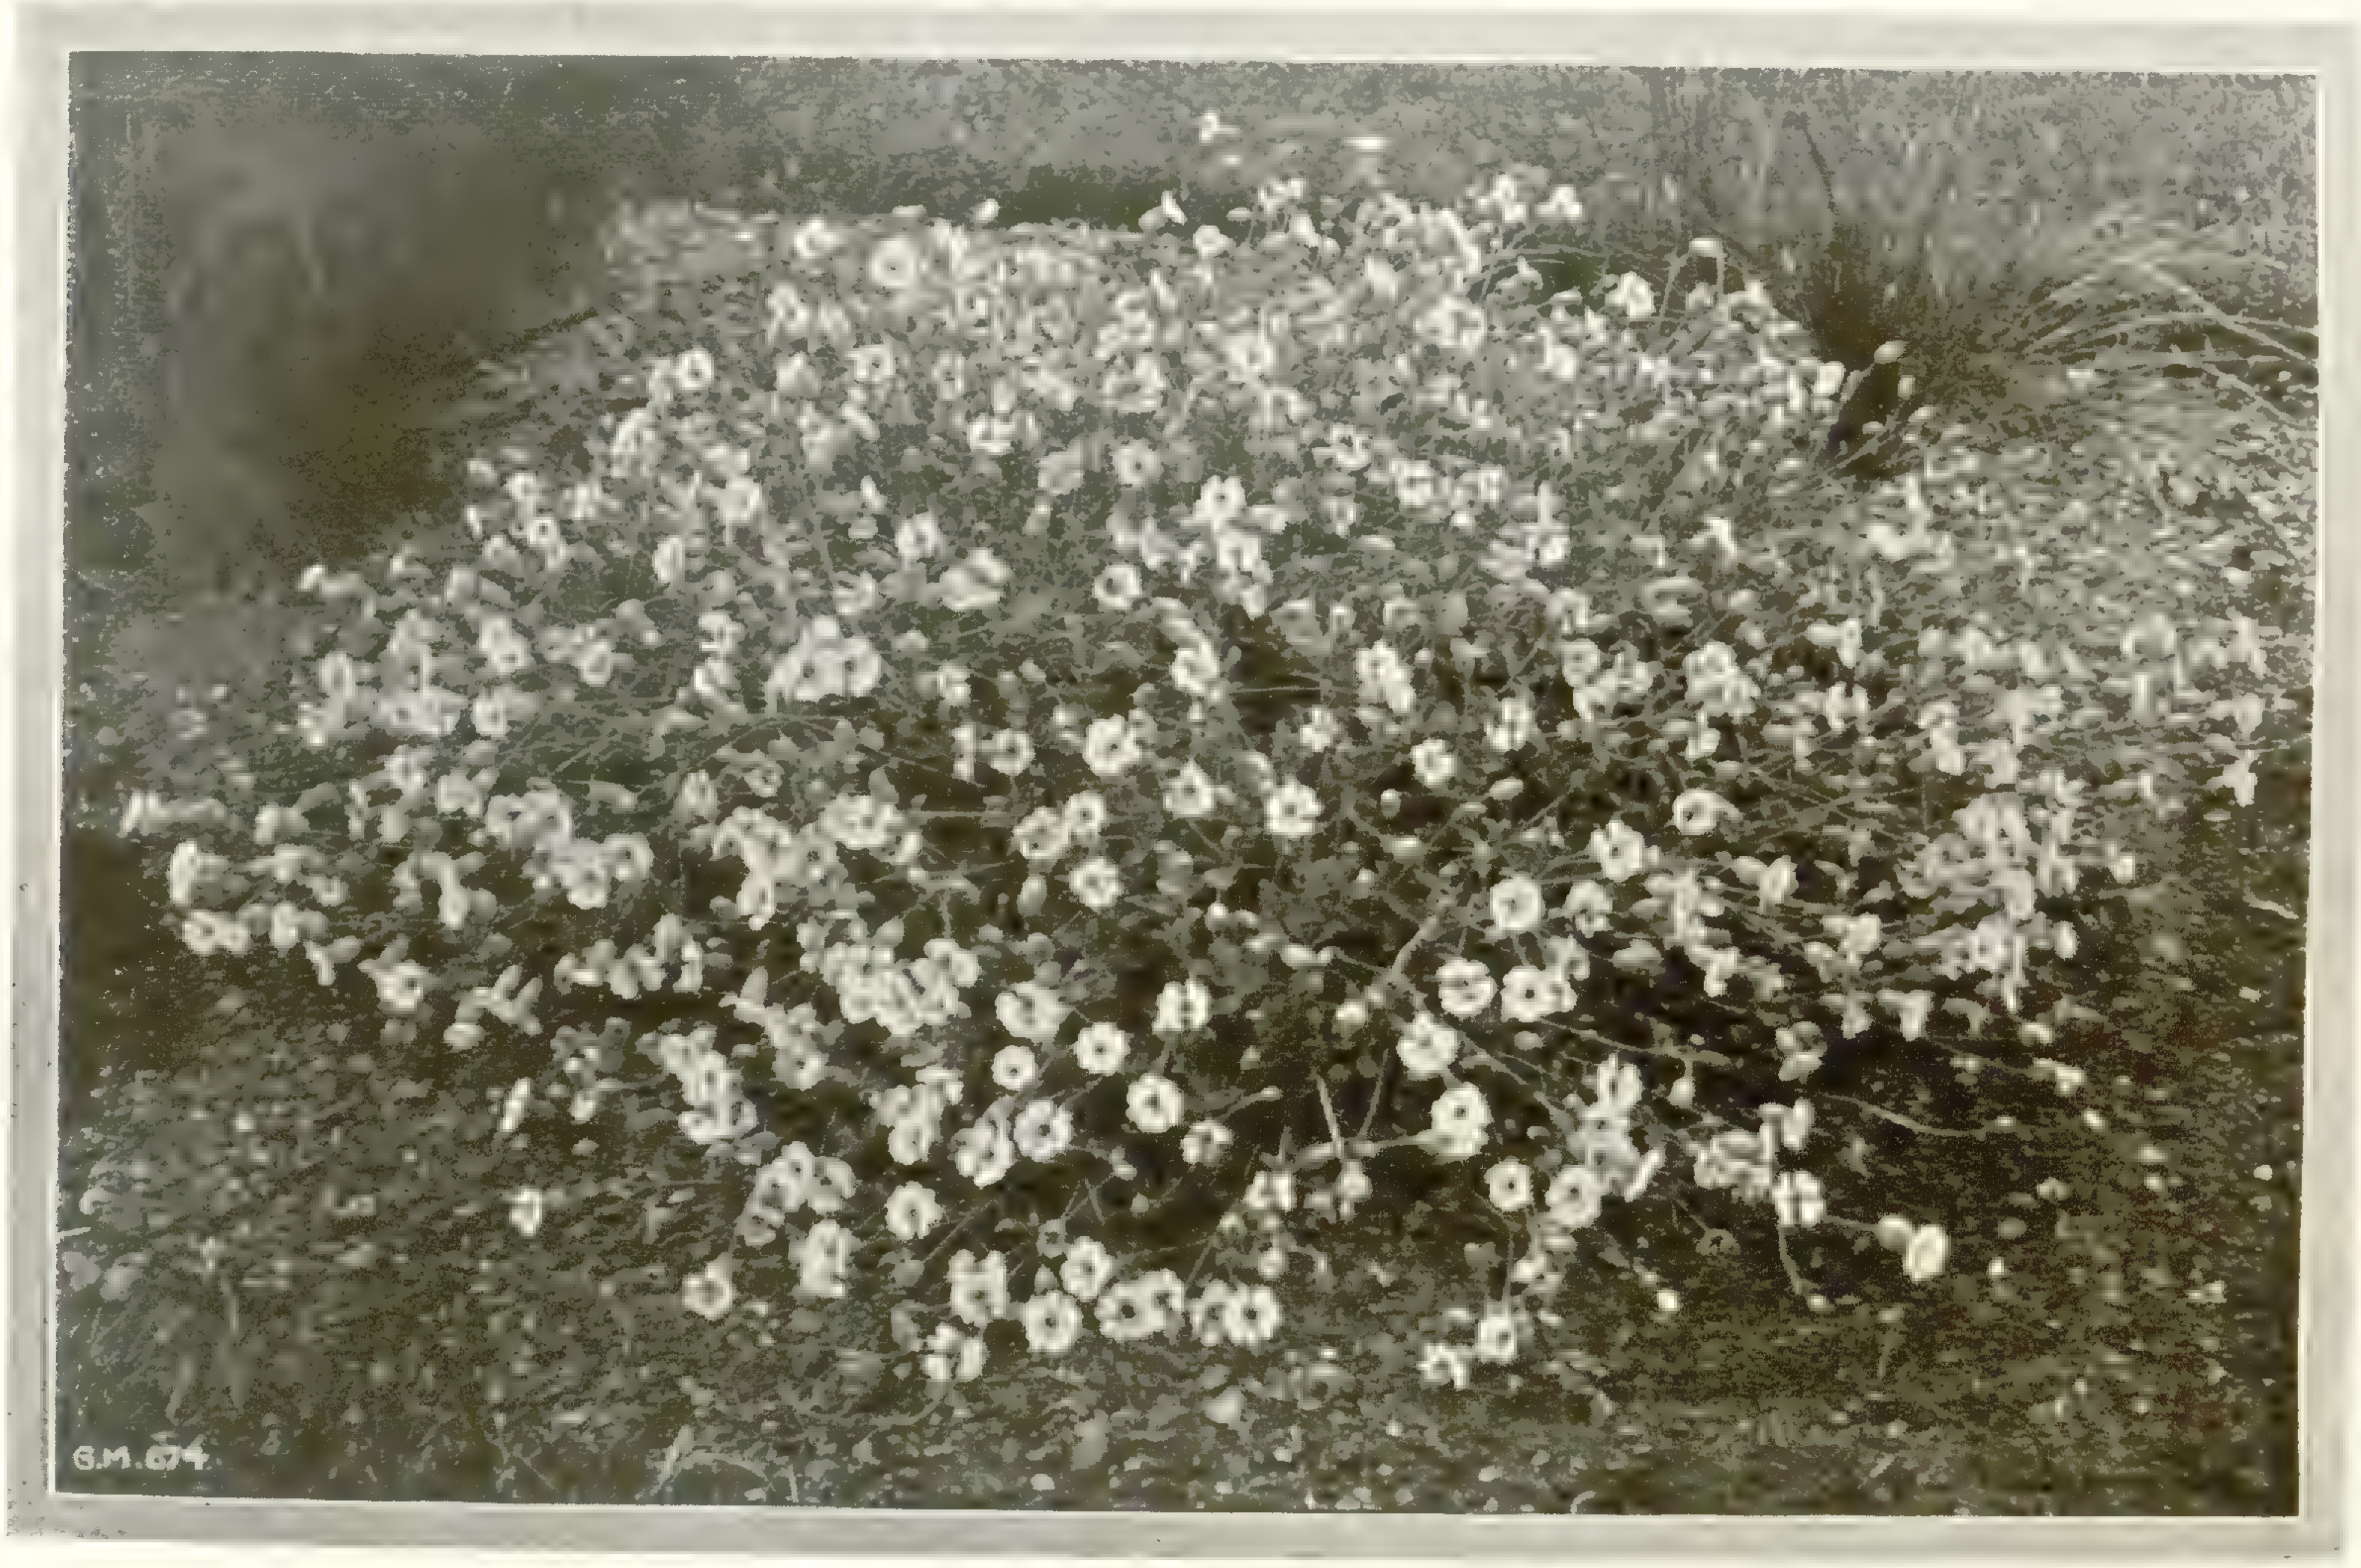
Reafforestation in Dorset.—A somewhat comprehensive scheme of tree planting was commenced during the past winter on Lord Shaftesbury's estate in Dorset. The trees have for the most part been planted on waste land which could not profitably be converted into a state suitable for tillage. The trees that have been planted comprise beech, elm, firs, and pines. Not only have new woodlands been created, but several belts, each [illegible] of five rows of trees, have been placed on the more exposed parts of the estate to afford shelter from the wind.

Mendelism.—A new work by Professor W. Bateson on "Mendel's Principles of Heredity" with illustrations, is announced for publication by the Cambridge University Press. A translation of Mendel's two papers on Hybridisation and H[illegible] appended, together with a biographical note. The author gives an account of the discoveries made by the application of Mendel's methods.

Influence of Forests on Climate.—With reference to this subject, which was recently discussed in these pages, "Nature" observes: The "National Geographic Magazine" for January continues its campaign against the destruction of the State forests of America by lessons drawn from two countries of the old continent. Mr. E. L. Harris, in his notes on the buried cities of Asia Minor, shows that in the neighbourhood of Pergamus the ruin has been so widespread that it is doubtful if any rational system of forestry can now restore the trees which once covered the higher grounds, and permitted a flourishing agriculture in that region. Mr. F. N. Meyer points out that in a large part of Northern China, which in the time of Marco Polo was the seat of extensive silk culture, the mulberry trees have disappeared, the rivers once used for carriage of goods have shrunk in volume, and the deserted wells bear witness to the shameful destruction of the forests. The denudation of the hillsides is said to have diminished the rainfall, the soil on the slopes has disappeared, and disastrous floods result from the rapid dissipation of the water in the rainy season. Here, too, the mischief seems to be almost past remedy, and unless the Chinese Government takes immediate and active measures the eastern extension of the Mongolian desert is inevitable.

Limousin Fruit Trade.—Mr. Vice-Consul de Luze gives in a report recently sent to the Foreign Office some interesting particulars of the cultivation of, and the trade in, fruit in the district of which Limousin is the centre. The fruit industry in this district is of interest to growers in England because a large proportion of the produce is sent to London. The principal valley in which the fruit is grown extends from the granite hills of Le Saillant to the Causses, passing by Brive and Beaulieu, and is about sixty miles in length. The whole of the area is planted with fruit trees, and presents the appearance of one vast orchard. There are also large areas under fruit from Limoges to Brive, by way of Objat, which are two of the most flourishing and important centres of fruit exportation. Plums are largely grown, and of Reine Claude (greengage) about 4,000 tons are annually gathered, the principal orchards being at Brive, Objat, and Les Quartres Routes. St. Anthony's and Royal plums are also largely grown. The variety known as the Red Bigarreau is the most prominent of the cherries, and of this upwards of 2,500 tons are annually exported to England from Brive and Objat. The soil of the district is a deep red fertile loam, and the peasants are described as strong, hard-working, and highly-skilled in fruit culture. Fruit reaches London in about thirty-six hours from the time of its despatch, and the cost of transit from Objat to London (464 miles), viâ Boulogne, is £6 5s. 5d. per ton for small lots, and £5 18s. 2d. for five ton lots.

A Mawdesley Willow Farm, as was briefly mentioned in a recent issue, is the subject of an interesting contribution to the "Kew Bulletin, by Mr. W. Dallimore. In the introductory remarks it is stated that for upwards of half a century the village of Mawdesley, which is situate in South-west Lancashire, has been famous for its willow beds and basket-making industry, and Mawdesley-grown rods have acquired a considerable reputation in the willow trade for strength and durability. Mawdesley differs from most willow-growing centres in possessing very little wet or marshy land, and willows are grown under similar conditions to such farm crops as potatoes, cabbages, corn, etc. It is to this comparatively dry method of culture that the special toughness of the rods grown in the district is attributed. According to Mr. Dallimore, the pioneer of willow culture in Mawdesley was the father of Mr. Cowley, who is the largest grower in the district, and his first venture was with a farm of eleven Cheshire acres (= about 23¼ English acres). As he had learnt from old growers that willow beds were only remunerative up to fourteen years of age, he obtained a lease for that period. His methods of culture, however, proved so effective, that at the time his lease ran out the beds were more productive than they had ever been, and he was glad to renew his lease at an increased annual rental of £30. For many years the business proved highly satisfactory, and more land was continually required, until he and his sons had about 500 acres under cultivation. Other farmers also planted largely when the trade was at its best, but of late years, owing principally to depression in trade and foreign competition, a considerable amount of land has been reclaimed for ordinary farm crops. According to Mr. Cowley, however, taking good and bad years together, willows pay at least as well as other farm crops. The methods of culture and the characteristics of the several willows grown at Mawdesley are fully dealt with, and the information should prove useful to those interested in the basket-making industry.



COMMON BLADDER CAMPION (SILENE MARITIMA), IN THE CAMBRIDGE BOTANIC GARDENS.
Flowers, white.

SILENE MARITIMA.

By some authorities this plant is considered to be a coastal form of our common "Bladder Campion," and like many of our native plants it is well worthy of cultivation, especially in light sandy soils. It is a perennial, and, if undisturbed, forms a compact clump a yard in diameter, yielding an abundance of its white flowers on stems about a foot high during the whole summer. There are two other forms of this plant, one with pink or rose-coloured flowers, and another with double white flowers. They are both desirable plants for the border, but the heads of the latter are rather heavy and require the support of some small twigs to show the flowers off to the best advantage.

E. J. Allard.

NITRO-BACTERINE AND MANURES.

A good deal has been said and written since last autumn about nitro-bacterine and the effects it has upon garden legumes when applied according to the directions which accompany each package. I have received cultures from Germany, America, and those prepared at home, and in the case of broad beans, sweet peas, and edible peas that were treated, no apparent difference could be detected from others growing in the same plots untreated. My legume crops are always grown upon ground well manured the previous year, and are usually noted for their general excellence. The soil is of a sandy character, overlying coarse red gravel, but the whole of the garden has received a dressing of chalk within the last five years, which, in every case was applied in the autumn and early in winter upon the surface, after digging or trenching, as the case might be. My observations leave me to think that nitro-bacterine, up to the present, is not virulent enough to give that decided hall-mark to crops that must necessarily be the case if the practical man is to be convinced of its virtues. To impress the commercial man the differences must not be so minute; if they may be detected at a glance by the use of these cultures, then their future is assured. Personally, I think it possible that further investigation will lead to more useful results.

I do not attach any importance in the case of stray information that is occasionally heard with regard to its value, and personally know of one case where it was tried in sterilised material, the seeds being well moistened with the bacteria solution, and the others, of course, were sown in the usual way. In the first case, the seeds germinated a week before those not so treated, and, although further applications were given in solution, eventually no difference was seen in the plants. It has occurred to me that in those cases in gardens where the plants have, upon treatment, germinated first, it has been solely due to the moistening of the seed coat. It is a well-known fact that such moistening is very helpful to tough-skinned legumes, more especially as the season advances.

In some cases, what would the advantages of earlier germination lead to? Possibly to deeper rooting, and deeper rooting during a dry season would be helpful, as growth would be more prolonged. Every cultivator knows the full value of a deeply-worked soil, and from practical experience in a cold, backward spring, knows the value of a sprinkling of nitrate of soda down either side of his pea rows. Why give it? Because it stimulates further root action, and the rootlets can absorb a greater quantity of the food in the soil. There must, however, be food in the soil, and I am firmly convinced that crops of legumes of any kind will never be grown in English gardens and fields unless the land contains organic remains in sufficient quantity to retain moisture. What good are chemical manures to growers if the soil is dry? They are so much waste; and, if organic manures cannot be obtained for maintaining the necessary soil texture well, we must organise some system of irrigation. Sure it is that we cannot allow the land in England to lie idle because motor and other traffic do not supply horse manure. So long however, as we people this earth, animal food we must have, and, while those immediately near large towns suffer, farms will continue to make this needful article for their own requirements.

We can imagine that some of the rich market gardens might well like a rest from the fifty up to two hundred loads of manure they are said to receive per acre. We know full well that fine crops are taken from land so treated, and know that such manurings serve more purposes than one. When all is said and done, the maximum crops grown are best reached by giving sufficient natural manures to maintain texture and friability, and by giving artificial soluble stimulants during the time rapid growth is being made. It is at this time that the food is best distributed over the plants's system to result in the largest possible crop afterwards. The art of giving manures, especially soluble stimulants, is not mastered in a day, but we are fully convinced that it is waste to apply more than can be made use of, and that the more immediately soluble the manure given may be, so much the more is it necessary to exercise care and judgment in its application.

When nitro-bacterine is more active to give that send-off to legumes in good soils that already contain the bacteria, then we shall see the improved results that we are at present waiting for; but if the living organisms placed by these cultures are not going to exercise their superiority when placed in soils already capable of producing good returns, we fail to see of what advantage they are likely to be. Poor soil is of no value to anyone, it costs as much to cultivate as rich, and takes as much or more good seed to sow it; therefore, no one in his senses would expect to obtain good returns from such soils unless the summer was a cold and wet one, when the moisture so necessary would make all the difference.

Although legumes are of value to succeeding crops owing to the nitrogen collected and stored by them, succeeding in the case of garden crops is different to field crops, which may not be sown until the following year. Take, for instance, a batch of early peas, sown late in February or early in March. The soil between the rows may be cropped with early potatoes, early cauliflowers, spring-sown spinach, early turnips, or other what are termed suitable catch crops may be had. When these crops are removed along with the peas, the latter not pulled, but cut just above the ground, it matters not whether the soil is dug or merely levelled over before being sown or planted with a crop for late summer or autumn use. It will be very noticeable all through, that the growth of the succeeding crops, whatever they may be, will be much inferior immediately where the pea lines were. When early peas are cleared off at the end of June or early in July, the soil more resembles the ashes taken from under a fire-grate, and, unless heavy rains occur or artificial watering is given, it is impossible for seedlings to germinate or plants to grow, so that it is necessary for some time to lapse before the nitrogen collected by these plants becomes available for crops which follow.

Frequently in gardens early peas are grown in the same positions every year, but, being cleared off early, the soil is not occupied again with peas until the following spring, and in the meantime has been moved by digging, which action always changes the position of the top portion. There is one outstanding feature about nitro-bacterine cultures, and it is that they have done no harm to the soil or plants upon which they have been tried. Caustic manures ought never to be sown with any seeds, and we cannot understand a good cultivator, who knows his business, applying them so that the young rootlets would immediately come in contact with them so soon as growth started. Lime or chalk has for ages been known to exercise a wonderful influence upon rich soils intended for legumes, just as their value is recognised when superphosphate of lime, ammonia sulphate, and potassic sulphate are applied. If soil is in good condition from the previous year and the organic manure applied at that time is now in a decomposed state of black mould, it will grow good peas or any other garden legumes and will produce shorter internodes than would be the case if lighter fresh materials were applied when sowing. I hope those testing these cultures this year will do so with the same number of seeds, under the same soil conditions, and if they moisten with the culture solutions and sow immediately, I trust they will moisten in the same proportion of pure water for other trials they propose testing with them. All the points connected with trials do not come to the surface at once, and what appears of small account is often of great value. It is best not to attempt too much, but select one variety and have two or three repeat trials of it; and do not select early peas for such trials to sow so late as May, but a type suited for producing a good maincrop. Test on various grades of soil if you wish, but, as before stated, starved deserts are not to be converted into fruitful lands, even by stimulants of an unseen nature. Plants, like animals, must have something solid as well as liquid; if they do not eat the soil it must be there to give up the food in soluble form for their nutrition, and the whole thing ends there, unless, as previously remarked, some system of irrigation for supplying moisture is resorted to. Moisture, moisture, and moisture is the legume's cry.

C. Foster.

TEA ROSE LADY ROBERTS.

One of the most charming of the more recently introduced roses is Lady Roberts, the beautiful reddish-apricot variety sent out by Messrs. Frank Cant and Co., of the Braiswick Nurseries, Colchester, in 1902. The flowers are exquisite in the bud state, indeed, few roses are as pretty, and still fewer are prettier. The form and colour are both so beautiful that the combination is delightful. The stems, too, are [illegible] without being coarse, consequently [illegible] table decoration, for bouquets, and personal adornment it is peculiarly well adapted, and, further, as the plants are very continuous bloomers, one may cut and come again. The colouring of this pretty tea-scented rose varies a little with the atmospheric conditions that prevail at the time the blooms form; in the heat of summer, under the influence of [illegible] sunshine and dry weather, the [illegible] is paler, and it is in early summer [illegible] during the whole autumn period [illegible] intensity of the deep apricot colour [illegible] the vividness of the orange tints [illegible] most pronounced. As an indoor [illegible] early blooming, Lady Roberts [illegible] become increasingly popular in [illegible] gardens, because of its beauty and [illegible]dom, and these early flowers, [illegible] glasses or in stands are very attractive. [illegible] word of caution is necessary in co[illegible] with this rose, and it is that though a vigorous grower, moderate or light pruning are better than hard pruning

HARDY FLOWERS are always popular. [illegible] make the garden bright and attractive, and [illegible] but little attention. All the information req[illegible] their successful culture is given in EASILY [illegible] HARDY PERENNIALS, by G. H. Vos. Price 5s. [illegible] post in box, 5s. 6d., from W. H. and L. ENGLEFIELD HOUSE WITH TERRACE GARDEN.

SOME GARDENS ROUND READING—I.

For a century or so Reading has been famous for its biscuits, and its garden and farm seeds; and for a long period it has been recognised as one of the most important of the many great gardening centres in England. Around it are a considerable number of gardens equally remarkable for their extent, their distinctive beauty, and for their high keeping, some being the property of great country families, while others have as their owners men who have achieved success in commerce or the professions, and take a keen interest in gardening and other aspects of country life. If the town enjoys fame, as it unquestionably does for two of the most important of its industrial enterprises, and for its horticultural associations, this is only in accordance with the fitness of things, as exemplified by its tradition. It would not be an easy matter to name a period anterior to that in which Reading occupied an important position in the annals of the country. If we turn back a thousand years, and this is not a short period, we shall find the town highly fortified, and the centre of a strenuous conflict between the Saxons and Danes, the latter eventually becoming the victors. Two hundred and fifty years later we find Henry I. founding a monastery for monks of the Benedictine order on a scale of exceptional magnificence, and endowing it with an ample revenue. This quickly obtained prominence, and continued to occupy a leading position among monastic establishments until their dissolution, when Henry VIII. converted the abbey into a palace. The core of some portions of the walls of the great hall still remain, and within these large numbers of horticultural exhibitions have been held that have amply testified to the remarkable skill with which all classes of ornamental plants and useful crops are cultivated in the district.

At a quite early period Reading became a place of commercial importance. In the reign of Edward II. the manufacture of woollen cloth was commenced, and carried on with more or less success for several centuries. Other industries have been introduced since the weaving of woollen cloth fell into decay—so far as Reading is concerned—but none, it would appear, attained to any considerable degree of importance until the foundation of the houses of Messrs. Huntley and Palmer, of biscuit fame, and Messrs. Sutton and Sons, who enjoy a world-wide reputation for their garden and farm seeds. The splendid work that has been accomplished by Messrs. Sutton and Sons during the past hundred years is well known to all who take an active interest in horticulture and agriculture, and therefore need not here be recapitulated.

Reading, it must be said to its credit, has taken a leading part in the development of educational work associated with farming and gardening. It was within the boundaries of the town that Lady Warwick established her hostel, and thereby gave an impetus to the training of women in gardening and agricultural pursuits. This hostel has been removed to Studley Castle, where, with the advantage of greater space, the work is continued; but Reading has in association with its University College a splendidly equipped school garden open to both male and female students, and here educational work of the highest value is being done. This garden, is in charge of Mr. Charles Foster the Assistant Director of Horticulture, and in the training of students science and practice is so happily combined that they are taught to regard science as of direct assistance to them in practical work, instead of being something apart from, and superior to, practice. Hence the success of the school, and the rapid progress made by students. The garden has also acquired considerable importance as a trial ground, more particularly in association with sweet peas, and this is largely due to the fact that Mr. Foster considers good cultivation essential in the making of comparative tests between new and old varieties. At all events, they are so grown that there is no difficulty in formulating an opinion as to the merits of novelties when compared with kinds in general cultivation.

Englefield House.

Long the home of one of the oldest of the great families intimately connected with the history of Berkshire, Englefield House, the residence of T. H. Benyon, Esq., is rich in historical associations, and of special interest to horticulturists from the fact that its gardens have from time immemorial occupied a foremost position among the leading establishments within some miles of Reading. The estate is situate between five and six miles to the west of the town, and is about one mile to the north-west of Theale. The village of Englefield is a model of what country villages should be, and, as one admires trim cottages nestling amid the trees, and their gardens aglow with flowers of the season, it is somewhat difficult to realise the fact that this peaceful spot has been the scene of more than one hard-fought fight, the most important being the battle between the Saxons under Ethelwulf and the Danes, in 871, which resulted in the victory of the former. The mansion occupies a prominent position on the higher ground in the large, finely timbered park, and commands views of surpassing beauty, and is approached by a drive that affords many a delightful peep of sylvan scenery. It may be interesting to note in passing that the church is within the park, and that, although the ancient edifice has been restored two or three times, it contains much of interest, notably, the fine tombs of some previous owners of the seat.

A FRAGRANT CORNER IN THE ENGLEFIELD HOUSE GARDENS.

The mansion, originally Tudor, stands at the eastern end of a terrace of so great a length and breadth that it might well be described as a broad plateau; and extending the whole length of the mansion and the terrace is a sharply rising slope, richly clothed with trees diversified in character and large in size. These form an excellent background, and afford an efficient shelter from the north and north-easterly winds, which greatly minimise the enjoyment of the garden when they are allowed to sweep across it without some check being imposed upon their force. The principal flower garden is that which gives so great a charm and interest to the terrace, and here is annually found a delightful display, in which tender and hardy plants are represented, and to which roses contribute their full share. As two illustrations of the terrace are given herewith, one including the mansion, there is no occasion for a lengthy description. It will be seen that the beds have been formed in the turf, and that the latter is intersected by gravel walks of sufficient breadth to give dignity to the design. There are bold groups of rhododendrons and other shrubs alongside the balustrade, and on the other side are masses of trees and shrubs that clothe the rising ground, and standing out boldly from among them is the handsome and spacious conservatory or winter garden. The groups of beds contiguous to the mansion are mostly embellished with ornamental-leaved and flowering plants that are more or less tender, and associated with them are bold groups of bamboos, which here grow vigorously, and appear to suffer less than usual from unfavourable climatic conditions. The scope of these notes will not permit of details being given, but it must be mentioned that the bedding arrangements reflect much taste and judgment.

Roses form a glorious feature of the terrace garden when the summer-flowering varieties are in full bloom, for there are numerous beds in which but one variety only is planted, and a still greater number of devices for the display of the charms of rambling and other roses of scandent habit to the best possible advantage. All the designs are admirably adapted to the use to which they are put, but one appeared to be well deserving of special mention, inasmuch as with its aid standard specimens, with finely developed heads, may be obtained with comparatively little trouble. This support consists of a stout rod some seven or eight feet high, provided with prongs at the base to firmly fix it into the ground, and surmounted with four or five curved rods, not unlike the ribs of an umbrella. With such a support as this dwarf plants can be utilised in the production of fountains of roses, which is perhaps a better term than weeping standards, and results of a most satisfactory character obtained. One of these supports, partly clothed with roses, is shown in the illustration of the part of the terrace devoted to roses, and the reader who is interested in the matter will do well to examine it.

On the slope at the western end of the terrace are some bold groups of golden-leaved shrubs, which produce a pleasing effect in contrast with the more sombre hue of the trees that form the background. In an open space, amid the trees that clothe the slope on the north side of the terrace, a water and alpine garden has been formed, and the progress made has been so satisfactory that at no distant date it will form a feature at once distinct and delightful. One might write at length on the manifold attractions of the handsome conservatory, but it must suffice to say that here, as elsewhere, the skill of Mr. James Coombes, the gardener, is evident, and that a very distinct and attractive effect has been obtained by planting out the richly coloured Streptosolen Jamesoni. A side border, extending about half the length of the structure, has been planted with this shrub, and the specimens are about five feet high, and as much through, and produce their brilliant orange-coloured flowers in great profusion throughout the summer months. Those whose experience with this shrub is limited to examples in pots will have but an inadequate idea of its capacity for flower production when the plants have a free root run, as in this case.

The plant and fruit houses are fully commensurate with the requirements of an establishment of the highest class, and it need hardly be said that Mr. Coombes utilises them to the fullest extent, as is the large area devoted to vegetables. Contiguous to the glass structures are two well-stocked herbaceous borders, and these are intersected by a broad walk spanned by one of the finest arches of Blush Rambler rose that has yet come under my notice. A glimpse is caught of the arch in the illustration entitled "A Fragrant Corner," but it is not there seen at its best, although it contributes its share to the delightful picture produced by the association of lavender, Madonna lilies, and roses, in which fragrance and pleasing colours are so happily combined.

Hillside.

Hillside, the residence of Leonard [illegible] Sutton, Esq., occupies a charming position on the high ground some distance to the south-east of Reading, and commands a wide prospect, including the town and richly diversified scenery that forms so admirable a setting to it. Those who are acquainted with the active interest Mr. Sutton takes in the many beautiful [illegible] of plants available for the embellishment of the garden will not need to be told that the gardens of Hillside are remarkable for their interest, their varied attractions, and high keeping.

Flowers are plentiful at Hillside, but the feature that commands more attention than any other is the fine breadth of lawn, that not only presents a pleasing contrast to the roses and other subjects that yield freely of their varied hues and fragrance but conveys a feeling of restfulness that one so greatly appreciates in the garden, and thereby affords an object lesson certainly not wanting in importance. The flower beds are proportionate in number to the area, and are so placed that they do not interfere with an uninterrupted view which constitutes so great a charm of a fine breadth of turf.

A short distance from the pleasure grounds, contiguous to the house, is a comparatively young orchard, and this is of much interest, apart from its value as the source of abundant supplies of fruits of high quality. Associated with the fruit trees are great breadths of the choice daffodils suitable for grass culture, and as these grow vigorously and flower freely the thousands of golden flowers produce a glorious effect that extends over a considerable period during the season of spring. Probably nowhere do daffodils, when grown in the grass, appear to greater advantage than when in association with apple trees, and, as exemplified in the Hillside orchard, there is no occasion to wait until the trees have grown old to obtain displays of bloom that will strongly appeal to those who are naturally endowed with artistic perceptions. On one side of the orchard was a broad border devoted to annual flowers, and this was of much value as evidence of the attractiveness of these flowers when the plants are arranged with due regard to the harmony of colour, and given sufficient space to attain to their full development of growth and flower production. On the way to the orchard note was made, and a photograph taken, of a tall standard of that well-known white rose Climbing Aimée Vibert. This specimen was of special interest from the fact that although it is one of the best of the white roses of pendent habit for tall standards, it is not a common occurrence to meet with one so grown.

CONSERVATORY AND ROSES, ENGLEFIELD HOUSE.

Arranged along the east side of the principal lawn are several plant houses, which are sufficiently ornate in design to contribute to the charm of the gardens, without being so elaborate as to interfere with the growth of the plants used in beautifying them. Here the judgment and skill of Mr. Townsend, the head gardener, appears to advantage. The importance of a frequent change in the plants used is fully recognised, and one would probably have to visit the gardens at rather short intervals to find precisely the same kinds of plants in any one of them on the occasion of a second visit. When these notes were made gesneras were in the ascendant, and the effect produced by the large array of splendidly flowered plants was so good that a photograph was taken of a group at one end, and it is herewith reproduced. This group deserves attention for the evidence it affords, not only of the success achieved in the production of the specimens, but of the great value of this section of the gesneras for the ornamentation of conservatory and greenhouse during the summer months. Their flowers may not be so rich in colouring as the flowers of the gloxinias and begonias, which may be had in bloom at the same season, but their flowers are attractively coloured, and lightly arranged on slender flower stems, and the velvety leaves are so rich in colour as to present a most pleasing contrast to the elegant flower spikes.

Foxhill.

Returning to Reading, and proceeding between one and two miles in the direction of Earley, which lays to the south-east of the town, Foxhill, the charming residence of Rufus D. Isaacs, Esq., M.P., is reached, and ample return for the walk is found in the beautiful gardens. Here the horticulturist, whatever may be the trend of his taste, finds much to stimulate his interest, and afford abundant pleasure; but there can be no question as to the gardens appealing the most strongly to the rosarian, who derives the greatest pleasure from his favourite flowers when he sees them displaying their charms in the garden.

Without the roses, which are grown in immense numbers, and with a high degree of success, the gardens of Foxhill would be found rich in attractions, and afford abundant evidence of the keen interest that is taken in gardening by Mr. and Mrs. Rufus Isaacs. With them the gardens are quite unique, not only among the many interesting gardens around Reading, but among those of the whole of England. With a full knowledge of the many gardens in which roses are largely grown and displayed with much taste, not one can be called to mind in which they constitute a more glorious feature than they do at Foxhill. The writer is not in a position to say whether Mrs. Rufus Isaacs takes a greater interest in roses than does Mr. Rufus Isaacs, but the high estimation in which that lady is held as a rosarian has been exemplified in a striking manner. The other day the Reading Rose Society held its annual meeting, and the members unanimously elected Mrs. Rufus Isaacs as its president for the current year. This meeting was of interest also in this connection for the proof that was given of the appreciation in the district of the great charms of the rose garden at Foxhill. The exhibitions of the society have hitherto been held in the town, and, notwithstanding the large and beautiful displays that have been produced, the general public have not participated in the feast of flowers so freely as might have been expected. Hence it was suggested that permission be sought to hold the exhibition in the Foxhill gardens, and, this having been obtained, the executive is looking forward to the financial results of this year's show being more satisfactory than for some years past. There can be little, if any, doubt that these anticipations will be fully realised, provided, of course, the weather conditions are favourable.

To convey anything approaching an adequate idea of the varied and beautiful effects that are annually produced by the roses with no aid other than that afforded by the pen would be extremely difficult, if not utterly impossible. The two illustrations herewith are of considerable value in the elucidation of the written description, but I should have preferred at least three times that number. Much perplexity would have been escaped by the use of the larger number, for it was not an easy task to select two from twelve photographs of as many distinct features, and all more or less beautiful.

The reader might well be asked to carefully examine the view of the arrangements to which the mansion forms so excellent a background. If this be done, it will be seen that roses are grown in well nigh every conceivable form, and with a degree of success that is beyond praise. It will not perhaps be so readily seen that the whole of the beds and borders, the groups and arches, and the single specimens, are arranged in accordance with a carefully prepared plan. But this is plainly evident in walking through the garden and enjoying the varied hues and the delightful fragrance of the thousands of blossoms that so freely display their charms, and the visitor can hardly fail to be impressed by the judgment evinced in the conception and execution of the design.

FINELY-GROWN GESNERAS AT HILLSIDE.

Within these delightful gardens there are beds and borders of roses, arches and trellises of roses, pillars and pergolas of roses, and there are roses in groups and roses grown as single specimens. Some of the latter would, in popular language, be described as "weeping" roses, but I confess to not having a liking for the term, however convenient it may be for descriptive purposes, for of all the blossoms entwined in Flora's garland I know of none so liberally endowed with the power of bringing delight to the mind and gladness to the heart as the rose in its many attributes of beauty. The tall standards, bearing aloft the most beautiful of the free-growing and graceful ramblers and Wichuraianas, are remarkably attractive, and contribute liberally to the general effect, and it would appear from the healthy state of their growth that due attention had been paid to the condition of the stems in making a selection, a point of some importance in the life of a tall standard rose. It was gratifying to see that while such beautiful varieties of recent introduction as Dorothy Perkins, Lady Gay, and Alberic Barbier are fully represented trained in elegant festoons, the best of the Ayrshires and other ramblers that were introduced in the early part of the last century have not been overlooked. The specimens of the Dundee Rambler in the central grouping in the rose garden are probably unsurpassed both in shapeliness and in flower production. There is a separate bed devoted to the newest of the Wichuraianas, and these, trained over logs of wood, produce a charming effect and one rich in interest.

The dwarfs and standards comprise hybrid perpetuals, hybrid teas, teas, noisettes, and other of the more important sections, and these are arranged in comparatively large beds in such manner as to produce bold masses of bloom. Some of the smaller beds are wholly devoted to one variety, but the larger beds contain two or more varieties, each of which is arranged in a group by itself. This is certainly much to be preferred to the practice adopted in many instances of distributing all the colours over the bed cially when, as in this case, it fo of a general plan. As a course, where several varieties planted in the same bed they were with due regard to habit, and harmony. In some of the beds have been associated with the roses in the central grouping of climbing and standard roses there is a cir of lavender, which, with its growth, quiet colouring, and frag contributes materially to the charms garden.

On the other side of the mansion is a pergola of considerable length. with larch poles and clothed wi and alongside it are numerous dwarf roses, and here, as in the garden, growth and bloom pro such as to surprise even those well acquainted with the results when cultural skill of a high brought to bear upon them.

If nothing is said of the fru tions, the vegetable quarters, and structures, it is not because they ing in interest. Mr. F. W. gardener, is not less successfu management of these than he is in tivation of roses, but it is not to do these features justice.

Whiteknights Park.

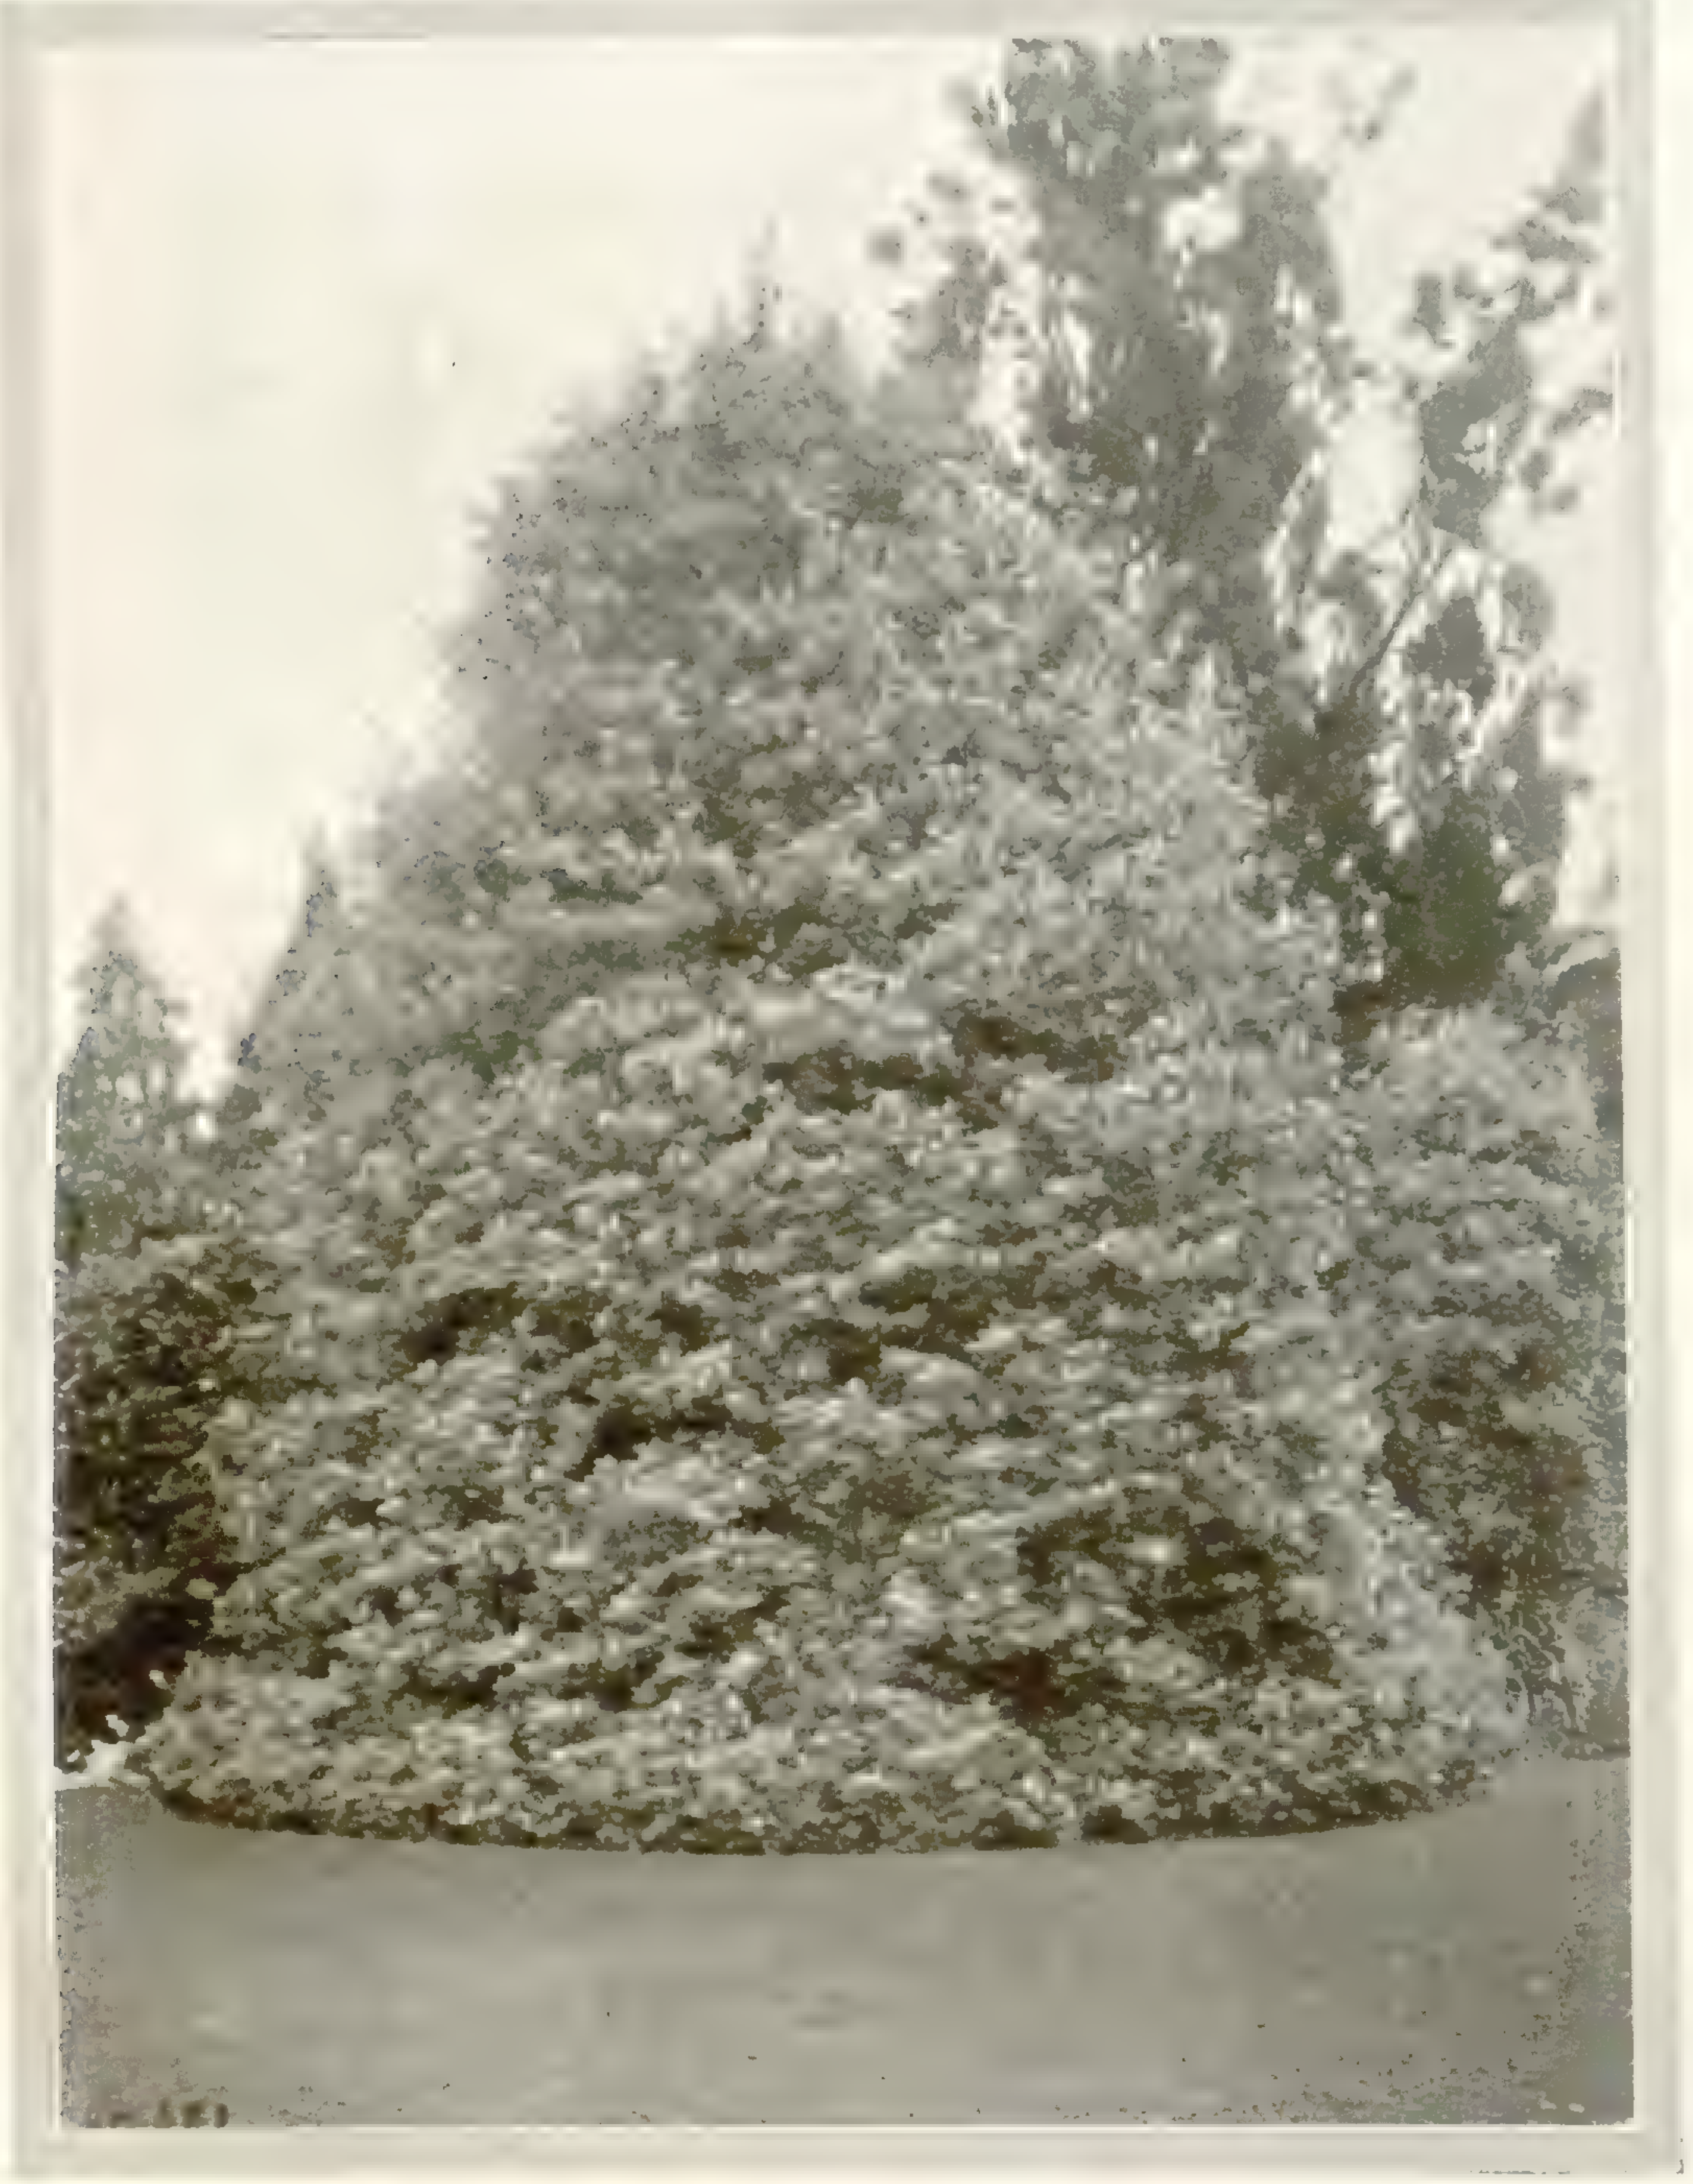
The gardens of Whiteknights Pa seat of Julius Friedlander, Esq., occupied an important position kindred establishments in the dis for upwards of a century they regarded with much interest for numbers of rare trees that have home within their boundaries. knights Park is situate a short the south-east of the town of and its gardens began to obtain towards the close of the eight

MANSION AND ROSE GARDEN, FOXHILL.

PERGOLA AND STANDARD ROSES, FOXHILL.

tury, and the interest they then evoked was maintained for thirty or forty years in the nineteenth century, when there was a change of ownership. They again became prominent, and this prominence has been well maintained until the present time, as the result of the great interest taken in his beautiful domain by Mr. Friedlander, and the skill of Mr. F. Bright, his gardener.

From about the middle of the eighteenth century to the end of the first quarter of the nineteenth, Whiteknights Park was in the possession of the third Duke of Marlborough and his son, the Marquis of Blandford, both of whom planted largely, and gave special attention to the choicest trees and shrubs that were then in commerce. The greater number of the latter were planted between the years 1790 and 1810, and possibly the greatest proportion of these were planted in 1804, when the bill of one firm alone for rare trees amounted to the goodly sum of £15,000. In those days from five to twenty guineas were considered ordinary prices to pay for nicely developed examples of rare kinds, and consequently the planting of these on a large scale was a very costly matter. At that time the Yulan (Magnolia conspicua) was regarded as a tender tree, and assigned a position in the conservatory, where it bloomed freely and ripened seeds. From these seeds plants were raised, and as these were the first seedlings obtained from home-saved seeds they created a considerable amount of interest.



SPECIMEN OF SILVER QUEEN HOLLY, WHITEKNIGHTS PARK.

In the clearings of the wood contiguous to the pleasure grounds the finest of the deciduous magnolias in commerce, and known to be hardy, such as M. glauca, M. macrophylla, and M. tripetala were planted in considerable numbers.

It is interesting to mention in this connection that among the many trees planted which were then rare were the variegated Turkey, Clethera paniculata, Laurus sassafras, Photina serrulata, Cratægus salicifolius, several fine forms of the American and European limes, Pavia macrostachya, the noble Ulmus effusa, and a range of forms of the Cockspur Thorn (Cratægus crus-galli). It would require much space to enumerate any considerable proportion of the specimen trees that now contribute so liberally to the attractions and interest of the gardens, and to give such particulars relating to them as would distinguish the list from a mere catalogue. Specially noteworthy are the specimens of the choicer oaks, and the Cedar of Lebanon, for, notwithstanding their great age, they are perfect in their proportions, or as nearly so as one could hope to see, and their wide-spreading branches sweep the ground.

On a wide stretch of lawn, that is bounded by a wall and a fine herbaceous border on one side, and a belt of trees and shrubs on the other, are numerous specimens quite exceptional in their development. Of one of these, a magnificent variegated holly, an illustration is given herewith. There are examples of other trees and shrubs not less noteworthy in their way, and some that interested the writer greatly were the clipped yews that are credited with a great age, and as having throughout their long lives sheltered a well whose history extends back to the year 1798. These interesting yews, which are supposed to be much older than the well, have been cut to resemble a square summer house, and doubtless form a cool retreat in the hot summer days. This old well, with its ancient yews occupies a position at one end of the enclosed lawn, and in association with it are numerous coniferous trees, notably species of thuia and cupressus. Here Mr. Bright, who is a past master in the art of fuchsia culture, groups numerous specimen fuchsias with singularly good effect, the quietly coloured flowers being admirably adapted to their surroundings. The specimens, which range from six to nine feet in height, have their pots plunged to about one-half their depth in the turf, and facility is thus afforded for giving proper attention to watering.

In the spacious kitchen garden also numerous splendidly grown fuchsias of immense size were met with, as were many other notable objects, the fine crops of vegetables being particularly noteworthy. Of special interest in this department is the comparatively large tree of Cox's Orange Pippin apple, which, if not the largest, is certainly one of the largest in the country. Its productiveness is equal to its size, and an orchard of some size formed with such trees as this would not fail to give a good return for both rent and labour.

Bere Court.

Pangbourne has long obtained recognition as one of the most picturesque villages on the Thames, and been the resort of the angler and the artist, and, indeed, of many who do not handle the rod or the brush, but can enjoy to the full beautiful scenery. Theretore, when it is stated that Bere Court, the residence of C. B. Tate, Esq., is situate within a short distance of this favoured village, and in one of the most beautiful spots in the neighbourhood thereof, it will be readily understood that its scenic advantages are great. From within a short period of the foundation of the monastery at Reading till its dissolution in the reign of Henry VIII., Bere Court, or "the fair manor place of brick," as Leland describes it, was the residence of the Abbots, the last of whom was Hugh Faringdon. The mansion has, of course, undergone considerable alterations since the last of the Reading Abbots resided under its roof, and it may be assumed that it has been greatly modernised. However this may be, the grand old house, standing at the head of a narrow valley, rich in arboreal features, presents a stately appearance amid its leafy surroundings.

The weather was especially unkind on the day in which Bere Court had a place in the programme, and it was far from pleasant to make a journey of five or six miles and then to be unable, owing to a continuous rain, to enjoy the pleasure the gardens and grounds are so well able to afford. It, however, was not difficult to see that the view down the valley was extremely beautiful, that the sides had been planted with much taste and judgment, and that Mr. E. Fry, the gardener, had provided an attractive display of hardy and other flowers, and that in other directions also he had displayed much skill. On the west side of the valley a large area is devoted to coniferous and other trees, all of which are in the most robust health, and include many noble specimens. The firs, the pines, and the cupressus were especially noteworthy, and prominent among the deciduous trees was a magnificent example of the cut-leaved beech. The tree is about fifty feet high, finely proportioned throughout, and the branches sweep the ground

This handsome beech has on several occasions been strongly recommended in these pages for planting in the pleasure grounds, and no better proof of the soundness of the advice could be desired than was thus afforded. Hence the regret that the climatic conditions were such as to render it practically impossible to obtain a photograph of this, and, indeed, of some other of the unique specimens.

George Gordon.

⁂ The second article on "Some Gardens Round Reading" will appear in our next issue.

OUTDOOR FIGS.

In some gardens figs grow freely and fruit abundantly, without more attention than the merest routine of pruning and gathering the fruit, while in other gardens the greatest difficulty is experienced in obtaining even a small crop. In the former case the soil is of a light, porous character, thus naturally warm; in the latter the soil is of an opposite nature, being heavy and retentive of moisture, and is cold in the spring, and therefore unfavourable to growth.

HERBACEOUS BORDER WITH ROSES, WHITEKNIGHTS PARK.

These are the principal reasons, briefly summarised, why success is obtained on the one hand, and failure on the other. In some gardens on the South Coast immense bushes may be seen growing in the open and carrying annually a heavy crop of extremely fine fruits. I need hardly say these are exceptional, and hardly to be equalled, except under very favourable conditions of site. The south or west aspect of walls is the proper place for the fig in the open, and there are many walls and gables of buildings that might be profitably occupied with fig trees. If such a wall happens to have a chimney passing through it, so much better for the fig trees, as warmth is a great factor to success. On suitable walls we often see fig trees growing in such an unsatisfactory manner that few fruits are produced, and these of a small size and poor in quality. The chief fault lies in the tree making too much growth, owing to the unlimited space allowed the roots. Where the soil is heavy, the roots are fibreless and ramble away no one knows where.

To ensure success in fig culture a full command of both root and branch is absolutely necessary, and, if the branches are not far enough apart for the shoots to become fully matured, a full crop of fruit is impossible.

As to varieties, two are quite sufficient—one might suffice, but variety is at times useful. Much the best is Brown Turkey, which is sometimes known as Osborne's, and Dwarf Prolific, and also Lee's Perpetual. The tree is prolific, the fruit is large and richly flavoured, and the skin is brownish red or tawny brown. Brunswick is of stronger growth, and well adapted for high walls, but its roots must be under control to induce it to fruit freely. The fruit is larger than that of Brown Turkey, the skin is tawny brown on the sunny side, the flesh is tinged with red, and of excellent flavour.

The question of soil is an important one. In a loose, deep rich soil, the roots are much too freely made, and this induces a strong growth that fails to mature. Calcareous loam intermixed with lime rubble, broken bricks, or flints, made quite firm, and resting on a fairly dry base is the best. Efficient drainage is essential to ensure maturity. A small border, 3ft. wide and 6ft. in length, will suffice for a tree several years if the supply of liquid stimulants is attended to when the fruit is swelling.

If the trees are taken from the open planting is best done as the leaves are turning yellow, but very often they are received in pots, then April is a good time to plant. Remove all the soil from the roots, and disentangle them, as they will be curled around the sides of the pot, spread them out quite straight, covering with a few inches of soil. Be careful to remove all suckers, and any buds below the soil line from which suckers would spring, as these are of no value and will become a nuisance as they increase. If the trees are, as they should be, on single stems, fan training is the best to adopt. Prune the trees tolerably hard back to induce base branches to push from the main stem if the tree requires further furnishing there. At no time should the branches be crowded. The bulk of the pruning is best done directly after the fruit is gathered in September or October, as the case may be. Remove all weakly growths, and those that have borne fruit, making room for the shoots for next season's crop, which is from wood of the previous season's formation. It is quite an exception to obtain a second crop of fruit from trees against open walls, except it be a particularly warm autumn.

If trees grow too freely, the result of an unlimited rooting space, they will not produce fruit, recourse must then be had to root pruning to check exuberance of growth. This is best done at the end of September, as the roots have then time to heal while the soil is warm.

It is wise to give some protection to fig trees upon walls in winter, especially after a wet summer. The most effective, and the easiest method of protection, is to place a layer of straight wheat straw 6in. thick, or bracken, over the branches, as they are closely fastened to the wall, and cover the straw with mats. This is a simple and effective method of protection; the main stem should be carefully covered, as well as the branches.

S. P.

FREESIAS.

Prominent among the bulbous plants that serve to embellish the conservatory are the freesias, of which F. refracta alba is a universal favourite. It is an exceedingly beautiful kind, whose exquisite pure white blossoms are delicately poised on slender stems. Charming as they are to the eye, there is no doubt that they owe a good deal of their popularity to their delicious fragrance. It is not the heavy overpowering smell of the hyacinth or some lilies, but just such a perfume as pleases even the most fastidious. A few pots of this freesia in a greenhouse will, in this respect, make their presence manifest throughout the entire structure.

One respect in which Freesia refracta alba differs from many other bulbous plants is that the bulbs can be readily grown, and depended upon to flower year after year, that is if a little ordinary care is taken in their cultivation. Full information as to their treatment has before now been given in the pages of the GARDENERS' MAGAZINE, therefore it will suffice to say that the main point is, after flowering, to assist growth by giving them a good position in the greenhouse, and to water occasionally with weak liquid manure. After this, when the resting period occurs, the pots of bulbs must be fully exposed to the sun. Then, towards the end of July or in August, the bulbs must be shaken clear of the old soil, graded according to size, and potted. In potting they may be grouped in any way that fancy dictates.

Notwithstanding the fact that freesias increase readily under cultivation, great numbers are imported into this country every summer. These are drawn from different sources, but the major portion of our supplies come from Italy, the South of France, and the Channel Islands. These imported bulbs are by no means all of equal merit, for among those sent as F. refracta alba flowers wanting in the purity of the best type often occur.

It was in 1881 that Freesia refracta alba was first brought forward, and, as might be expected, it quickly became popular. For many years this and the yellowish-tinted form, known as F. Leichtlini, were the only two kinds in general cultivation.

Within the last few years, however, visitors to the spring meetings of the Royal Horticultural Society have had many opportunities of seeing different hybrid freesias, some of which are undoubtedly destined to become favourites. Among the raisers is Mr. H. Chapman, and one of his raising, known as F. Chapmani, was, two years ago, given an Award of Merit. It is, I believe, of somewhat mixed parentage, viz., the product of a cross between F. refracta alba and F. aurea, crossed again with the first-named parent. The rich orange blotch in the interior of the flower is a very notable feature of F. Chapmani. F. aurea is, I believe, a quite old species, but only brought prominently forward within the last few years. It is dwarfer than F. refracta alba, while the flowers are of a rich orange-yellow colour. A decided drawback is that the blooms are quite scentless, but as F. Chapmani has only one-fourth of F. aurea in its composition it has not been much influenced in this respect. A second variety is F. alba citrina, and described as a seedling from F. refracta alba, similar to the latter, but with a shade of green in the flower, quite distinct, finely substantial, slightly campanulate blooms, most beautifully perfumed.

Another race of hybrids has been obtained, principally in Holland, from F. Armstrongi, which, sent from Humansdorp, Cape Colony, first flowered at Kew about ten years ago. This differs from F. refracta alba in its more slender, grass-like foliage, and the colour of its scentless flowers. Those of F. Armstrongi are of a lilac-pink tint, the tint being deeper towards the edges, while the lighter-coloured throat is tinged inside with yellow. The first hybrid of this section was F. Tubergeni. The parents of this are said to be F. Armstrongi and F. refracta alba. A second form from Holland was given an Award of Merit two years ago under the name of F. Tubergeni Amethyst. This shows a more pronounced leaning towards F. refracta alba than does F. Tubergeni itself. Quite recently we have had Rose Queen, a new member of this group.

Now that the different freesias have been thoroughly taken in hand, and their possibilities clearly demonstrated as in the case of so many other plants, some marked departures, with even an increased popularity, may in time occur.

W. T.

FACTS ABOUT GARDENIAS.

The interesting article by Mr. G. Garner, in your issue for February 27, recalls some incidents in support of his experience. It is true, as Mr. Garner says, that the successful growth of these shrubs requires that "new shoots must be produced each year, duly matured, and buds formed." To bring about these desirable ends is what every grower strives to do, but not always with the fullest satisfaction, yet there are instances on record where the finest possible results follow the simplest rules of procedure.

One such case that occurs to the mind at the moment, where a deep pit was devoted to a fairly large collection of specimen plants in pots. These had produced during the flowering season myriads of fragrant blooms at a tithe of the labour and anxiety many gardeners spend on them. Beyond the daily attention to watering, practically no labour was expended on them. The lights were never opened for the direct purpose of admitting air, not even in the most tropical of summer weather, and no shade was afforded the whole summer through, yet there was the deepest of green foliage and the purest of white flowers given in plenty, even with this scant attention. Needless to say, water was given copiously, for the pots were full of thirsty roots, but they gained some assistance from being plunged in a leaf-bed—one not often renewed. It would seem, judging both from observation and experience, that the gardenia does best when the structure, whether it be house or pit, is given up entirely to them. It is quite easy to recall instances where all the commonly practised methods of culture are present, the requisite heat, apparently suitable structure and soil provided, and yet there is the sickly-hued productions which the otherwise ambitious gardener would like to burn in order to be relieved of the unsatisfactory endeavour.

The plants already referred to were specimens, perhaps, 7ft to 8ft. high, with proportional breadth of leafy branches, and, as already stated, they gave blooms almost without limit. Quite as much success has been gained by others under methods quite different from this one. At Longford Castle, Salisbury, some years ago it was my privilege to inspect a large, healthy collection of plants then under the charge of Mr. Hazelton, now of Knowsley, occupying sunk pits, and grown fresh from [illegible] each year. They were treated in pots, [illegible] the size which they attained to in [illegible] was really remarkable, and we may [illegible] that flowers were produced in that [illegible]sive abundance which every grower [illegible] for, but does not always obtain. [illegible] Hazelton, we believe, plunged his plants [illegible] tree leaves, and plenty of heat was [illegible] their service from hot-water pipes. By [illegible] system of successive propagation, we [illegible] we are right in saying that blooms for [illegible]ton-hole purposes were available at [illegible] times of the year. The gardenia was [illegible] special favourite coat flower of the [illegible] Earl of Radnor, and naturally his gardener's desire was to supply this daily [illegible] over the greatest possible length of season. More recently I saw gardenias occupying stoves in which were mixed collections of plants, and, though the gardener in charge and the gardens themselves were reputed for high-class culture, the gardenias [illegible]guished, while their co-partners revelled [illegible] the apparently ideal surroundings. They had the sickly caste of leaf which is familiar to many cultivators, and [illegible] reflections which one would rather forget. The question that arises in the minds of the reader and reviewer is "Why should these things be?" The effort in [illegible] is made subservient to the demands of the subject as far as local conditions provide, and yet the issues are so adverse. It would seem to the careful observer that gardenias demand monopoly, and appreciate only their own society.

Rood Ashton Gardens.

MECONOPSIS HETEROPHYLLA.

Notwithstanding the frailty which is characteristic of the Meconopsis family, almost without exception, there runs concurrently with this weakness a singular beauty of leaf and flower that invests each with an individuality of its own, and always commands our admiration. Although we may never be able to claim unqualified success in the cultivation of even the commonest species, yet the genera will always be looked upon as one of the noblest and [illegible] among hardy plants, and worthy of the cultivator's time and skill.

One of the easiest to grow is the American species, M. heterophylla. It is a brave little annual, carrying well-poised, maroon-blotched orange flowers on slender, wiry stems. It forms a small bush some 15in. in height, and each lateral branch terminates in a flower. It is less leafy in its parts than M. cambrica, yet in a [illegible] way the flowers somewhat resemble that species, although in the substance of the petals and lasting qualities of the flowers M. heterophylla is superior to the Welsh plant. It makes good specimens if grown in an unheated frame in pots, and by this system we are able more fully to appreciate the rich colour of the flowers, which are remarkable for their size and the slender, fairy-like stems upon which they are supported.

M. heterophylla is readily raised from seed sown in pots during March or in the open ground during April, the soil should be rendered light and porous by the addition of sand, particularly so when grown in pots. It flowers during July and August. It [illegible] ripening seed in great abundance. It succeeds in positions fully exposed to sun, but some shelter from wind is advisable, as the plants are exceedingly brittle at the ground line.

THOMAS SMITH.

Walmsgate Gardens, Louth.

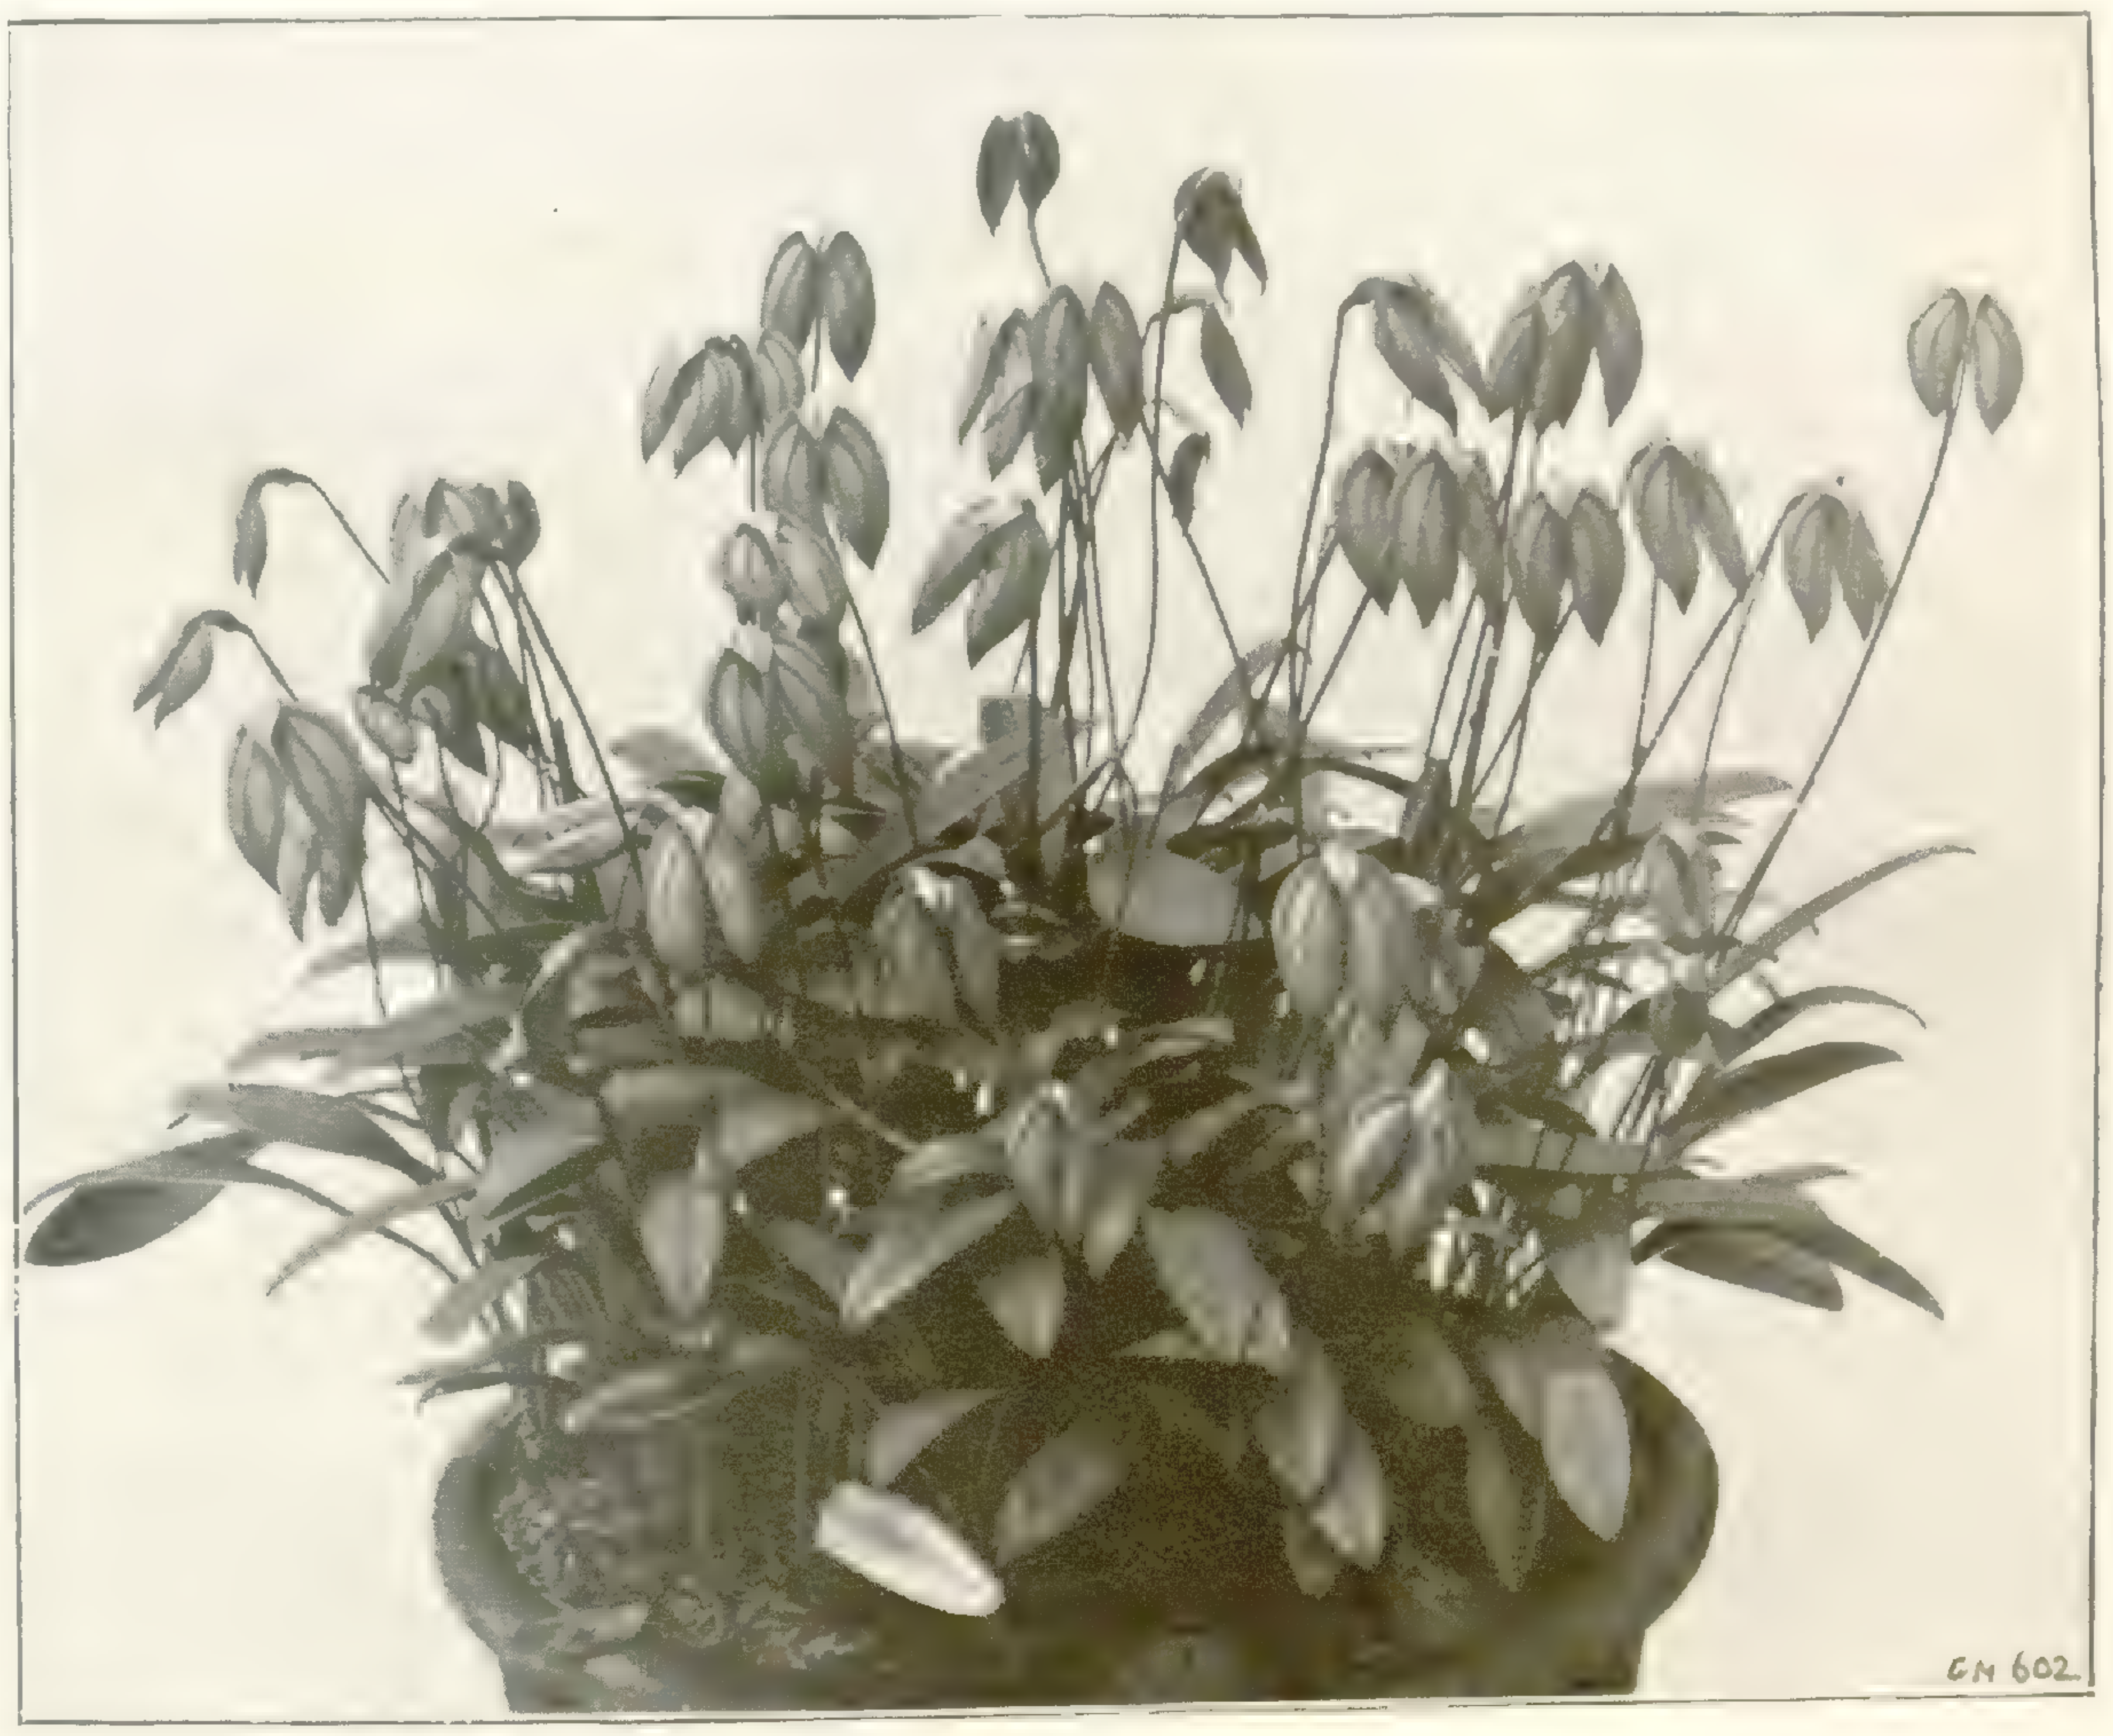
MASDEVALLIAS.

The illustration that is given herewith of the finely-flowered specimen of Masdevallia ignea testifies in no uncertain manner to the skill of Mr. H. J. Chapman in the cultivation of these as of other orchids, and suggests that the masdevallias might with advantage have their culture considerably extended. There may not be the same speculative interest in growing the several species or their distinct forms as in watching the flowering of imported plants of certain of the odontoglossums, or in anticipating the production of flowers by home-raised seedlings from crosses that have the promise of yielding quite exceptional results. Yet there is much that is of interest associated with them, and a considerable number bear flowers that at once attract attention by reason of their elegance and effective colouring. The cultivation of the finer of the masdevallias ought not, as is so frequently the case, to be confined to gardens wherein orchids constitute a strong feature, but should have a place in gardens generally, where the provisions for their successful cultivation can be made. They are all of moderate growth, and a lean-to house of quite limited dimensions would suffice for the accommodation of a collection sufficiently representative to give a large amount of pleasure to those who are able to appreciate quaint form and colouring, as well as to admire elegance of form and attractive colours.

Many amateurs who have the necessary time at their disposal, or whose gardens are under the charge of a practical cultivator, would derive much pleasure from a collection comprising the greater proportion of the forms in cultivation. But in gardens where decorative effect has to be given full consideration, in adding to collections, the growth of a few of the most beautiful kinds will be preferable. M. ignea, herewith illustrated, should be one of the first to be selected, and to indicate its charm and effectiveness it will suffice to say that the flowers are brilliant cinnabar-red tinted crimson. M. coccinea is not less desirable, and of its numerous forms, that known as Harryana is the best. This beautiful variety differs materially in colour, and all the shades are more or less attractive, but the rich crimson-purple hues are the most effective. Of exceptional excellence also is the brilliant orange-scarlet M. Veitchiana, which has relatively large flowers, borne on long, slender scapes. M. rosea is a beautiful species, with medium-sized flowers of a rich carmine-rose hue. These and their varieties form a small but fine group, and to them might be added such attractive hybrids as M. Chelsoni, M. Elli[illegible] and M. Gairiana. M. tovarensis is a dwarf-growing species, perfectly distinct from the foregoing, and bearing pure white flowers that range from three to five on a scape. This requires rather more warmth than the other species, and should have a place at the coolest end of the cattleya house during the winter months, and a position near the glass.

Usually growing at high altitudes, the masdevallias require under cultivation a moderate temperature throughout the year, with an abundance of atmospheric moisture. Speaking in general terms, the day temperature should be about 55 degrees during the autumn and winter months, and [illegible] degrees in spring and summer, [illegible] each period, a night temperature [illegible] degrees lower. It will not be possible to maintain so low a temperature as [illegible] degrees during hot weather in summer, but much may be accomplished in that direction by judicious ventilation, shading, and pouring water freely about the paths, walls, and stages, at rather frequent intervals. The damping down of the stages, floor, etc., for the maintenance of a liberal degree of humidity will be necessary throughout the year, but the frequency will be determined by the conditions that obtain outside. Careful attention must be paid to the watering of the plants; the supplies should be liberal than otherwise, but they must be adapted to the season and the individual requirements of the plants.

Fibrous loam and sphagnum moss, in equal proportions, make an excellent potting mixture, and the end of January is as good a time as any for repotting and surfacing the plants. It is not advisable to have a large mass of material about the roots, and the practice adopted of filling the pots to about two-thirds of their depth with clean crocks and the remaining space with the potting mixture is a good one. In repotting the base of the plant should be level with the rim of the pot, and the material be pressed rather firm G.



MASDEVALLIA IGNEA.
A finely-developed specimen of this brilliant scarlet-flowered species in Mr. Norman Cookson's Collection.

Viola Rydbergi.—The American violets are by no means too widely cultivated, and their merits ought to be brought into greater prominence than they have hitherto been. Some have been in cultivation for a considerable time, but others are of recent date in our gardens, especially those from Colorado and the Rockies in general. To these belongs the subject of the present note, Viola Rydbergi, which is of somewhat bolder and more vigorous habit of growth than the majority of the violets now in our gardens. I see that its height is given in some catalogues as four, and in others as six inches. Whatever it may be in pots, and I have not grown any in this way, on the rockery it is certainly taller than either of these heights, and I have had plants from nine inches to a foot high. It makes a good-sized, bushy plant, liberally supplied with a number of large white flowers, which are tinged slightly with purple. These flowers are of the characteristic shape of the violet family, and are, combined with the plant itself, highly ornamental, although not showy. This violet is quite hardy with me, and so far as one can ascertain, is so throughout the United Kingdom.—S. Arnott.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CALANTHES.—The deciduous calanthes will now be commencing their new growths, and as the young roots make their appearance, the plants should be attended to for repotting purposes. Where the plants have been turned out of their pots, and have been laying close together in boxes, some care is necessary in moving them, to avoid damaging the growth or injury to the new roots which may have run into the moss on which they have been standing. In dealing with these preserve as much of the moss about the roots as possible, as this will to some extent protect them in the process of repotting. Where the plants have been standing in the pots during the resting season they should be given a thorough watering a few hours before, or the day previously, to their being repotted. This will soften the old compost, and reduce the risk of damaging the new roots. Cut the old roots off to within an inch or two of the base of the bulb, and remove the old pseudo-bulb before repotting. Careful examination of the pseudo-bulbs for scale or other insect pests should also be made, for if the plants are carefully cleaned at this period, much trouble will be avoided afterwards. Five or six-inch pots, according to the size of the pseudo-bulbs, are large enough when the plants are grown singly, and they should be well and carefully drained. Where it is desirable to grow several plants together in each pot, suitable sizes should be selected, according to the varieties and the relative strength of the pseudo-bulbs.

SUITABLE POTTING COMPOSTS.—There can be no doubt that the selection of suitable potting compost is a great factor in the successful cultivation of calanthes. I have had some varied and very distinct experiences in the cultivation of calanthes in different parts of the country, and have come to the conclusion that it is desirable to ascertain by experience the exact treatment and potting composts suitable for the plants under the particular conditions and situation in which they have to be grown. It is generally considered that good turfy loam, fibrous peat, and chopped sphagnum, with perhaps a little dried cow manure intermixed, and sufficient sand or broken crocks added to keep the compost porous is the most suitable. There can be no question but that turfy loam is a most suitable medium under certain conditions, but there are numbers of districts in which the inclusion of loam is detrimental to successful cultivation, and a compost of chopped sphagnum, fibrous peat, or osmunda fibre, or a mixture of osmunda and peat, is by far preferable. Especially is this the case when the hybrids of weak constitution are dealt with. I would advise those who have been at all troubled with the disfiguring black spots on the foliage, pseudo-bulbs, and flower spikes, to discontinue the use of loam.

CALANTHE HYBRIDS AND VARIETIES.—There have been considerable additions to the hybrids and varieties, and some most remarkable coloured forms have recently appeared among the hybrids. C. W. Murray, C. Bryan, C. Harrisi, C. Gildeni, C. Victoria Regina, C. Clive, C. Oakwood Ruby, C. Chapmani, C. Norman, C. Angela, and many others, when they come to be better known, will be found of much value in gardens where calanthes are extensively grown. Some of them are only to be found in limited numbers, but the majority of those mentioned are in general commerce; all are worthy of consideration where these plants are appreciated.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY. — With the warm weather the climbing and other plants in the conservatory will be making rapid growth, and tying and training must be regularly attended to. Where camellias are planted out in beds, whether used as a covering to walls or not, they may, if necessary, be now pruned back, as most of them will be out of flower. If this is done at once it will not at all detract from their flowering next season, as fairly strong young growths, well ripened, produce by far the best flowers. If the structure is shaded by means of blinds it will be as well to have these fixed at once, although there may be no danger from burning by the sun's rays. Yet, if they are let down for an hour or two in the middle of the day the flowering period of various classes of plants will be prolonged; where blinds are not used a very good mixture for shading may be made up with starch and whiting, to which may be added a little green; this mixture, if carefully applied when freshly made, will have a pleasing appearance, and last the whole season. I prefer this to any other shading wash, as it comes off quite easy in the autumn, and does not injure the paint.

GREENHOUSES.—The above remarks as to blinds and shading also applies to the greenhouses, although, in the latter case, they may be more necessary. All newly-potted plants are the better for a little shade for a few days after potting. Begonias, calceolarias, and other soft-leaved plants, will also benefit by moderate shade during the middle of the day, as will also all plants that are in bloom.

CARNATIONS.—Young plants of winter-blooming varieties, whether struck late in the autumn or early in the spring, and kept steadily growing, should now be shifted into 3½in. pots, using a nice light compost for potting. With some loams it is not necessary to add nearly so much leaf-soil as to others, but it is better to err in too little than too much. Pot fairly firm, and transfer the young plants to a nice light house or heated pit, and maintain a steady temperature of about 50 degrees. Do not overwater, but on all fine days give a good syringing with well-diluted soot water.

MALMAISON CARNATIONS. — These should now have stakes put to them, so that the flower stems and young shoots may be tied as they increase in development. If the pots are full of roots a little weak soot water or liquid manure will help them, to be followed a little later with a dressing or two of some other good carnation manure. Give the plants all the light and air possible, with an occasional good syringing overhead, but if the plants are troubled much with rust this must not be overdone. An occasional dip or syringe with a suitable fungicide will help to keep the disease under.

GENERAL REMARKS.—As a good many of the bedding plants will now be drafted into unheated frames the houses will be less fully furnished. All the stages and the woodwork generally should be thoroughly cleaned, and the permanent occupants of the houses be given more room. At the same time, giving such plants as require it a slight surfacing over, and, in many cases, a sprinkling of some good fertiliser will help the plants. As far as possible keep the freshly potted plants together, so that they may receive the necessary attention as to syringing and shading. Keep the growth of such plants as ivy-leaved pelargoniums regularly tied in, pinching all the strongest shoots to ensure an evenly-balanced specimen. —THOMAS STEVENSON, Woburn Place Gardens, Addlestone.

THE FLOWER GARDEN.

GLADIOLI.—These extremely effective subjects are well fitted for planting largely both in beds and borders separately; also for planting in large masses in the shrubberies and herbaceous borders. Few summer flowers are more effective than a large, bold mass of G. Brenchleyensis when suitably associated with other flowering and foliage plants. Allow a distance of from twelve to fifteen inches between the corms. The ground should have been deeply worked and the corms planted to the depth of from three to four inches. On very stiff soils it is well to add some light material, and a liberal amount of powdered charcoal at the same time.

MONTBRETIAS.—Owing to the improved forms that have been lately introduced, these are enjoying, and rightly so, a large share of popularity. Beautiful shades of colour and graceful forms render them most useful both in mixed borders and for the supply of cut flowers for the decoration of rooms. Only in a few favoured localities is it safe to risk them in the open ground during the winter months, and, like many other things, the most beautiful varieties are the most tender. They should be lifted in the autumn and wintered in cold frames in boxes. The best time for planting these out is from the beginning to the middle of the present month; and, although beds may be devoted to them, they are very effective when arranged in groups in the herbaceous border. After planting, strew the surface with finely sifted cinder ashes.

SEED SOWING.—This may now be largely practised in the open ground. Among the annuals that may be sown include: Godetias, tropæolums, mignonette, larkspurs, love-lies-bleeding, annual chrysanthemums, candytuft, sweet sultan, poppies of sorts, etc. Attend to the pricking off of all annuals raised in heat, as this should be done when they are quite young. A cold frame with a bed of soil near to the glass is an ideal place for them. Sow now under glass nicotiana of sorts, cosmos, sunflowers, Chilian beet, commelina, etc.

SWEET PEAS.—Plants that were raised in pots and have been properly hardened off, ought now to be planted on well prepared ground, either in rows or clumps. To grow these successfully, plenty of room must be allowed them, and two years ought at least to elapse before growing them again in the same site. Care must be taken to protect them against birds and slugs, either of which, if allowed to attack them, will do much damage. Staking should be carried out at the same time as planting, and where sparrows are much in evidence, nothing is better than garden netting to prevent their ravages, and plenty of finely sifted cinder ashes should be placed round the young plants to ward off slugs.

EVERGREENS.—The majority of evergreens will move much better now than at any other season of the year, providing they are carefully moved and well looked after, and it will be quite safe to move all kinds of hollies any time during the present month. These should be well mulched and thoroughly syringed during dry weather.—E. BECKETT, Aldenham House Gardens.

HARDY FRUITS.

FRUIT QUARTERS.—The work pertaining to planting, pruning, spraying, etc., being now finished, an opportunity is given for manuring and digging the fruit borders. This work must not be carried out in a haphazard fashion, or more harm than good to the trees may be done. Trees which are growing moderately, and are in a fruitful condition by being well furnished with fruit buds, will be benefited by a dressing over the surface, as far as the roots extend, of some well-decomposed farmyard manure. This may be lightly pointed in with a garden fork, at the same time being careful not to disturb or damage the young roots near the surface. Trees which are growing strongly, and that make growths suitable for flower stakes instead of fruit spurs, should on no account have any manurial matter placed within reach of their roots. For currants and gooseberries, whose roots are usually near the surface, the manure may be left as a mulching, and not dug in, as the fertilising properties will be carried down to the roots by rain. Raspberries, blackberries and loganberries are other fruits to which it is better to apply the manure to the surface than to dig it in. The intervening spaces between the trees may be broken up by the spade more deeply. Finish off the work as neatly as possible, as the fruit quarters during the next few months will come more under observation than is the case during the winter season.

OLD STRAWBERRY BEDS.—Remove all the dead leaves from the crowns, and well dust around and among the latter some lime and soot in equal proportions, for the destruction of slugs and other insects. Be careful that as little as possible of the dressing be thrown on the young foliage. If the space between the plants were dressed with some manure during the past autumn what remains now may be lightly forked in. Newly-planted beds should be kept free from weeds, and the surface soil well open by the frequent use of the Dutch hoe.

PROTECTION.—The general outlook up to date is very promising for an abundance of fruit of all kinds, but nothing should be neglected in the protection of the blossoms should any necessity arise. All materials that can be utilised for this purpose should be kept ready at hand, and used on every occasion when frost is imminent.

VINES. — It would certainly not be wise to advocate the planting of these out of doors with the idea of their producing fruit fit for use, as excepting on very rare occasions, when we experience a summer of unusual length, and when the temperature has been above the normal do we see this. But there are a few odd wall spaces in most gardens on which a vine might well be trained, and which would amply repay the labour bestowed on it, and the space occupied, by furnishing leaves throughout the summer and autumn for use either for packing or for dishing up dessert fruits. Such leaves, when gathered from vines grown in the open, are of firmer texture, and are more lasting than those grown under glass. Borders for them need not be very elaborate; thorough drainage is essential, and may be secured by placing from nine inches to a foot of brick rubble at the bottom, on which should be placed some turves, laying them closely together, grass downwards, to prevent the soil from working through to the drainage. A border two yards long, one yard wide, and two feet deep, will be ample for many years. The staple of the border should be good turfy loam, in which some lime rubble, stick charcoal, and a little bonemeal has been incorporated.—GEO. WOODGATE, Rolleston Hall Gardens.

PROTECTION OF FRUIT TREE BLOSSOMS.

Not the least of the many vexatious trials that naturally fall to the lot of the gardener is that of the destruction wrought by cold winds and spring frosts to the blooms of early-flowering fruit trees, and this happens after much labour has been bestowed upon the trees. This is unfortunately a very common occurrence, though certainly some cultivators in this respect, owing to their trees being placed in favourable situations, are less exposed to these disheartening conditions than are others. In some instances, it is almost useless to go to the trouble and expense of planting and cultivating trees, unless some artificial means of protection is provided to contravene the evil effects of frost. In the case of such early-flowering fruits as apricots, peaches, and nectarines, this is especially necessary, while similar precautions have to be taken under some circumstances to insure success with more hardy fruits, such as pears, plums, and strawberries.

At the present time, the buds of trees are considerably later in development than is often the case at this season of the year, but we can scarcely expect, unless some kind of efficient protection is given, the blossoms of early-flowering trees that are placed in exposed positions, to escape being damaged by late frosts. Not even are they likely to escape where the branches during the winter have been loosened and drawn away from the walls, as is sometimes recommended and practised. This practise, provided the branches are not again secured to the walls until the flower buds are well advanced, undoubtedly retards to an appreciable degree flower development, though not, in ordinary cases, to an extent to make artificial protection unnecessary.

For reasons well understood, spring frosts are much more prevalent and severe in some places than they are in others, and therefore the kinds of protectors that are usually efficient in some cases are next to useless in others. For instance, the blossoms of peaches and nectarines, in an unheated house, especially if retarded by the house being kept open, and cool, to as late a period as can be safely done, are, in most cases, safe. Here, however, we found it necessary to heat a house of 100ft. in length, by 14ft. in width, in order to prevent the blossoms being destroyed by frost. A crop was almost totally ruined at the end of March some years ago, and we have since used artificial heat. Removable glass copings have here proved to be of no material value in the protection of apricots, peaches, and nectarines. They keep the blossoms dry, and therefore render them less susceptible to injury from frost, and to a degree hinder radiation, these benefits are not efficient. If used in summer and autumn, particularly in cold, damp seasons, these appliances do beneficial service in accelerating the ripening of fruit and wood, but, unless the trees are properly syringed, they suffer, as they are deprived of dew and rain.

For trees upon walls woollen, canvas, and tiffany blinds are good protectors, and are most expeditiously lowered or raised by means of suitable pulleys. They must be kept away from the trees by the aid of poles. Woollen and fish nettings are used with success in some instances, but the latter must be doubled or trebled in thickness. An advantage to be gained in using these is, they need not be removed by day. The above appliances can also be employed for bush, pyramid, and espalier trees in the open, but when this is done light frames of wood should be erected to keep them away from the trees: branches of suitable evergreen trees or shrubs, if carefully secured, so as to avoid their injuring the blossoms in windy weather, may be used for wall trees with excellent effect.

I know of nothing so suitable for strawberries as are strips of tiffany. If they are of the same length as the rows of plants they can be readily placed in position over the rows in the evening, and removed and laid between the rows in the morning, by two individuals, one being placed at each end. In our low, moist situation, it is every spring necessary to protect the blossoms of strawberries, otherwise at least the crown blossoms, even of the latest flowering varieties, would be destroyed. The tiffany will last many years if carefully dried and stored while not in use. I can imagine a grower of strawberries for market passing a not very flattering opinion about this method, but then, such a grower would not select for his plantations positions of the description that we have to deal with.

T. Coomber.

The Hendre Gardens.

SEASONABLE WORK AMONG HARDY FERNS.

As hardy ferns commence, as a rule, to throw up their new crop of fronds in April, and, in point of fact, commence root action some time before, as may be seen by the swelling crowns of Shield Ferns, Lastreas, and others of the crown forming group, it is well to anticipate this by doing any shifting, dividing, or repotting which may be necessary in the early part of April.

Thanks to the long winter rest, the ferns at this time are full of energy and in the best condition to withstand the shock of removal or division, while the future fronds, being still snugly ensconced within the crown, are not liable to damage, and the drain upon the root resources is far less than it would be later on, when the new set of fronds are lifting and expanding vigorously. In this connection, it may be pointed out that every individual fern frond has its own independent bundle of roots, and even before they rise these may be seen creeping down from the frond bases into the soil with tender, whitish growing points well in evidence. Hence, it is essential in the operations which we have in view that these should be injured as little as possible, as, if damaged, the fronds are sure to suffer.

The deciduous ferns, which die completely down in the autumn, are the easiest to deal with. These are the Lady Ferns and most of the Lastreas or Buckler Ferns, of which nothing is seen during the winter but the crowns themselves, covered possibly with the débris of dead fronds of the last season. It is not wise to clear this débris away too soon, as it forms a natural protection, and to remove it for neatness' sake without replacing it with a mulching of dead leaves is apt to lead to impoverishment by dry March winds through the checking of growth of the new young roots aforesaid. Where ferns grow naturally, and most robustly, we usually find the crowns buried in shed leaves and fronds, and Nature is always the best guide. The evergreen ferns, such as the Shield Ferns, Polypodium vulgare, Blechnum spicant, and Hartstongue, retain their frondage until a fresh crop arises, and, with these, any fronds which are green are best left, only dead or obviously dying ones being removed.

In the case of the crown-forming ferns, the Shuttlecock type, as we may term it, in which the fronds arise in a circle round a definite centre, it is very beneficial to the development of full character (we are speaking here of the beautiful varieties which we have always in view as being the only ferns which should be in collections proper) that single, i.e., separate crowns be grown. In time a single crown is apt to produce lateral offsets, or may itself split up into several, and, if not separated, the result is a bush of much smaller plants than is the case where separation is effected, owing to competition in the soil of the several sets of roots, and in the air of the sets of fronds, which thus become mixed together, to the detriment of their graceful individual habits.

The lateral offsets are easily removed, as they are only attached to the parent plant by a small ligament, the neck of the original bud, and can thus be prised off with a blunt instrument, when each will be found to be furnished with its own root system, and thus be in a condition to establish itself easily as an independent plant. Where the original crown has multiplied itself by fission, as is often the case with the Lady Fern, separation can only be safely effected when each crown has a definite neck, due to its own upward extension. They can then be divided by making a shallow cut in the indentation and pulling them apart, taking care not to squeeze the upper part of the crown, in which the future fronds are packed. As with the offsets, each division will then came away with its own roots, and needs only potting up or replanting to become an independent specimen.

Ferns with creeping root-stocks, like the Polypodies, are best left alone unless propagation be desired, in which case each piece of rootstock bearing a frond or two and a growing point, will establish itself if planted in a loose open compost near the surface. The Hartstongue is apt to form a number of small crowns, and is difficult to treat on single crown lines; but for propagating purposes, it is easy to see how the crowns can be separated and treated as described. Every bit of the caudex will produce buds if cut up and kept close.

Nearly all British ferns do quite well in the open in shady, sheltered spots in ordinary garden soil, but in pots they need a compost of leaf-mould or peat mould, mixed with an equal amount of good loam, with a good dash of silver sand. Pots and pans should be well drained, and not stood in saucers, especially with newly-potted plants, since much as ferns like damp positions few are capable of holding their own in constantly saturated soil. If a fern is doing well in a pot it is best left alone, since, when once well rooted and established in a pot or pan large enough for a full-sized specimen, they will hold their own for years undisturbed. Young plants, however, must naturally be shifted into somewhat larger pots from time to time until they attain full size.

Many of the Shield Fern varieties produce bulbils on the fronds near the base, and some of them in profusion all the way up. In clearing away the dead fronds, the basal buds are worth looking after, as affording a means of propagating some of the rarer forms. They only need detaching with a short piece of stalk and inserting in good compost just level with the soil, preferably at the edges of the pot or pan.

Chas. T. Druery, V.M.H., F.L.S.

"CARNATIONS, PICOTEES, AND PINKS," will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

There was a grand show on April 6, consisting largely of orchids, alpines, daffodils, and forced shrubs, and, as the day was a bright spring one, there was a great crowd of Fellows and visitors to see the splendid display.

FLORAL COMMITTEE.

The exhibit of pink cinerarias of the florists' type, shown by Messrs. Sutton and Sons, Reading, proved a great attraction for the ladies because the range of colour shades from light silvery-pink to deep old rose-pink was very wide and beautiful. Needless to say, the plants were all well grown and finely flowered. Mr. F. Anderson, gardener to Mrs. Bischoffsheim, The Warren House, Stanmore, contributed a pyramidal group of Lachenalia tricolor. A glorious lot of Himalayan rhododendrons were brought up by Mr. R. E. Gill, from Falmouth, all the blooms cut from the open, without protection; R. Shilsoni, R. barbatum, R. Harrisi, R. arboreum, and R. giganteum were all specially beautiful.

Very bright was the corner group of Ceanothus Veitchianus, Pyrus angustifolia fl.-pl., camellias, Pyrus Scheideckeri, and P. malus floribunda, arranged by Messrs. William Paul and Son, Waltham Cross. Messrs. G. Jackman and Son, Woking, were represented by charming groups of single blue primroses, Primula denticulata alba, Scilla siberica and its white variety, and single blue hepaticas. Messrs. H. B. May and Sons, Edmonton, brought up the new Nephrolepis Amerpohli, dwarf roses, and pot clematis. Messrs. Paul and Son, Chesnunt, showed a few interesting flowering shrubs, including Cytisus Butterfly, Deutzia discolor arcuata, and Viburnum plicatum tomentosum.

Mr. G. Reuthe, Keston, was represented by a large group of lovely hepaticas, daphnes, rhododendrons, primulas in variety, camellias, and other early flowers. A bold display of forced shrubs, hepaticas, hardy primulas, etc., was made by Messrs. W. Cutbush and Son, Highgate, this firm also contributing a display of perpetual carnations. The beautiful and useful Primula verticillata, clothed with multitudes of yellow flowers on mealy stems, was splendidly shown by Mr. Cransfield, gardener to Sir Everard Hambro, K.C.V.O., Hayes Place, Hayes, Kent, who set up a big group of beautiful plants.

Beautiful roses were shown by Mr. G. Prince, Longworth, Berks, the features of the group being Marechal Niel, Prince de Bulgarie, and the charming Madame Jules Gravereaux. Some well-grown amaryllis, fine in colour, but rather lacking in form, were shown by Mr. F. Baker, gardener to Major Lister, Warminglid Grange, Haywards Heath, who can grow these bulbs finely. Messrs. G. and A. Clark, The Nurseries, Dover, had a small rockwork group and a tiny pool of water, the whole furnished with primulas, primroses, irises, clematis, and dwarf shrubs.

A magnificent group of forced Azalea mollis in variety, beautiful and fragrant lilies, magnolias, wistarias, pyruses, laburnums, and guelder roses, was very pleasingly set up, and prettily arranged with ferns and palms, by Messrs. R. and G. Cuthbert, Southgate, who are adepts at this particular culture. A good strain of cyclamens was presented by Messrs. Whitelegge and Page, Chislehurst, Kent. Acacias were largely shown by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, and their yellow, fragrant flowers were very much admired; these with roses and perpetual carnations made up a large display.

Indian azaleas were beautifully shown by Messrs. James Veitch and Son, Chelsea, with fragrant Boronias megastigma and heterophylla, clivias, blue hydrangeas, beautifully formed and richly hued amaryllis, seedling gerberas, and a grand bank of Mons. Thiers and other early rhododendrons. Rock plants and early hardy flowers in great variety and beauty were largely shown by Messrs. T. S. Ware, Lim., Feltham; Anemone fulgens, Tulipa Greigi, Androsace carnea eximia, and gold-laced polyanthuses were particularly striking. Messrs. H. Cannell and Sons sent cactus-flowered cinerarias, interesting cacti, and the free flowering Begonias manicata, nitida, and Verschaffelti. Rambling roses such as Trier, Gruss an Zabern, Mrs. F. W. Flight, Leuchtstern, and Thalia were well shown by Messrs. Frank Cant and Co., Colchester, who also had the new single variety Joseph Billard, yellow and rose, and sweetly scented.

Some charming rosy-hued amaryllis were shown by Messrs. R. P. Ker and Son, Aigburth, Liverpool, and one of these, a beautifully formed flower with deep crimson centre, shading to old rose margins, named Magnificent, gained an A.M. Beautiful carnations, liliums, roses, and daffodils, all set up boldly in big vases, by Mr. W. H. Page, Tangley Nurseries, Hampton, made a grand exhibit.

A beautiful bank of grand carnation blooms, from Mr. H. Burnett, Guernsey, was greatly admired, especially the vases of Enchantress, Marmion, Mikado, and Fortuna. Messrs. Bakers, Wolverhampton, had beautiful groups of Primula denticulata, the double Welsh poppy, Saxifraga apiculata, S. Burseriana, polyanthuses, Cypripedium pubescens, and other charming flowers.

A fine group of carnations was arranged in the annexe by Mr. Paskett, gardener to E. J. Johnstone, Esq., Burr Woods, Groombridge, Kent. It was a great attraction—it consisted of growing plants, as well as cut blooms. Enchantress, Britannia, Rose-pink Enchantress, Aristocrat, and Sarah Hill were the varieties most largely shown. Messrs. R. Wallace and Co., Colchester, arranged a pretty and low rock garden arrangement on the central table in one of the annexes, and filled it daintily with tulips, gentians, muscaris, crocuses, the beautiful Primula viscosa Mrs. J. H. Wilson, fritillarias, daphnes, Anemone pulsatilla, and Iris reticulata.

ORCHID COMMITTEE.

The finest feature of the whole meeting—and it was a magnificent one—was the superb group of orchids arranged along the end of the hall by Messrs. Armstrong and Brown, Tunbridge Wells. It was a grand effort on the part of one firm, and it was admired, as its merits deserved. In the centre was a raised group of Cymbidium Lowianum and odontoglossums, the latter throwing their beautiful spikes of bloom out in a graceful manner from the groundwork of moss and ferns. On either side of these were big groups of the exquisite Dendrobium nobile virginale, and one may safely say that such masses of finely grown plants of this choice orchid have never before been seen. At the extreme ends were coloured dendrobiums of very many kinds, all superbly grown, and in the valleys between these bold groups were small colonies of Cypripedium glaucophyllum, etc., and specimen plants of Odontiodas, Brasso-cattleya Thorntoni var. Boydæ, and Dendrobium formosum giganteum. Unquestionably the Tunbridge Wells firm has come to the forefront with a bound.

Messrs. Hugh Low and Co., Bush Hill Park, had in their orchid group good forms of Cattleya Trianæ, Cypripedium Wm. Lloyd, C. Rossetti, Cœlogyne pandurata, and Cymbidium Holfordianum. Messrs. Charlesworth and Co., Haywards Heath, showed Cœlogyne pandurata, the vivid orange-coloured L.-c. Elinor, Angræcum sesquipedale, and a fine spike of Odontoglossum Ossulstoni. A bold group of orchids was set up by Messrs. Jas. Veitch and Sons, Chelsea, who contributed Cattleya Schroderæ, Brasso-cattleya Elatior, the beautiful Cymbidium insigne Sanderi, C. Lowianum, and odontoglossums in variety. Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, showed the dark Odontioda Ernest Henry (F.C.C.), in a group of odontoglossums, cattleyas, and other choice orchids.

Messrs. J. and A. McBean, Cooksbridge, showed odontoglossums superbly, with some cattleyas. Mr. A. W. Jensen, Haywards Heath, showed Cattleya Schroderæ Irene (F.C.C.), and a few other pretty varieties of this species. From Messrs. Sander and Sons, St. Albans, came Odontoglossum Dreadnought (A.M.), several Brasso-cattleyas, odontoglossums, and Cattleya Schroderæ. Mr H. J. Chapman, gardener to N. C. Cookson, Esq., Oakwood, Wylam-on-Tyne, brought up Odontoglossum percultum Cookson's var., very deeply coloured (F.C.C.), O. crispum Angela, finely marked (A.M.), and O. Harryanum-crispum album. Some charming dendrobiums, chiefly yellowish hybrids, were submitted by Mr. R. G. Thwaites, Christchurch Road, Streatham. Mr. M. Mertens, Mont St. Amand, Ghent, brought over a small group of beautiful unnamed odontoglossums. From the Westonbirt collection, Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, brought Cattleya Schroderæ The Baron (F.C.C.), C. Ro[illegible] Wavrin, and Odontoglossum Sylvia Westonbirt var. (A.M.).

Mr. W. Thompson, Walton Grange, Stone, and Mr. De Barri Crawshay, Sevenoaks, showed odontoglossums, the latter bringing up the renowned O. triumphans L[illegible] Crawshay. Messrs. J. Cypher and Son, [illegible]tenham, exhibited a charming little group of dendrobiums.

DAFFODIL COMMITTEE.

Messrs. Barr and Sons, Covent Garden, set up a collection of early daffodils, setting up the flowers lightly over small [illegible]. A few of the more notable varieties [illegible] J. B. M. Camm, Henry Irving, Mdme. [illegible] Graaff, King Alfred, Lucifer, Mrs. B[illegible]ridge, Sunrise—very pretty, Chas. H. C[illegible] Sabrina, Albatross, Ard Righ, and F

Queen. Mr. R. Sydenham, Birmingham, showed daffodils, tulips, and lily of the valley, grown in undrained pans and pots in moss fibre. An interesting display of bulbous flowers was contributed by Messrs. R. H. Bath, Lim., Wisbech, who showed a large number of tulips in fancy bowls in moss fibre, and associated with these a few daffodils, and a large number of vases of Chionodoxa Luciliæ.

Mr. Frank Lilley, Guernsey, showed a bright group of daffodils, set up in vases and bamboo stands; popular trumpet and incomparabilis varieties were grouped with tazetta varieties, and vases of St. Brigid anemones, scillas, chionodoxas, and tulips. Messrs. Jas. Carter and Co., Holborn, displayed daffodils and tulips in a novel and interesting way; the great feature of the group was the central mound or slope filled with scores of fine flowers of the bold King Alfred daffodil. Around this the tulips were grouped, and the whole effective and imposing exhibit was greatly admired. Some delightful daffodils were displayed prettily by Messrs. Cartwright and Goodwin, Kidderminster, whose choice collection included King Alfred, Mdme. de Graaf, Orangeman, Brigadier, Beacon, Outpost, Armorel, Castile, Evangeline, Mariette, Duke of Bedford, and Crown Prince.

Mr. Charles Dawson, Rosemorran, Gulval, Cornwall, contributed several dozen beautiful new daffodils, including such lovely things as Homespun, Cicero, Waxwing, Binda, Pilgrim, Punch, Diogenes, and Macebearer. Miss F. W. Currey, Lismore, Ireland, showed Daffodils Sir Watkin, King Alfred, Mrs. Elwes, Sunrise, Sirius, Empress, Artemis, and other good varieties.

FRUIT COMMITTEE.

A dozen dishes of excellent apples came from Mr. F. Harvey, gardener to Lord Monson, Burton Hall, Lincoln, the varieties being Newton Wonder, Alfriston, Bramley's Seedling, Lane's Prince Albert, Cox's Orange Pippin, Allington Pippin, Blenheim Pippin, The Queen, Beauty of Kent, and King of the Pippins. Splendid stems of Dawes' Challenge rhubarb (A.M.), a grand variety, very free and of rich colour, were exhibited by Mr. T. E. Dawes, Syderstone, Norfolk, the raiser.

Boxes of excellent Black Crepe and Golden Queen lettuces, and Early Gem, French Breakfast, and Early Forcing Turnip radishes came from Messrs. James Veitch and Sons, Chelsea: all these were grown under the French system. Oranges were again finely shown by Messrs. T. Rivers and Son, Sawbridgeworth, the firm showing some large branches, trained like peaches on wires, to show how these may be grown under glass. St. Michaels orange was grandly shown among numerous other excellent varieties.

A splendid lot of frame-grown lettuces was exhibited by Messrs. Sutton and Sons, showing the value of certain varieties for early salading. The varieties were Golden Ball, Tom Thumb, French Tom Thumb, Early Paris, Commodore Nutt, and Fringed, all cabbage varieties; and Little Gem and Sutton's Nonsuch Cos lettuces, all very fresh and appetising. Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, won first prize for six kinds of salading, with fine samples of Sutton's Christmas Salad Chicory, Curled Cress, and White Mustard, Sutton's Forcing Lettuce, and Golden Ball French Breakfast radish, Peerless cucumbers, and spring onions.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Cattleya Schroderæ The Baron, from Lieut.-Colonel Holford, Westonbirt.

Odontoglossum percultum Cookson's var., from N. C. Cookson, Esq., Oakwood, Wylam-on-Tyne.

Odontioda Ernest Henry, from H. S. Goodson, Esq., Putney.

Odontoglossum Sylvia Westonbirt var., from Lieut.-Colonel Holford.

Award of Merit.—To Odontoglossum Dreadnought, from Messrs. Sander and Sons, St. Albans.

Cattleya Schroderæ Irene, from Mr. A. W. Jensen, Haywards Heath.

Odontoglossum crispum Angela, from N. C. Cookson, Esq.

Lælio-cattleya Frederick Boyle var. Kerchovæ, from Sir Trevor Lawrence, Bart., Dorking.

Cattleya Schroderæ var. Alexander James, from Mr. W. James.

Hippeastrum Magnificent, from Messrs. R. P. Ker and Son, Liverpool.

Hippeastrum Marcus, from Messrs. J. Veitch and Sons, Chelsea.

Saxifraga apiculata alba, from the Guildford Hardy Plant Company, Guildford.

Rhubarb Dawes' Challenge, from Mr. T. E. Dawes, Syderstone, Norfolk.

MEDALS.

Gold.—Messrs. Armstrong and Brown, Tunbridge Wells, for orchids.

Silver-gilt Flora.—Messrs. R. and G. Cuthbert, Southgate, for forced shrubs; Messrs. James Veitch and Sons, Chelsea, for flowering plants.

Silver-gilt Banksian.—Messrs. William Cutbush and Son, Highgate, for forced shrubs and carnations.

Silver-gilt Knightian.—Messrs. T. Rivers and Son, Sawbridgeworth, for oranges.

Silver Flora.—Mr. H. Burnett, Guernsey, for carnations; Messrs. H. Low and Co., Enfield, for acacias and carnations; Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; Mr. W. H. Page, Hampton, for carnations and lilies; Mr. G. Prince, Longworth, for roses; Messrs. R. W. Wallace and Co., Colchester, for alpines; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Messrs. J. and A. McBean, Cooksbridge, for orchids; Messrs. J. Veitch and Sons, Chelsea, for orchids; Messrs. Cartwright and Goodwin, Kidderminster, for daffodils.

Silver Banksian.—Mr. M. Mertens, Ghent, for orchids; Mr. A. W. Jensen, Haywards Heath, for orchids; Messrs. Hugh Low and Co., Enfield, for orchids; Major Lister, for amaryllis; Messrs. H. Cannell and Sons, Swanley, for begonias; Misses Hopkins, Shepperton, for alpines; Messrs. G. Jackman and Son, Woking, for alpines; Messrs. J. Peed and Son, West Norwood, for caladiums and alpines; Mr. E. J. Johnstone, Burr Woods, for carnations; Mr. G. Reuthe, Keston, for alpines and shrubs; Mr. L. R. Russell, Richmond, for forc'd shrubs; Messrs. Sutton and Sons, Reading, for cinerarias, and for lettuces; Miss Alexander, for violets; Messrs. T. S. Ware, Lim., Feltham, for alpines; Messrs. Barr and Sons, Covent Garden, for daffodils; Mr. Charles Dawson, Penzance, for daffodils.

Bronze Flora.—Messrs. Bakers, Codsall, for alpines.

Bronze Banksian.—Mrs. Bischoffsheim, Stanmore, for lachenalias.

Bournemouth, MARCH 30 and 31.

On the above dates a most successful exhibition of spring-flowering plants and cut blooms was held in the spacious pavilion at the winter gardens. The building lends itself to the artistic arrangements of plants in groups and flowers of all kinds, admirably. This was the second spring show held by the Bournemouth Horticultural Society, but last autumn saw the twenty-second annual chrysanthemum show. The committee hope to hold spring shows every year in future, in addition to the autumn exhibition.

The entries were on this occasion more numerous than last year, and the quality of the exhibits superb. Six charming groups of miscellaneous plants were arranged. Messrs. G. Watts and Sons, of Bournemouth, were the winners with a very pretty group, in which cinerarias and hydrangeas were notable plants. Second honours were won by Mr. T. K. Ingram, nurseryman, Parkstone, Dorset, the azaleas, wistarias, and genistas in this group were most attractive. Mr. Slark, gardener to G. T. Fenwick, Esq., J.P., who was placed third, also had a lovely group.

Dinner-table decorations were tastefully arranged. Narcissus blooms only were used, but any kind of foliage allowed. Mr. C. S. Wadey, Broadstone, Dorset, won premier honours; Mr. Usher, gardener to Sir Randolph Baker, Bart., gained second place, and Mr. W. Shave, gardener to Lady de Tabley the third, all the arrangements were light and graceful. Azaleas made a fine display. Mr. T. K. Ingram, nurseryman, Parkstone, was first prizeman in the classes for six plants of A. mollis and A. indica, with specimens loaded with blossom.

For twelve pots of narcissi, Mr. Usher was first, and Messrs. Ingram and G. Watts and Sons were second and third. Messrs. Watts and Sons had the best six pots of Polyanthus narcissus, Mr. Ingram being second. For twelve pans of tulips Messrs. Watts were first, and Mr. Ingram second. The plants were grand ones. The class for eighteen varieties of narcissi was magnificently filled. Mr. Usher was placed first, Mdme. de Graaff, Golden Spur, and Sir Watkin being staged in grand form. Messrs. Watts and Sons secured second position, and Glory of Leiden, Victoria, and Maximus were their most prominent vases of blooms. Mr. Ingram was awarded third prize. Mr. Usher again scored in class eleven for five blooms of large trumpets, Mr. Wadey being second. Mr. Wadey was successful in the class for five blooms of medium trumpet daffodils. Messrs. G. Watts and Sons, Messrs. Thurston and Prichard, and Mr. Wadey were the prizewinners for shower bouquets in the above order. For a circular table of floral decorations, Mrs. W. Shave was placed second, but she had the best display.

Mr. Usher had the best collection of twenty-five distinct varieties of daffodils—they were well staged—Golden Spur, Glory of Leiden, and Mdme. de Graaff being very fine. Mr. R. F. Northway, Broadstone, Dorset, was second; his blooms were much smaller, and were lacking in length of stem. Mr. C. Barrett, gardener to Mr. E. Howard May, J.P., Colonel Churchill, Mrs. Ormond, Mr. Sprackling, and Mr. Heath were also prominent prizewinners.

Some charming trade exhibits were staged. Mr. Chamberlain, treasurer of the society, had floral designs; Messrs. Cypher and Sons, Cheltenham, orchids in grand form; Mr. Maurice Prichard, Riverslea Nursery, Christchurch, rockery complete with lovely plants; Messrs. Sutton and Sons, Reading, a grand group of cinerarias; and Mr. Hayward Mathias, tree carnations. Gold medals were awarded to each of the above-named firms, and silver medals to Mr. G. H. Rolls, J.P., chairman of the committee, for orchids; Messrs. Heath and Sons, Cheltenham, for alpines and tree carnations; Mr. E. Gill, Falmouth, cut rhododendron blooms; Miss Jessie Kent, floral designs; and Messrs. Barr and Sons, Surbiton, alpines, narcissi, and tulips.

Fig Brown Ischia.—I do not think this fig is grown as much as its merits deserve. The fruit is handsome, and the flesh is purple, sweet, and highly-flavoured. If, however, the tree has too much moisture, the fruit is apt to split. Therefore, it is better suited for indoor culture than for positions outside, except it can be protected by coping of some sort at a time when the fruit is approaching the ripening stage. The tree is an excellent bearer, and the fruit has a light brown or chestnut-coloured skin.—E.

Scutellaria Ventananti.—The Mexican Scutellaria Mociniana is deservedly very popular for the embellishment of the greenhouse during the summer months, but S. Ventenanti, though introduced from Colombia about sixty years ago, is but little known. It is a soft-growing, freely-branched plant, in general appearance somewhat suggesting a salvia. The flowers, borne in erect racemes about six inches long, are tubular, and individually small, but borne in great profusion. The colour is a deep, bright scarlet. It is of easy culture, and certainly merits more extended cultivation.—W. T.

NARCISSUS CULTIVATION.

In a very interesting article on "Narcissus Cultivation," by Mr. James Waugh, published in the "Journal of the Board of Agriculture," the writer, previous to dealing with the cost of varieties and production and sale of blubs and flowers, points out that:—

Until ten or twelve years ago the Dutch had almost a monopoly of the bulb trade of this country, but recently bulb cultivation has been successfully undertaken in various parts of the British Isles, and the new industry thus created has brought prosperity to several districts.

Districts where Bulbs are Grown.

In the Channel Islands bulb culture is one of the chief industries, and during the spring months tons of bloom are daily despatched to London and other large centres, to be followed in summer by the further despatch of tons of bulbs. In the South Lincoln and Cambridgeshire Fens many acres of bulbs are now grown, several of the larger growers having from twenty to fifty acres under cultivation. An ideal bulb soil is found here, which, with good culture, will produce bulbs equal to those grown in Holland, and, in addition to supplying a home demand, a considerable export trade is now being conducted from this centre.

In the South of England narcissus cultivation has been receiving the attention of enthusiasts for many years, and from this source many of the newer and more expensive introductions of recent years have been sent. In the Midland Counties several nurserymen and amateur specialists are successful cultivators, and this year bulb-growing is being tried on commercial lines at Portmadoc, in North Wales. In Ireland also narcissi are now successfully and extensively grown in localities so far apart as County Down in the north, Cork in the south, Dublin in the east, and Sligo in the west.

From this it will be gathered that, given suitable soil and cultural knowledge, narcissi can be grown successfully in almost any part of the British Isles. Their culture may be undertaken by those occupying small holdings and allotments, and in conjunction with other crops they may be grown with every prospect of yielding the grower a profitable return on his capital. The present article is intended to give such holders an indication of the elementary principles of bulb culture, dealing first with the growth of bulbs for sale as bulbs, and secondly as blooms.

Growing Bulbs for Sale.

The soil best suited for narcissus cultivation is a deep, friable loam. Stagnant moisture is detrimental to the plants, and where such a condition exists it must be remedied by draining and raising the beds above the level of the paths. All the varieties recommended below will flourish in loam, and some few will succeed in somewhat stiffer soil.

Land from which an early crop of potatoes has been lifted furnishes a very suitable soil for narcissi. When preparing it for the potato crop, the land ought to receive a heavy dressing of farmyard manure, from fifty to sixty tons per acre, according to the condition of the soil. As soon as the potatoes are cleared off, at the end of July or beginning of August, the land should be deeply ploughed or dug so that the enriched top spit is placed in a position to allow the roots of the narcissi to penetrate freely. If it is infested by weeds such as twitch, bindweed, thistles, docks, etc., these ought to be removed as the work proceeds, as it is impossible to eradicate such pests once the bulbs are planted; a determined effort must therefore be made to remove them before the bulbs are put in the soil. If the work has been done by the plough, the ground should be broken up by harrowing and rolling; but if dug by the spade it should be broken up as digging proceeds. This accomplished, and a good tilth obtained, the land is then ready for planting. The soil should be uniformly level, as hollows in which water stands injuriously affect the bulbs.

Fresh farmyard manure must never be used in connection with narcissus cultivation; its ammoniacal constituents have an injurious effect upon the plants, and this is the chief reason for recommending that they should follow such a crop as potatoes, where the rankness of a heavy manuring has already expended itself. Some may think sixty tons of farmyard manure per acre an unnecessarily large amount, but unless the ground is in good condition this is no excessive quantity. Good bulbs, like most other crops, cannot be grown on poor land. If it becomes necessary to plant on land which has not recently been well manured, bone-meal is probably the best artificial manure to use at time of planting. This should be applied at the rate of ten to fifteen cwt. per acre, and can either be harrowed and raked in before planting commences, or worked in as planting proceeds.

Planting.

As a general rule, the shorter the period the bulbs are out of the ground the better. In some cases, such as the Poeticus section, new roots are formed simultaneously with the drying of the old, and a decided injury is done by keeping such varieties out of the ground for a lengthened period. Nevertheless, narcissi, with few exceptions, may be planted as late as Christmas, and still give fair results; but the best time for general planting is during August and September, and all planting should certainly be finished during October. The ground should be dry and friable at the time of planting, which should be done at a depth of two to four inches—the larger bulbs at the greater depth and the smaller ones proportionately shallower.

Various methods of planting are adopted, and the amount of space to be planted will influence the method decided upon. Many large growers use a one-horse plough, to which is fixed a special share that works in the bottom of the furrow and makes the necessary impression for the reception of the bulbs; and on large establishments the work is expeditiously performed in this way. From twenty-four to thirty planters are necessary to keep the plough constantly at work, and an acre a day may be planted. The cost would be: Man and horse per day, 8s.; thirty planters at 2s., £3; man in charge, 4s.; total, £3 12s. per acre.

The above method is suitable where any one variety of bulb is being planted in large quantities. The work proceeds in the ordinary way of ploughing, one furrow covering the already planted bulbs in the furrow previously made. The furrows are about nine or ten inches wide, and every seventh furrow is left unplanted, and this forms a path, which is necessary for getting among the bulbs when bloom-gathering, cleaning, etc.

Where smaller areas are being planted, a different method must be adopted. First divide the land into suitable divisions, say, fifty feet wide, with eighteen-inch paths between. Then stretch a line across the end of the first division, and with a spade throw out a shallow opening in which to plant the first row of bulbs. This done, shift the line the width of the rows, say, nine inches; then proceed to open the second furrow, covering the first and already planted row with the soil from the second. Proceed thus with succeeding rows, again leaving every seventh unplanted to form a path. By this method one man with a spade will keep two planters busy, and the cost will be about £6 per acre.

Another method for the small grower, after he has marked his land into fifty-foot divisions with eighteen-inch paths, is to mark each division across with beds 3 feet 6 inches wide, and with paths 12 inches wide. The soil from the first bed is taken out to a depth of 3 inches and wheeled to the far end of the division; this first bed is then carefully raked, and marked across in rows 6 inches apart. The bulbs are then planted, and this bed is covered with soil taken from the second bed, and so the work proceeds to the end of the division. This [illegible] although a little more expensive [illegible] preceding, has advantages, especially [illegible] handling a considerable number of varieties in small quantities, as the danger of mixing sorts is less likely to arise.

The quantity of bulbs necessary to [illegible] given area will vary considerably, [illegible] ing to the size of bulb produced by the particular variety. From five to six tons may be taken as an average weight to plant an acre.

(To be continued.)

OBITUARY.

◆

MR. BEN SIMONITE.

With much regret we record the death of Mr. Ben Simonite, which occurred at his residence, Sheffield, a few days since. Mr. Simonite, who was in his 76th year, was one of the keenest of florists, and most [illegible] of men, and devoted his spare time chiefly to show auriculas, and both as a grower and a raiser he achieved considerable distinction. Mr. Simonite was long a familiar [illegible] the various exhibitions held in the [illegible] and midland counties, for he was so [illegible] esteemed by those who were keenly [illegible] ested in florists' flowers that if he was not an exhibitor his services were in request as a judge.

MR. C. JEFFRIES.

We regret to have to record the sudden death of Mr. Charles Jeffries, of Brentford, on Tuesday, April 6. Mr. Jeffries was for many years gardener to Colonel Cli[illegible] at Boston House, Brentford, and was [illegible] known and respected in the old M[illegible] county town. He was for several [illegible] member of the Royal Horticultural [illegible] Floral Committee, and he interested [illegible] in the work of the Gardeners' Orphan [illegible] He retired from the charge of the [illegible] House gardens on the death of Col[illegible] Clitheroe, and had latterly acted as adviser and superintendent of several gardens in the district. Mr. Jeffries was twice married, and he leaves a widow and little son to mourn their loss.

MR. W. BURTON.

Mr. Burton, who recently died at [illegible] vanced age, at Highgate, was at [illegible] very well known in horticultural circles [illegible] ticularly during the period when [illegible] manager of Messrs. B. S. Williams and [illegible] Paradise Nurseries. In recent years [illegible] acted as traveller for several firms, and latterly for Mr. L. R. Russell, of Richmond.

FORTHCOMING ENGAGEMENTS.

MONDAY, April 12.—Easter Monday.

SATURDAY, April 17.—Seascale Spring Show.

TUESDAY, April 20.—Royal Horticultural Society Orchid, Narcissus Committee, at 11.30 a.m.; [illegible] Floral, and Fruit Committees, at 12 [illegible] ture at 3 p.m. on "Pansies," by Mr. [illegible] D.Sc.; Scientific Committee, at 4 o'clock. Devon Daffodil Show, at Plymouth; two d[illegible] Shropshire Horticultural Society's Spring Show. National Auricula and Primula Show, at [illegible] Horticultural Hall.

CATALOGUES RECEIVED.

G. REUTHE, FOX HILL NURSERY, KESTON.—An illustrated and interesting catalogue of [illegible] and especially choice hardy plants suitable [illegible] gardens, bulb borders, water [illegible] etc.

BARR AND SONS, KING STREET, [illegible] DEN.—This new catalogue [illegible] bedding plants, alpines, aquatics, climbers, bedding plants, it [illegible] well arranged, and, besides descriptions, it [illegible] many suggestions for planting, and cultural [illegible] that will be of service to amateurs.

HERBERT'S PARK POTTERY CO., DARLASTON, STAFFS.—A useful catalogue of flower pots, seakale and rhubarb pots, seed pans, ornamental garden pottery in great variety, and window boxes.

DESTRUCTION OF VERMIN.—[illegible] are pestered with Rats and M[illegible] should be made to exterminate [illegible] are sown. Danysz Virus is first rate stuff for [illegible] these vermin. Single tube, 2s.; three tubes, [illegible] free from DANYSZ VIRUS, LTD., 52, Lea[illegible] Street, Garden Dept. London, E.C.—[Advt.]

ANSWERS TO CORRESPONDENTS.

PRIMULA FORBESI.—C. H. E., Leamington: This delightful primula is almost hardy, but for greenhouse and conservatory decoration it may be conveniently treated as an annual. Seeds should be sown in September, and the seedlings grown cool, in a mixture of loam, leaf-mould, sand, and a very little rotten cow manure. Some growers place the plants singly in small pots; others grow several plants together in pans. Both methods are suitable.

PLANTING OUT SWEET PEAS.—G. W. B., Effingham: So much depends upon the position to be filled, and the condition of the soil. At the time of writing the wind is dead east, and blowing strongly, and the sun is shining brightly. These conditions are so drying, and altogether so unkind for newly-planted subjects of any kind, that we advise waiting a week or two, if necessary, for more favourable ones. If the pots are very full of roots, give a little very weak liquid manure twice a week to keep the plants growing steadily.

PRUNING TRANSPLANTED PEAR TREE.—J. T. E., Montgomery: It is unfortunate that the new division and its wall compelled you to transplant the pear tree at so late a date. The case would have been quite different had the tree been a young one. However, now that it has been transplanted, you must do the best you can. If the tree was not severely pruned during the winter, the knife may be used rather freely at once, thus reducing the area of evaporating surface. Three wires, guyed to stout posts, and carefully fastened round the central stem at about two-thirds its height, will serve to keep the tree steady. Make a basin-like depression around the stem, because water will be needed throughout the season; in a month's time a mulching of short manure over the root area will further help in keeping the roots moist. When the tree is in leaf, and the nights are warm, give a hosing or syringing late in the afternoon. By these means the tree may be preserved, and in a couple of seasons it will be as good as ever, and possibly be even more fruitful.

MEDINILLA MAGNIFICA. — P. P., March: This handsome plant may be propagated by means of cuttings of the young growth. These, about three inches long, should be soon available, and they root best when removed from the parent plant with a little ball of old wood attached. Insert them singly, in small 60-sized pots, in a sandy compost, and plunge the pots in a propagating case, where the bottom heat is brisk. A fair amount of root room, plenty of heat and moisture, and weak liquid manure when the pots are well filled with roots, are the chief points to remember in the culture of Medinilla magnifica.

GARDENERS' ORPHAN FUND. — E. G. H., Godmanchester: You are labouring under a grave misapprehension as to the method followed by the committee of the Gardeners' Orphan Fund in respect of the children that come under its care. The following extract from the rules will show you are quite wrong: "The allowances shall consist of any sum not exceeding five shillings per week, to children under the age of fourteen years, who, within the knowledge of the Executive Committee, may be placed with relatives or other responsible persons acting as guardians. Allowances shall be paid quarterly, in advance, except when the committee may consider it desirable to make other arrangements. No child shall receive annual support after having attained the age of fourteen years; but the committee may, at their discretion, in exceptional circumstances, continue the usual allowance for a further period not exceeding two years. Further, the Executive Committee, at their discretion, shall have power to grant a sum, not exceeding £10, towards apprenticing or otherwise promoting the start in life of any orphan on whose behalf application shall have been made to the committee. The committee shall also have power to grant, on application, a sum not exceeding £10 to any orphan who may have ceased to be chargeable to the fund, and who shall have given evidence of his or her satisfactory conduct during the subsequent twelve months. The Executive Committee shall have power to suspend allowances where the circumstances of candidates have been misrepresented, or have since altered so as to render further assistance unnecessary." You can obtain a copy of the rules on application to the secretary, Mr. Brian Wynne, Milton House, 35, Surrey Street, Strand, W.C.

HARDY FLOWERS FOR CUTTING. — F. G. H., Epsom: We have not included bulbous plants, but these are, of course, very useful in spring time for providing flowers for cutting. The annuals and biennials of exceptional value for the supply of cut flowers comprise aquilegias, the Californian and cærulea hybrids being especially useful. Asters in variety, the best types being the Comet, chrysanthemum-flowered, and Victoria, and the best colours crimson, pink, purple, and white. Chrysanthemums, annual, in variety, Coreopsis atrosanguinea, and C. hybrida floribunda, Canterbury Bells in variety, Helianthus cucumerifolius Stella, and the miniature sunflower, Centaurea minor, or cornflower in variety, larkspurs in variety, Blue Butterfly being one of the best, lupins, mignonette, stocks Ten Week, and sweet peas in variety. The latter should be grown in separate colours, and the most useful colours are blue, crimson, pink, rose, salmon, scarlet, and white. To ensure a continuous supply of flowers, nip off the seed pods immediately they begin to form, salpiglossis, sweet sul-

ORDER FORM.

To the Publishers of "THE GARDENERS' MAGAZINE" 148 & 149, Aldersgate St., London, E.C.
Please send me a copy of "THE GARDENING YEAR BOOK," 1909, for which I enclose 1/3.
Name ....
Address ....

tan, and Shirley poppies. From the hardy perennials may be selected Achillea millefolium roseum, A. Ptarmica The Pearl, and A. serrata fl.-pl.; Anemone japonica in variety; asters or Michaelmas daisies in variety, those with white, bright blue, and rose-coloured flowers being the most useful; campanulas in variety, the erect-growing forms, such as C. persicifolia and C. pyramidalis being the most useful; carnations in great variety; Centaurea montana in variety; Chrysanthemum maximum in variety; doronicums, Harper Crew being the best; francoas, Gypsophila paniculata, heleniums, Helianthus Golden Bouquet, H. multiflorus plenus, H. rigidus semi-plenus, H. Soleil d'Or; heuchera, iris in variety, the English, German, and Spanish being particularly useful. Perennial peas, the white form being especially desirable. Lupinus arboreus Snow Queen, Lychnis vespertina, montbretias; pyrethrums, single and double; pinks in variety, Iceland and Oriental Poppies, Rudbeckia Golden Glow, and R. speciosa; spiræas in variety; trollius in variety. For bold decorations the herbaceous pæonies are simply invaluable, and they provide a good range of colouring. These are among the best and hardiest of free-flowering plants, and you cannot do wrong in planting them freely.

CHOICE HARDY FLOWERS.—L. L. E., Amersham: You will find just the sort of information you require in the issue of the "Gardening Year Book" for 1909, where the various kinds of hardy flowers of greatest value for borders are described, and the several most suitable species and varieties enumerated, as well as cultural advice given. The book can be obtained from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C., 1s. 2d. post free.

POTATO TO NAME.—J. G., King's Lynn: It is practically impossible to name a potato from a single tuber, unless it be one of the very distinct coloured varieties. The specimen sent looks like a good example of Satisfaction, but this is merely an opinion, and must not be regarded as a correct title.

NAMES OF PLANTS.

F. W., Carnarvon.—Next week.

M. E. L., Derby.—Odontoglossum Adrianæ.

W. W. W., Tamworth.—1, Asplenium lucidum; 2, Lomaria magellanica.

S. O., Southampton.—1, Forsythia suspensa; 2, Cornus Mas; 3, Ribes sanguinea.

W. I., Bolton.—1, Spiræa Van Houttei; 2, S. prunifolia fl.-pl.; 3, the old Sparmannia africana.

G. T. H., Ipswich.—1, Acacia Riceana; 2, A. dealbata; 3, Franciscea calycina; 4, Strelitzia regina.

A. R. R., St. Ives: 1, Crocus Sieberi; 2, Cypripedium longifolium; 3, Cœlogyne cristata; 4, Leucadendron argenteum; 5, Rhododendron dauricum.

CLAY'S MANURES, CRUSHED BONES
(See back page.)

CLAY'S FERTILIZER is
UNSURPASSED for all Horticultural Purposes.
CLAY and SON, Stratford, E.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popula[illegible]han ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

"Since the days of the admirable botanical dictionary of Paxton, we have not seen a book which contains more information in as little space as this publication."—*The Lancet.*

THE NEW EDITION
...OF THE...
ENCYCLOPÆDIA OF GARDENING.

By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

THOROUGHLY REVISED AND BROUGHT UP TO DATE.

The New Features comprise:

1. **Entirely new type.**
2. **New binding.**
3. **The inclusion of the species and hybrids in general cultivation, with description of their respective colours, height, time of flowering, native country, etc. This is a most valuable addition.**
4. **The breaking up of the solid nature of the text so as to make each cultural feature distinct.**
5. **The cultural notes have been considerably added to, especially those relating to vegetables and fruit and market culture.**
6. **The nomenclature of the genera has been thoroughly revised and brought up-to-date.**
7. **The cultural details are now given under the generic name only.**
8. **All the common names in general use have been included in alphabetical order.**
9. **There is no dictionary in existence which gives so much information on gardening in so small a space and for so little money.**
10. **It conveys in a nutshell all that the busy man requires to know about the cultivation and nature of any flower, fruit, vegetable, plant, tree, or shrub.**

482 pages, bound in cloth. Price 3/6 net, from Booksellers; or by post, in box, 3/10, from

W. H and L. COLLINGRIDGE, 148 and 149, Aldersgate Street, London, E.C.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Observation.

It is a remarkable thing, considering the two wonderful gifts we possess of seeing and hearing, that so little practical use is made of them by the majority of human beings, as compared, that is, with the use which might be made. We may obtain a pretty good proof of this if we are the happy owners of a garden which is frequently visited by friends, ladies and gentlemen. Except in such cases where the visitors are specially invited as recognised flower lovers and students, the majority will simply ramble about, conversing on extraneous social or political matters, some of the young ladies will ejaculate "How pretty," in the intervals of their gossip about "him," and the fashions; and in short, the innumerable wonders of Nature, which teem in every garden worthy the name, will be entirely ignored and unobserved. Probably if asked on their departure, in a casual tone, whether they had seen everything in the garden, the reply would be a cheery, "Oh, yes! it's very nice indeed," although, if cross-examined, it would transpire that they had really seen nothing at all in the sense of seeing and appreciating properly. The power of observation is, in point of fact, rare, and its possession involves a freemasonry of incalculable social value when natural study is the incentive. Every true gardener knows what a delight it is to anticipate and receive a visitor of the keenly observant kind, who can fully appreciate the merits of what he sees, and be very probably in a position to impart some fresh knowledge in the desired direction. There is no superficiality here, no "How pretty" and "How nice" distributed broadcast, but a close study of points pro and con, and an eventual verdict which, if favourable, constitutes in itself a reward for much previous study and trouble. In point of fact the measure of cultural success in horticulture is determined entirely, given of course fair facilities, by observation of results and intelligent adoption of the lessons they teach. Every failure has its underlying reason, and hence, like the successes, constitutes a stepping stone to further knowledge, if only the grower is determined to get at the bottom of it, and does not merely accept it as a misfortune, and let it go at that. Observation, however, should be accompanied by notes and records, and not merely committed to memory, since it is often by comparison of such records with other and subsequent ones that the true meaning of the phenomena observed becomes apparent, and something tangible is then elicited. The man who makes no notes may, by virtue of a retentive memory, acquire a great deal of useful knowledge in the course of his existence, but he is little likely to be a contributor to that mass of knowledge which forms the literature of horticulture, and through which man learns from man, and as a notemaker adds his quota to that accumulation of ascertained facts, by virtue of which each generation becomes wiser than its predecessor. That great factor in horticultural progress, the Horticultural Press, is the practical outcome of powers of keen observation, coupled with careful recording, and we have only to contrast that Press of to-day with that of less than a century ago, to see what an immense advance has been made, and is always being made in the acquisition of invaluable practical knowledge. In the old days, say of Gerard, to go back still farther, the general ignorance permitted the authoritative promulgation of the most ridiculous myths and fables, and although in the outside Press of to-day we still, from time to time, find examples of horticultural and botanical marvels of equally grotesque character put forward with all verisimilitude, knowledge is now so widespread that it is rare, indeed, that anyone is taken in by them. Superficial observation is no good at all, it is the man who is always about and closely examining the plants he cultivates who hits upon the "reason why," both of success and failure, and by experiment based upon such discoveries eventually enriches not merely himself, but his fellows, with additional items of knowledge. This close research begins in the laboratory of the botanist, who pokes and pries with his microscope into the abstruse mysteries of the fundamental cell formation, and it ends with the selective cultivator, who, by close study of the plant as a whole and its peculiarities, adds so much to our floral and agricultural wealth, as exemplified in our up-to-date exhibitions.

MR. WILLIAM CRUMP, V.M.H.

Mr. William Crump, V.M.H.

Few men are more widely known in horticultural circles than Mr. William Crump, head gardener to Earl Beauchamp, at Madresfield Court, whose portrait we present in this issue. His first charge was at Lamberhurst, and from thence he went to Blenheim Palace, where he became particularly successful as a fruit grower, twice winning the packing prize of £10, offered by Mr. J. Webber, of Covent Garden, for the best three boxes of fruit sent by ordinary railway carriage, and delivered at South Kensington by the conveying company. From the Royal Horticultural Society and the Royal Botanic Society, Mr. Crump won gold medals for fruit while at Blenheim, and secured the blue riband of the old International Potato Society at the Crystal Palace. At Blenheim he raised the fine Blenheim Orange melon, and obtained a first class certificate for it at South Kensington, as well as first prize against thirty-one other entries. Rather more than a quarter of a century ago Mr. Crump took charge of the Madresfield Court Gardens, after the death of Mr. W. Cox, and ever since then his name has been intimately associated with the Madresfield estate as well as the gardens. The latter have been largely extended and greatly improved under his care, the massing of hardy flowering trees and shrubs, the bold grouping of herbaceous plants, and the naturalisation of bulbs in grass being a few of the innovations that have made Madresfield famous. But, as Mr. Crump is a famous fruit grower, it was only natural that he should develop hardy fruit culture at Madresfield, and this, with the generous support of his enthusiastic employer, he has done in a remarkable way. He has an experimental orchard, where all likely varieties of hardy fruits are tested, and all those that prove their worth are propagated extensively and distributed from the home nursery to the farmers, cottagers, and others on the various estates belonging to Earl Beauchamp. Mr. Crump has distributed in this way over 40,000 trees, thereby adding largely to the letting value of the property and the well-being of tenants. Mr. Crump is an old member of the Royal Horticultural Society's Fruit and Vegetable Committee, and he was one of the original recipients of the Victoria Medal of Honour in Horticulture.

Water Gardening will receive special attention in our issue of the 24th inst., and, with a view to afford our readers the fullest possible information on the work that must be done in the water garden during the next few weeks, the contents will include articles on formal and informal water gardens, water lilies, planting water margins, hardy aquatics other than nymphæas, and spiræas in the bog garden. The issue will be freely illustrated.

Fruits of Foreign Growth were less plentiful in British markets in March last than they were in the corresponding month of 1908, the aggregate decrease in value amounting to the substantial sum of £47,845. The increases and decreases were equal in number, and the more important of the former were those of nuts and oranges. As in the case of the first two months of the year, there was a big drop in the imports of apples, the aggregate having been 201,716 cwt., of the value of £129,888, as compared with 357,484 cwt., of the value of £208,401, in the corresponding month of last year. Apricots and peaches were, on the other hand, imported in larger quantities, the total imports amounting to 230 cwt., of the value of £1,547, or an increase in quantity of 168 cwt., and in value of £1,390. Of bananas the imports were 449,625 bunches, of the value of £127,959, or a decrease in number of 80,482 bunches, and in value of £13,180. Grapes were received in lessened quantities, the aggregate having been 3,213 cwt., of the value of £15,052, against 5,584 cwt., of the value of £24,138. The imports of pears were larger than they have been for several years, the total having been 2,898 cwt., of the value of £11,730, or an increase in quantity of 1,064 cwt., and in value of £6,785. The imports of plums aggregated 595 cwt., of the value of £2,831, as compared with 198 cwt., of the value of £429. Strawberries, of which a few were imported in the corresponding month of last year, have no place in the March returns. Of unenumerated fruits, the imports were 8,724 cwt., of the value of £12,674, the figures representing an increase both in quantity and in value of nearly 100 per cent. The value of the fruit imports for the month was £818,403, bringing the total value for the first quarter of the year up to £2,380,615.

Orchids at the Temple Show.—An important notice has been issued by the Royal Horticultural Society concerning the orchid classes at the forthcoming Temple Show. It appears that attention has been drawn to the possibility of misunderstanding arising from the use of the word, "unrestricted" in Classes 1, A. and B. It cannot, therefore, be too clearly and fully understood that the word is governed by Rule 4, which gives 200 square feet as the maximum. In other words, Classes 1, A. and B., are unrestricted in size only so long as they do not exceed the 200 square feet permitted by the rule.

A New Primula—P. Forresti.—We understand that at the meeting of the Royal Horticultural Society on April 20, Messrs. Bees', Lim., of Liverpool, will show a new Chinese primula. The newcomer owes its name—P. Forresti—to the fact that it was secured by Messrs. Bees' intrepid collector, Mr. George Forrest. Our readers will remember that on one of Mr. Forrest's collecting expeditions, he was hunted among the mountains by a band of insurrectionary Lamas, who murdered the French missionaries with whom he had been staying. Mr. Forrest escaped, but was eight days barefooted among the mountains, and during this period he touched no food. Primula Forresti is a native of limestone cliffs among the Yunnan Alps, at an altitude of 9,000-11,000 feet. It has been kept unprotected during the past winter at Sealand, near Chester, and has proved quite hardy. The leaves are strong and of a dark shining green. The flower spikes are from 10-12 inches high, carrying loose spreading heads of from 10-15 blooms. The individual plants vary in colour from light yellow to a fine rich orange. Perhaps the most notable feature, however, is the fragrance, which is quite unlike that of any other primula. It is not confined to the flowers, but is also present in the leaves, and is deliciously suggestive of ripe fruit. The whole effect of the plant is sturdy and vigorous, very different from the delicate beauty of the firm's previous introduction, the graceful P. malacoides.

Imports of Foreign Vegetables last month were much smaller than in March, 1908, the most noteworthy decrease being in potatoes. Of these tubers the imports were 85,017 cwt., of the value of £35,648, against 666,727 cwt., of the value of £129,625. The imports of onions amounted to 450,495 bushels, of the value of £110,165, these figures representing a decrease in quantity of 108,830 bushels, and an increase in value of £16,246. The imports of tomatoes dropped from 86,928 cwt., of the value of £69,722, in March, 1908, to 66,249 cwt., of the value of £51,712 last month. Unenumerated fruits, on the other hand, show an increase in value of £21,970, the total having been £59,700.

The Easter Holidays, although marred by the break in the weather, which occurred on Monday, were held under favourable climatic conditions, and there was a large exodus from London and the principal provincial towns to the country and the seaside during the week previous. Residents in London and its suburbs who remained at home, were careful to take full advantage of the opportunity they had for visiting the public parks and gardens within the Metropolitan area or not far distant from London. Enormous numbers visited such popular resorts as Epping Forest, Hampstead Heath, Hampton Court, and the Royal Gardens, Kew. According to the official return, there were 41,000 visitors to Kew on Easter Monday, against 56,000 last year. To the heavy rains which fell from noon onwards may be attributed the decrease, for the visitors came in such large numbers in the forenoon as to suggest a record attendance for Easter Monday. The daffodils on the Cumberland mound are now producing a glorious display of colour, and in other parts of the gardens these flowers are making such rapid progress as to suggest that the later varieties in other parts of the gardens will be equally attractive within the next few days.

The Journal of the Kew Guild for 1908 has just reached us, and, though it is dated for Christmas, and comes with the daffodils, it is not less interesting because belated. The frontispiece is an excellent portrait of Mr. George Massee, F.L.S., V.M.H., and is followed by a biographical sketch of this famous cryptogamist. The annual report and accounts show that the Guild's balance on current account almost doubled itself during the year, and consists of £20 9s. 2d. in cash. In addition, there are invested funds to the total of £320, yielding a trifle less than £10 10s. per annum. Old Kewites will read with interest of the doings of the "Kew Mutual," and the results of the courses of lectures, and will think of the days of the years that are gone. "The Kew Training" is an article that should make present Kewites think hard. We fear that an objection by students to be regarded as such, and an endeavour to belittle the educational advantages of a sojourn at Kew, on the part of Kewites of recent years, is answerable for some measure of reduction in appointments from Kew. Mr. F. J. Cole's plea for an Institute of Gardeners is particularly good, and the idea will appeal to many who desire to see the profession placed on a higher level. The "Notes from Old Kewites" are numerous and entertaining, but there is a lack of descriptive accounts of travels this year.

The Lasting Qualities of Dahlia Flowers.—A Fellow of the Royal Horticultural Society, writing from Wiesbaden, draws attention to a point of considerable interest in connection with dahlias. He found that some varieties would, on being cut for decorative purposes, last much longer than others kept under the same conditions. Herr E Becker, also of Wiesbaden, states that he finds those varieties with narrower foliage possess more lasting qualities than those with broad flat leaves. He considers that plants which have been heavily manured with stable manure are less lasting than those which have been grown without its aid, and finds that if the foliage be removed immediately after the flowers have been cut, they last much better in water than they do in the ordinary way. The matter is one well worthy the attention of growers and raisers of these brilliant decorative flowers, and observations upon the subject would be welcomed.

A South African Bamboo.—For more than seventy years the existence of a bamboo in Cape Colony has been known, but until last year the inflorescence of the species was unknown. It appears that Munro was correct in referring the species to arundinaria, and his name of A. tessellata has been retained. Commandant Bowker wrote, in 1877, that, "The bamboos are much used by the natives for spear handles, house building, fences, and gates to sheep folds, etc. They can be got from 3 feet to 25 feet in length, and in any quantity. I have used a rod made from it for many years past, and found it superior in spring and strength to any other I could get. I think they could be turned to account as coach-whip handles, umbrellas handles, walking sticks, etc.; the root grows into almost every shape, and could be cut into handles of different patterns." Nothing more was heard about the use or usefulness of the bamboo; but, says Dr. Stapf, in the "Kew Bulletin," it seems quite worth while to try again whether it could not be put to any practical use, the more so as one of its principal stations, the one near the Van Reenen Pass, in the Drakensbergen, is now easily accessible by railway. At the same time, an attempt should be made to take it into cultivation. It ought to prove hardy in this country. The area of Arundinaria tessellata lies from Stockenstrom and Queenstown Divisions over Craddock, Tarka, Molteno, Aliwal North, and Basutoland, to the Drakensbergen, the easternmost station in that range being at the Van Reenen's Pass. It may be pointed out in this connection that Munro in putting the lower limit of Arundinaria tessellata at 500 feet merely repeated a mistake or misprint in Nees's account of the bamboo, where it is said to occur on Katberg at 500 feet, instead of 5,000 feet.

The Magpie in London.—With reference to the nesting of the magpie in London, Mr. W. Cave writes: "It may be of interest to your readers to know that a pair of magpies are now building a nest in the Green Park. I watched the male bird on several occasions this winter, evidently prospecting in the same tree where the pair have now begun operations. This poplar tree is within 30 yards of Piccadilly, and on the banks of the Tyburn brook which still runs underground, crossing the street between the Savile and St. James's Clubs. The existence of magpies in St. James's Park is probably well known to many, but I do not think their nesting in London has yet been recorded."

Horticultural Club.—The next house dinner of the club will take place on Tuesday next at the Hotel Windsor, when Mr. E. A. Bunyard will give a lecture on "The Colours of Plants." The dinner will, as usual, commence at 6 p.m.

Davidia involucrata.—Mr. A. S. Horne, in a paper read before the Linnean Society, deals with the structure and affinities of the genus Davidia, which has been referred to the natural orders Combretaceæ, Cornaceæ, and Hamamelidaceæ by various authorities. In the light of original observations carried out under the direction of Professor J. B. Farmer, upon material brought by Mr. E. H. Wilson from Szechuen in 1904, evidence is advanced in favour of interpreting the inflorescence as consisting of a number of congenitally fused, apetalous, multi-staminate male flowers, or of male and in addition a single obliquely situated, apetalous, hermaphrodite flower with epigynous stamens arranged in series. From a detailed study of the flower, ovary, ovule, and seed, the author is inclined to believe that Davidia is distantly related to Alangium and Nyssa, and still more distantly related to the Araliaceæ; that the genus occupies a somewhat isolated position owing to having pursued an independent course of development from the plexus of primitive groups, which included the ancestral forms of the Araliaceæ, Nysseæ, and Alangieæ.

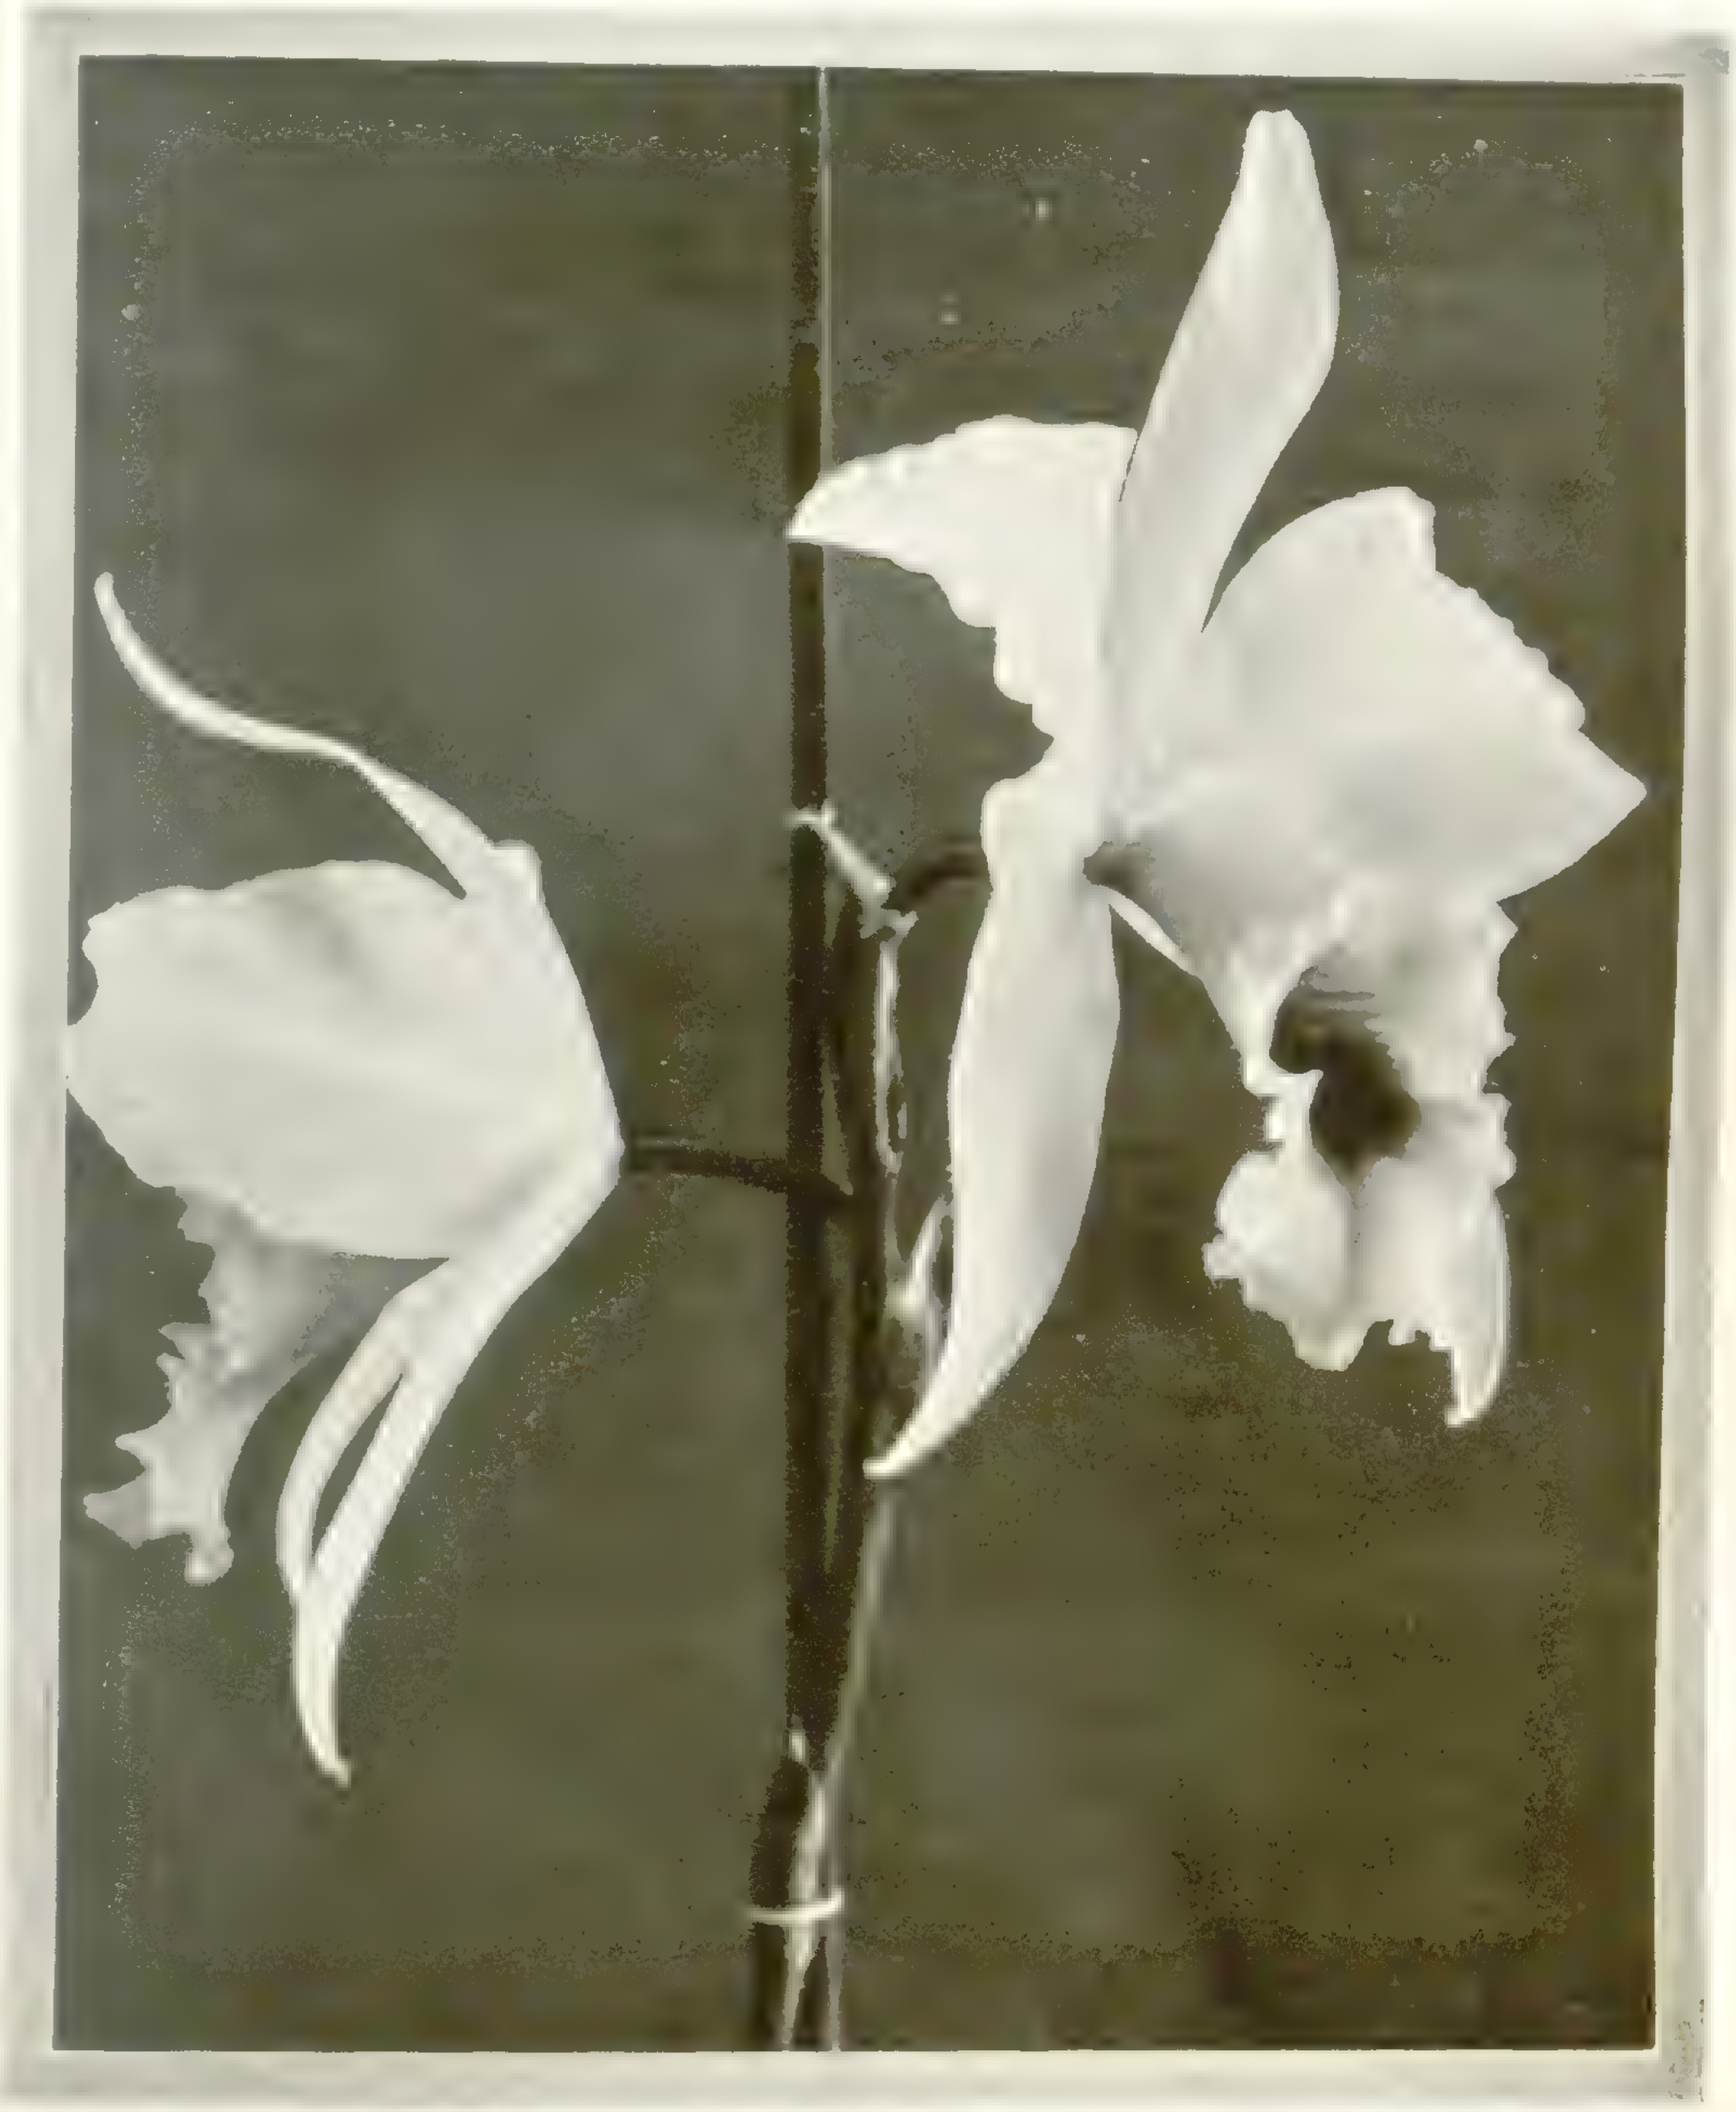
EARLY RHODODENDRONS AT LEONARDSLEE.

The fine Rhododendron barbatum is now in flower here, though it is much later than usual. There is a great charm about this rhododendron, as it is one of the brightest and earliest, but one needs a really large plant to see it at its best. It is fairly easy to grow, provided a suitable position is found for it with a little shelter from cutting winds, a little shade from hot sunshine in summer, and a moderately high position. R. præcox is now very effective and bright. This is a hybrid between R. dahuricum and R. ciliatum, and it is a better grower than its seed parent, as it makes fairly good bushes in a short time, and is an exceptionally free bloomer. It should be grown in groups of half a dozen or more plants when its effect is very fine.

R. dahuricum is also in flower; this is a slim and rather ragged grower, but gives delightful blooms, with a sweet fragrance in both foliage and flower. This also looks best when planted in groups. R. ciliatum is fast opening its buds (April 6), and promises to be extra fine, and by the time these lines appear, I expect, will be in full bloom. This is the gem among the earlier species; it is of good habit, compact and shapely, flowers with the greatest freedom, and has only one drawback, i.e., it may be nipped by frost. But there is always a certain amount of risk with every early plant, and this is one that most certainly should be planted. One cannot have too many of it. I recollect last March seeing what I believe to be the finest existing batch, at Tremough, in Cornwall, and I think, if I remember aright, that Mr. Gill lifted one and sent it to the R.H.S. meeting last spring. We have a large quantity here, but not such large plants as those at Tremough. This charming species forces readily (not too early), and it makes a pleasing addition to forced subjects for house and conservatory, and the flowers when so produced are nearly white.

R. Nobleanum, when a finely-developed specimen, makes a brave show, and it flowers from Christmas to Easter. A good dressing of cow manure over the roots during the summer enables the plants to make fine growth and buds, keeps the foliage clean and healthy, and, moreover, keeps the roots cool, which is essential to their well-being. W. A. Cook.

Leonardslee Gardens, Horsham.



LÆLIO-CATTLEYA FREDERICK BOYLE VAR. KERCHOVÆ.
Flowers blush, with yellow throat. A.M., R.H.S., April 6. Sir Trevor Lawrence, Bart., Dorking.

Caltha palustris flore plena.—There exists no better plant for an effective and cheap display in spring in any boggy position than the double form of Caltha palustris. The foreground planted with this subject, and backed by the innumerable forms of double trollius, will yield a rich harmony of colour, and impress every beholder with the latent possibilities that underlie this branch of gardening, as it is only by a free use of bog and water that we need expect that full development from those plants which naturally inhabit swampy regions.—Thomas Smith.

NEW PLANTS, ETC.

ODONTOGLOSSUM PERCULTUM COOKSON'S VAR.

This is a very fine variety, the flowers being of splendid shape and good size; the colour is mauve-purple, with white margins, and a few white veins. O. percultum is the result of crossing O. Rolfeæ with O. ardentissimum. F.C.C., R.H.S., April 6. Mr. H. J. Chapman, gardener to N. C. Cookson, Esq., Oakwood, Wylam-on-Tyne.

ODONTIODA ERNEST HENRY.

In this distinct novelty the deep, dark red-brown, with a rich golden crest, is very striking, but not particularly beautiful. The flowers and plant shown were small, so that the former may be expected to improve in the course of a season or two. The parents were O. Queen Alexandra and Cochlioda Noezliana. F.C.C., R.H.S., April 6. Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney.

CATTLEYA SCHRODERÆ THE BARON.

This magnificent variety gained a certificate previously, but the award did not hold good, as a painting was not made. The broad petals and sepals are pale blush, white towards the margin, and deepening towards the large, soft orange disc in the lip. A beautiful orchid. F.C.C., R.H.S., April 6. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester.

CATTLEYA SCHRODERÆ IRENE.

Another charming variety with pale lilac-pink flowers, and a rich yellow disc. The flowers are very large, and the lip prettily frilled. F.C.C., R.H.S., April 6. Mr. A. W. Jensen, Lindfield, Haywards Heath.

CATTLEYA SCHRODERÆ ALEXANDRA JAMES.

A large-flowered variety, blush tinted, with large orange disc on the lip. Fine in form and substance. A.M., R.H.S., April 6. Mr. Wm. James, West Dean Park, Chichester.

LÆLIO-CATTLEYA FREDERICK BOYLE VAR. KERCHOVÆ.

A very pretty variety of this L. anceps hybrid. It has fair-sized, blush-coloured flowers with golden throat to the lip. A.M., R.H.S., April 6. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

ODONTOGLOSSUM CRISPUM ANGELA.

A beautiful variety, broad-petalled, and of good form. The flowers are white, freely marked with deep crimson. A.M., R.H.S., April 6. N. C. Cookson, Esq.

ODONTOGLOSSUM SYLVIA WESTONBIRT VAR.

This is a pretty form of the elegant hybrid derived from O. cirrhosum and O. Rolfeæ. The flowers are starry, yellow, with dark brown markings, and borne on a branched spike. A.M., R.H.S., April 6. Lieut-Colonel Holford.

ODONTOGLOSSUM DREADNOUGHT.

A handsome, large-flowered hybrid from O. Prince Albert and O. sceptrum. The principal colour is deep red-brown over yellow, the latter showing as veinings and at the tips. The lip is bright brown and yellow. A.M., R.H.S., April 6. Messrs. Sander and Sons, St. Albans.

RHUBARB DAWES' CHALLENGE.
A valuable variety shown by Mr. T. E. Dawes, Syderston, Norfolk, at R.H.S. Meeting, on April 6, when an Award of Merit was made in its favour.

HIPPEASTRUMS.

Magnificent.—A very beautiful variety with rich crimson colouring in the centre, this shading beautifully into the soft rose colour at the apices of the rounded segments. A fine form. A.M., R.H.S., April 6. Messrs. R. P. Ker and Sons, Aigburth, Liverpool.

Marcus.—A splendidly formed flower, round, and with broad segments. The colour is rich vivid crimson. A.M., R.H.S., April 6. Messrs. Jas. Veitch and Sons, Chelsea.

SAXIFRAGA APICULATA ALBA.

This is a very pretty addition to our early-flowering saxifrages, but the flowers are not truly white. They are very pale cream colour, and produced freely on the dwarf, sturdy spikes. A.M., R.H.S., April 6. The Guildford Hardy Plant Nursery, Guildford.

DAWES' CHALLENGE RHUBARB.

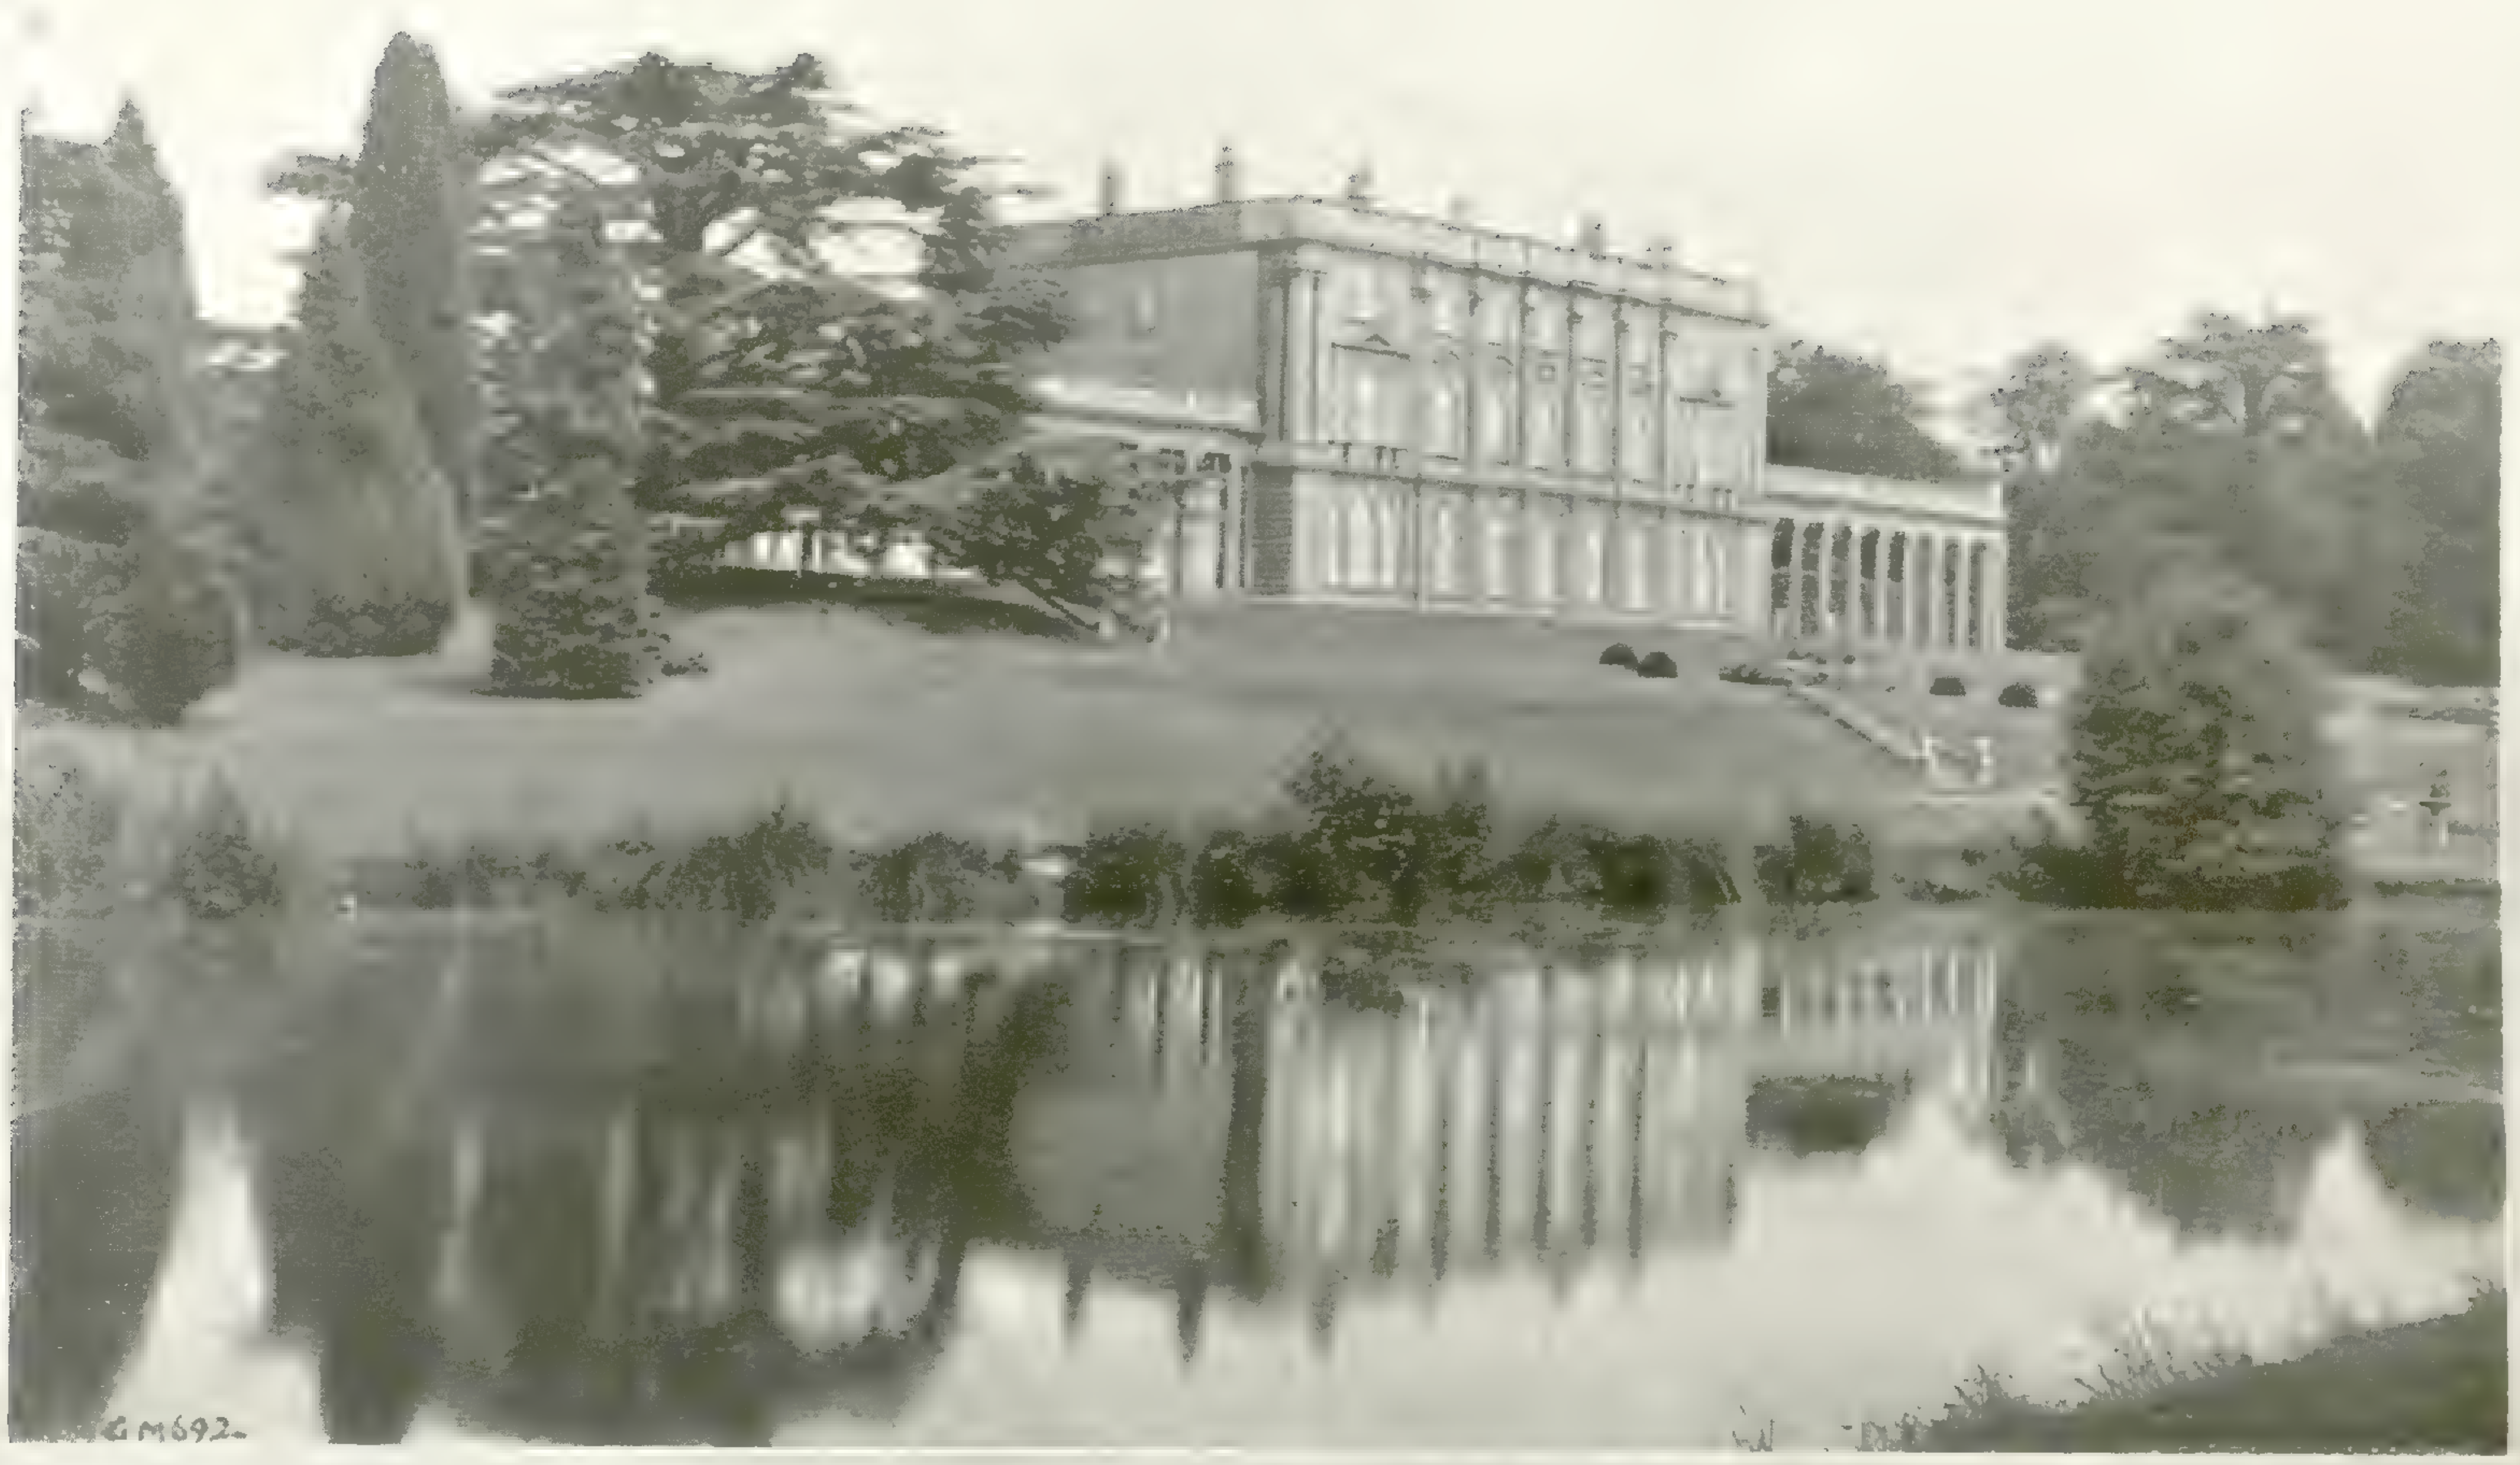
A splendid variety, producing an abundance of long succulent stems of brilliant colour. Very prolific, and fine for forcing. A.M., R.H.S., April 6. Mr. T. E. Dawes, Syderstone, King's Lynn, Norfolk.

TOWN GARDENING.

I must ask your indulgence in order to reply to Mr. Kingsmill, of Harrow Weald. I thought I had made it quite clear in my notes that it is impossible to treat this subject in a general way, because what would thrive at Highgate would be a complete failure in Bermondsey. I have spent a long term in public work, and under a variety of conditions, and am at a loss to know in which of our Metropolitan parks Mr. Kingsmill drew up his list of over a hundred trees that actually succeed. It is a mistake to take a walk round Waterlow or Dulwich Parks, which, from a gardener's point of view, are practically in the country, to make note of the trees that appear happy and prosperous, and to declare that they are admirably adapted for London parks generally. When I was writing of the difficulty to cultivate successfully, etc., reference was made to the unfavourable circumstances over which no gardener, however able and competent he may be, has any control.

It would be interesting to obtain a report from the various superintendents, not only in London, but the provincial towns, on the subject, and I am quite aware that experiments are made in our parks with plants generally, and a given tree may present a fairly good appearance for a year or two, but deterioration sets in very early. This induces me to say that I do not accept every subject that has a label attached to it and is alive as a proof of it being happy and doing well, and in speaking of vegetation generally, and its adaptability to unfavourable conditions, it behoves Mr. Kingsmill and everybody concerned to make perfectly sure of their ground before making a definite statement. Walter H. Aggett.

Water Tanks and Ponds employed for the cultivation of aquatic plants in summer should be examined at the earliest opportunity, removing any scum or objectionable matter that has collected either on the surface or at the bottom. If practicable, draw off the bulk of the water; this will enable the workmen to more thoroughly examine the plants, and also to augment or reduce the various occupants as desired. Water lilies occasionally develop [illegible] crowns, which only produce a dense growth of small leaves, and rarely any flowers; such crowns should be entirely removed, and crowns of normal growth in place of those removed. Many of the free-growing varieties require severe thinning, as overcrowding has a tendency to raise the majority of the leaves out of the water, thereby lessening their decorative [illegible] in flower. Fresh soil should only be employed under special circumstances, as the majority of aquatics succeed best in the natural mud which collects and is deposited in still water.—Thomas Smith.



CAVERSHAM PARK.

SOME GARDENS ROUND READING—II.

Caversham Park.

Prominent among the many notable seats in the district of which Reading is the centre is Caversham Park, the residence of W. T. Crawshay, Esq., which has long been famous for the commanding position of the stately mansion, and for the extent and interest of its gardens. Situate on the Oxfordshire, or north side of the Thames, the mansion and gardens are between two and three miles from Reading Market Place, and are reached by way of Caversham Bridge and village, both of which possess considerable interest. The bridge is associated with some of the more stirring events in history, and the village, as becomes the suburb of a flourishing town, has an extremely well-to-do look about it, and enjoys considerable favour for residential purposes. The village is not wanting in picturesque effect or trim gardens, and the road thence to the mansion has much to attract the attention of, and give pleasure to, lovers of characteristic English scenery. The rolling meadows and wide stretches of woodland that meet the eye during the climb from the village to the high ground on which the mansion stands, form a series of delightful pictures, and come as a pleasant relief to the flat country the traveller finds in approaching Reading from the London side.

The descending approach to the mansion from the high road is particularly good, and the grandeur and beauty of its site are so remarkable that they appear to have made a profound impression upon Whateley, for he refers to them in eulogistic terms in his classic work entitled "Some Observations on Modern English Gardens." The illustration given herewith will convey some idea of the dignity of expression of the structure, flanked by noble trees of mature growth, and commanding a wide stretch of country in one of the fairest parts of this England of ours. Along the front of the mansion is a broad terrace, about two hundred yards in length, with spacious flower beds and walks of a width proportionate to so ample a space. From the terrace the prospect is extensive, and includes the broad and richly diversified valley of the Thames. At the west end of the mansion are numerous coniferous trees, in which a noble Cedar of Lebanon is conspicuous, and at the east end are coniferous and deciduous trees, and of these the finely developed cedar is the most noteworthy. At the foot of the principal slope is the commencement of the lake, which is seen in the illustration, and this fine expanse of water rapidly widens, and, extending between two fine belts of deciduous trees, greatly enhances the charms of the garden. The edges of the water, it must be said, are separated from the trees by breadths of turf, and on one of the margins are bold masses of pampas grass, polygonums, and other suitable subjects. The grounds of Caversham Park were originally laid out by "Capability" Browne, who enjoyed a high degree of popularity as a landscape gardener in the second half of the 18th century, and they were altered considerably about thirty years ago.

On the west side of the mansion is a spacious conservatory, built in agreement with the architecture thereof, but evidently free from the defects characteristic of many architectural plant houses. At all events, it is richly furnished with choice plants in the best possible condition. The building is divided into two sections, and that adjoining the mansion is devoted to greenhouse plants, and, taking advantage of the tall pillars on either side of the principal path, Mr. Miles, the head gardener, has given an excellent object-lesson on the value of fibrous-rooted begonias as conservatory climbers. From floor to the roof the elegant pillars are clothed with Begonia fuchsioides and other free-growing kinds, and the effect produced by their glistening leaves and attractively coloured pendulous flowers is extremely good. The second of the two divisions is occupied by tropical plants, that include a considerable number distinguished by their bold growth. Here also we find unquestionable evidence of cultural skill of a high order, and it would be interesting to enumerate some of the more noteworthy specimens, but one has necessarily to be brief.

At the east end of the mansion the architectural features are continued by means of a line of elegant pillars connected with a suitable cornice. The pillars form an admirable balance to the conservatory at the other end, and afford an opportunity for the provision of a flower garden in which shelter from strong winds and seclusion may be enjoyed. Looking across this garden from the door of the mansion that opens on to it, the effect, with the noble cedar as the background, is very pleasing. At the back of the enclosure is a lofty structure, in which tree and other ferns have found a home in every way adapted to their requirements, for they are all in the most robust state of health. The ferns alone would have formed a charming picture, but the effect has been materially enhanced by clothing the walls and the surface of the beds with Rex begonias, which are certainly not less luxuriant in their growth than are the ferns.

One might write at length on the distinctive features of the spacious pleasure grounds, of the delightful woodland walks, and of the many interesting trees met with, but the kitchen garden, with its numerous glasshouses and various cultures, form so strong a feature that some reference must be made to it. Intersecting the large area devoted to the production of fruits and vegetables, and the various classes of decorative plants that require the aid of glass in their cultivation, is a broad walk flanked by borders of dwarf roses, and enclosed by yew hedges six feet or so in height. This walk, with its borders of roses, and shut off from everything likely to offend the eye, must form a delightful promenade during the season of roses, which, by the way, is a long one, for continuity of flowering evidently received the fullest consideration when the border was planted.

It was interesting to observe in passing through the numerous houses set apart for ornamental plants, that those which yield of their floral wealth from the middle of the autumn until the spring are held in high appreciation for the embellishment of the mansion and table decoration. The popular Begonia Gloire de Lorraine, poinsettias, calanthes, and several other subjects that are well known are grown in immense numbers, as also are chrysanthemums in variety. The cultivation of Malmaison and other carnations is carried out on a large scale, and with much success. Planted out, and trained over the back of one of the houses, is a huge specimen of Streptosolen Jamesoni, that throughout the summer blooms abundantly and produces a rich effect. When the writer had the pleasure of seeing it the foliage was almost hidden by the large masses of bright orange-coloured flowers.

It follows, almost as a matter of course, that in so large an establishment Mr. Miles should devote three or four houses to the production of tomatoes, and it need only be said that the crops were such as might be expected from so skilful a cultivator. It was interesting to observe that the climbing French beans are grown largely under glass, and give heavy crops. The plants grown for the production of the later glass crops are planted in a narrow border and trained up strings, and give liberal supplies with much less trouble than when pots are used. The ranges of peach houses and vineries were not less interesting than were other structures, and much might be written about the splendid crops of Goshawk and Sea Eagle peaches, and grapes generally, but one can only now say that they produced an impression not likely to be soon removed.

ENCLOSED FLOWER GARDEN, CAVERSHAM PARK.

Maple-Durham House.

As in the case of Caversham Park, Maple-Durham House is situate on the north side of the Thames, and is rather more than three miles distant from Caversham Bridge, by which access from Reading is obtained into Oxfordshire. This fine old manor house, the residence of the Hon. A. H. Mills, has the advantage of being placed amid the most delightful surroundings, and of being approached, no matter from what direction the visitor comes, through scenery so beautiful that one might well be excused for speaking of it in glowing terms. The river scenery changes immediately above Caversham Bridge, and instead of the flat meadows through which the river flows on passing Reading on its way to the sea, the ground rises sharply on the north side of the road, and for a considerable distance the latter passes under deep, well-wooded banks, and elsewhere affords glimpses of scenery in which wood, water, and mead are so happily combined as to compel a deep admiration for Nature's handiwork.

Maple-Durham House dates back to the reign of Henry VIII., and is a fine example of the best architecture of the time, and one might well wish that it found favour at the present day. No edifice would well be better suited for the home of a great country family, combining as it does solidity with elegance, and having the advantage of being quiet in colouring, without any approach to dulness. The mansion has a façade of considerable length, with bold central porch, and two wings, details that are mentioned for the purpose of directing attention to the admirable manner in which the handsome Magnolia grandiflora is utilised in clothing some portion of the walls. The porch is covered with variegated ivy which grows vigorously, and, proper trimmed, produces an excellent effect contrast with the deep red, dark-pattern brick walls. Some distance on either side of the porch is a slight projection, abo six feet wide, and perfectly flat, and on these two projections the large-flowe magnolia is trained to a height of prob thirty feet. Not a branch is allowed extend beyond the sides of the project and the effect is surprisingly beautiful, asmuch as the fine lines of the build are in no way blotted out or blurred, the case in many instances when climb plants have as their supports the walls buildings of architectural or historical portance. At no distant date I sh my readers an opportunity of judging themselves how admirable is the syst training wall plants that has been adop in this case. I had intended giving illustration in conjunction with th notes, but it has not been found poss

Extending in a direct line from th

door, for a distance of a mile or so, is an avenue of elms. I am not in a position to say when the avenue was planted, but it must have been in the distant past, for the trees are of noble proportions, and there has long been current a tradition that when one of the trees is blown down a Blount dies. The Blount family, it may be added, has owned the property for about four centuries. Not always have the mansion and its surroundings presented the quiet appearance which now constitute so great a charm, for one has not to dip very deeply into historical records to be reminded that in 1443 the mansion was strongly fortified, and had to bear the brunt of a hot contest, and to suffer the indignity of being taken by the attacking force.

The pleasure grounds and flower garden are extensive, distinct in character, and possess much beauty. The former are especially rich in ornamental trees, and as one calls to mind the many remarkable specimens of choice kinds that have found such an excellent home, the inference suggests itself that the tree planting done by the Duke of Marlborough at Whiteknights Park had its influence upon the then owner of Maple-Durham House. Cedar and other coniferous trees, large in size, and splendidly developed, abound in all directions. Some indication of the wealth of the grounds in these trees is obtained in the illustration in which the shepherd standing on a tall pedestal is quietly surveying the scene. The central part of the mass of yew surrounding the pedestal is of the common kind, and the outer band is the golden variety, which here takes on a brilliant colour, and produces a contrast that is very effective amid the somewhat sombre hues that prevail. In this portion of the grounds note was made of an especially fine specimen of Pavia macrostachya, which here attains to an exceptionally large size, and blooms with remarkable profusion. Of special interest and immensely attractive is the tall and otherwise splendidly developed specimen of the Maidenhair Tree (Salisburia adiantifolia). Seldom are such fine examples of this elegant tree met with, and it may well be regarded as one of the most noteworthy arboreal features of a garden rich in beautiful trees. Worthy of mention also is a fine specimen of Cratægus odoratissimus, a handsome species remarkable for its large leaves, its handsome flower trusses, and for the late period at which it blooms. The flowers attain their full development about a fortnight after those of the varieties of the common thorn have lost their freshness and beauty, and are then much appreciated.

The flower garden, of which an illustration is given, adjoins the mansion, and enclosed on three sides by trim hedges of yew it forms a charming retreat. The method of planting for summer effect is sufficiently shown to render description unnecessary, but it should be mentioned that the photograph was taken rather too early to show the plants at their best. Elsewhere may be seen hardy plants in abundance, and in another part of the gardens climbing and other roses, which Mr. D. Harris, the gardener, grows with so much success, were producing a beautiful display of colour.

FORMAL FLOWER GARDEN, MAPLE-DURHAM HOUSE.

Hardwicke House.

Leaving the quaint little village of Maple-Durham, and continuing the journey in the direction of Pangbourne for a mile or so, the fine old Tudor mansion known as Hardwicke House is reached. The scenery between Caversham Bridge and Maple-Durham, as previously mentioned, is extremely beautiful, but after leaving the last-named the road passes through even more picturesque country, and the pleasure is enhanced by some charming glimpses of the river. The mansion, which dates back to the time of Richard II., has much that is of interest associated with it, and is remarkable for its handsome elevation, its distinctive gables, and elegant groups of chimneys. The ground here slopes sharply down to the river, and the mansion, placed on a terrace on the north side, commands a wide and beautiful prospect, the river contributing in no small degree to the great charm of the Thames valley, which is here of considerable width.

The grounds of Hardwicke House, which is the residence of Charles Rose, Esq., are extensive and highly picturesque, and, among other things, are remarkable for the large number of splendidly developed trees, for the fine breadths of turf that form so admirable a setting to the arrangements of tender plants, the spacious borders of hardy perennials, and the groups of roses. The tender plants are arranged in a geometric garden contiguous to the mansion, and as this is accomplished with much taste, the effect, as seen from the terrace, is very pleasing. On the western side of the lawn is a border of hardy perennials, that at once arrests attention by the high development to which the plants attain, and the delightful combinations of colour that are produced. The heavy rain would not permit of more than a hasty glance at this fine example of hardy plant culture, a matter much to be regretted, because the rain kept the camera in its case, and prevented me carrying out my intention of giving an illustration of a portion of the border and of some other objects. Hardy plants are grown in other parts of the grounds, a point of some importance, as they show that they are highly appreciated at Hardwicke House, and that the gardener, Mr. A. Ryder, is fully conversant with the finest of the kinds and their cultural requirements.

In the lower ground on the south side of the wide-spreading lawn is an extensive bog garden, which, formed a few years since, now constitutes a most attractive feature. The area is intersected by canals [illegible] feet or so in width, and in these the [illegible] beautiful of the aquatics may be seen in a thriving condition. On the margin of the water are various moisture-loving plants, and in the spaces between the canals are groups of grasses, polygonums, and other hardy plants of bold growth. The pleasure grounds are continued down to the river's bank, where a terrace, with a broad walk and beds tastefully embellished with flowering plants of various descriptions, form a feature at once distinct and beautiful.

The numerous fruit and plant houses are arranged on the slopes to the west of the pleasure grounds, and in them was seen much to interest, and abundant evidence of cultural skill of a high order. On the broad belt of ground at the foot of the slope that skirts a private road, rambling roses and sweet peas were yielding their wealth of floral beauty in prodigal profusion, and producing an effect that compelled attention, however the rain might be falling—and it certainly was not light. The roses were supported by pillars formed with larch poles, and fixed in a line next the road, and behind them were the masses of sweet peas, which had attained to a quite exceptional height, and were flowering freely from within a short distance of the ground to the top.

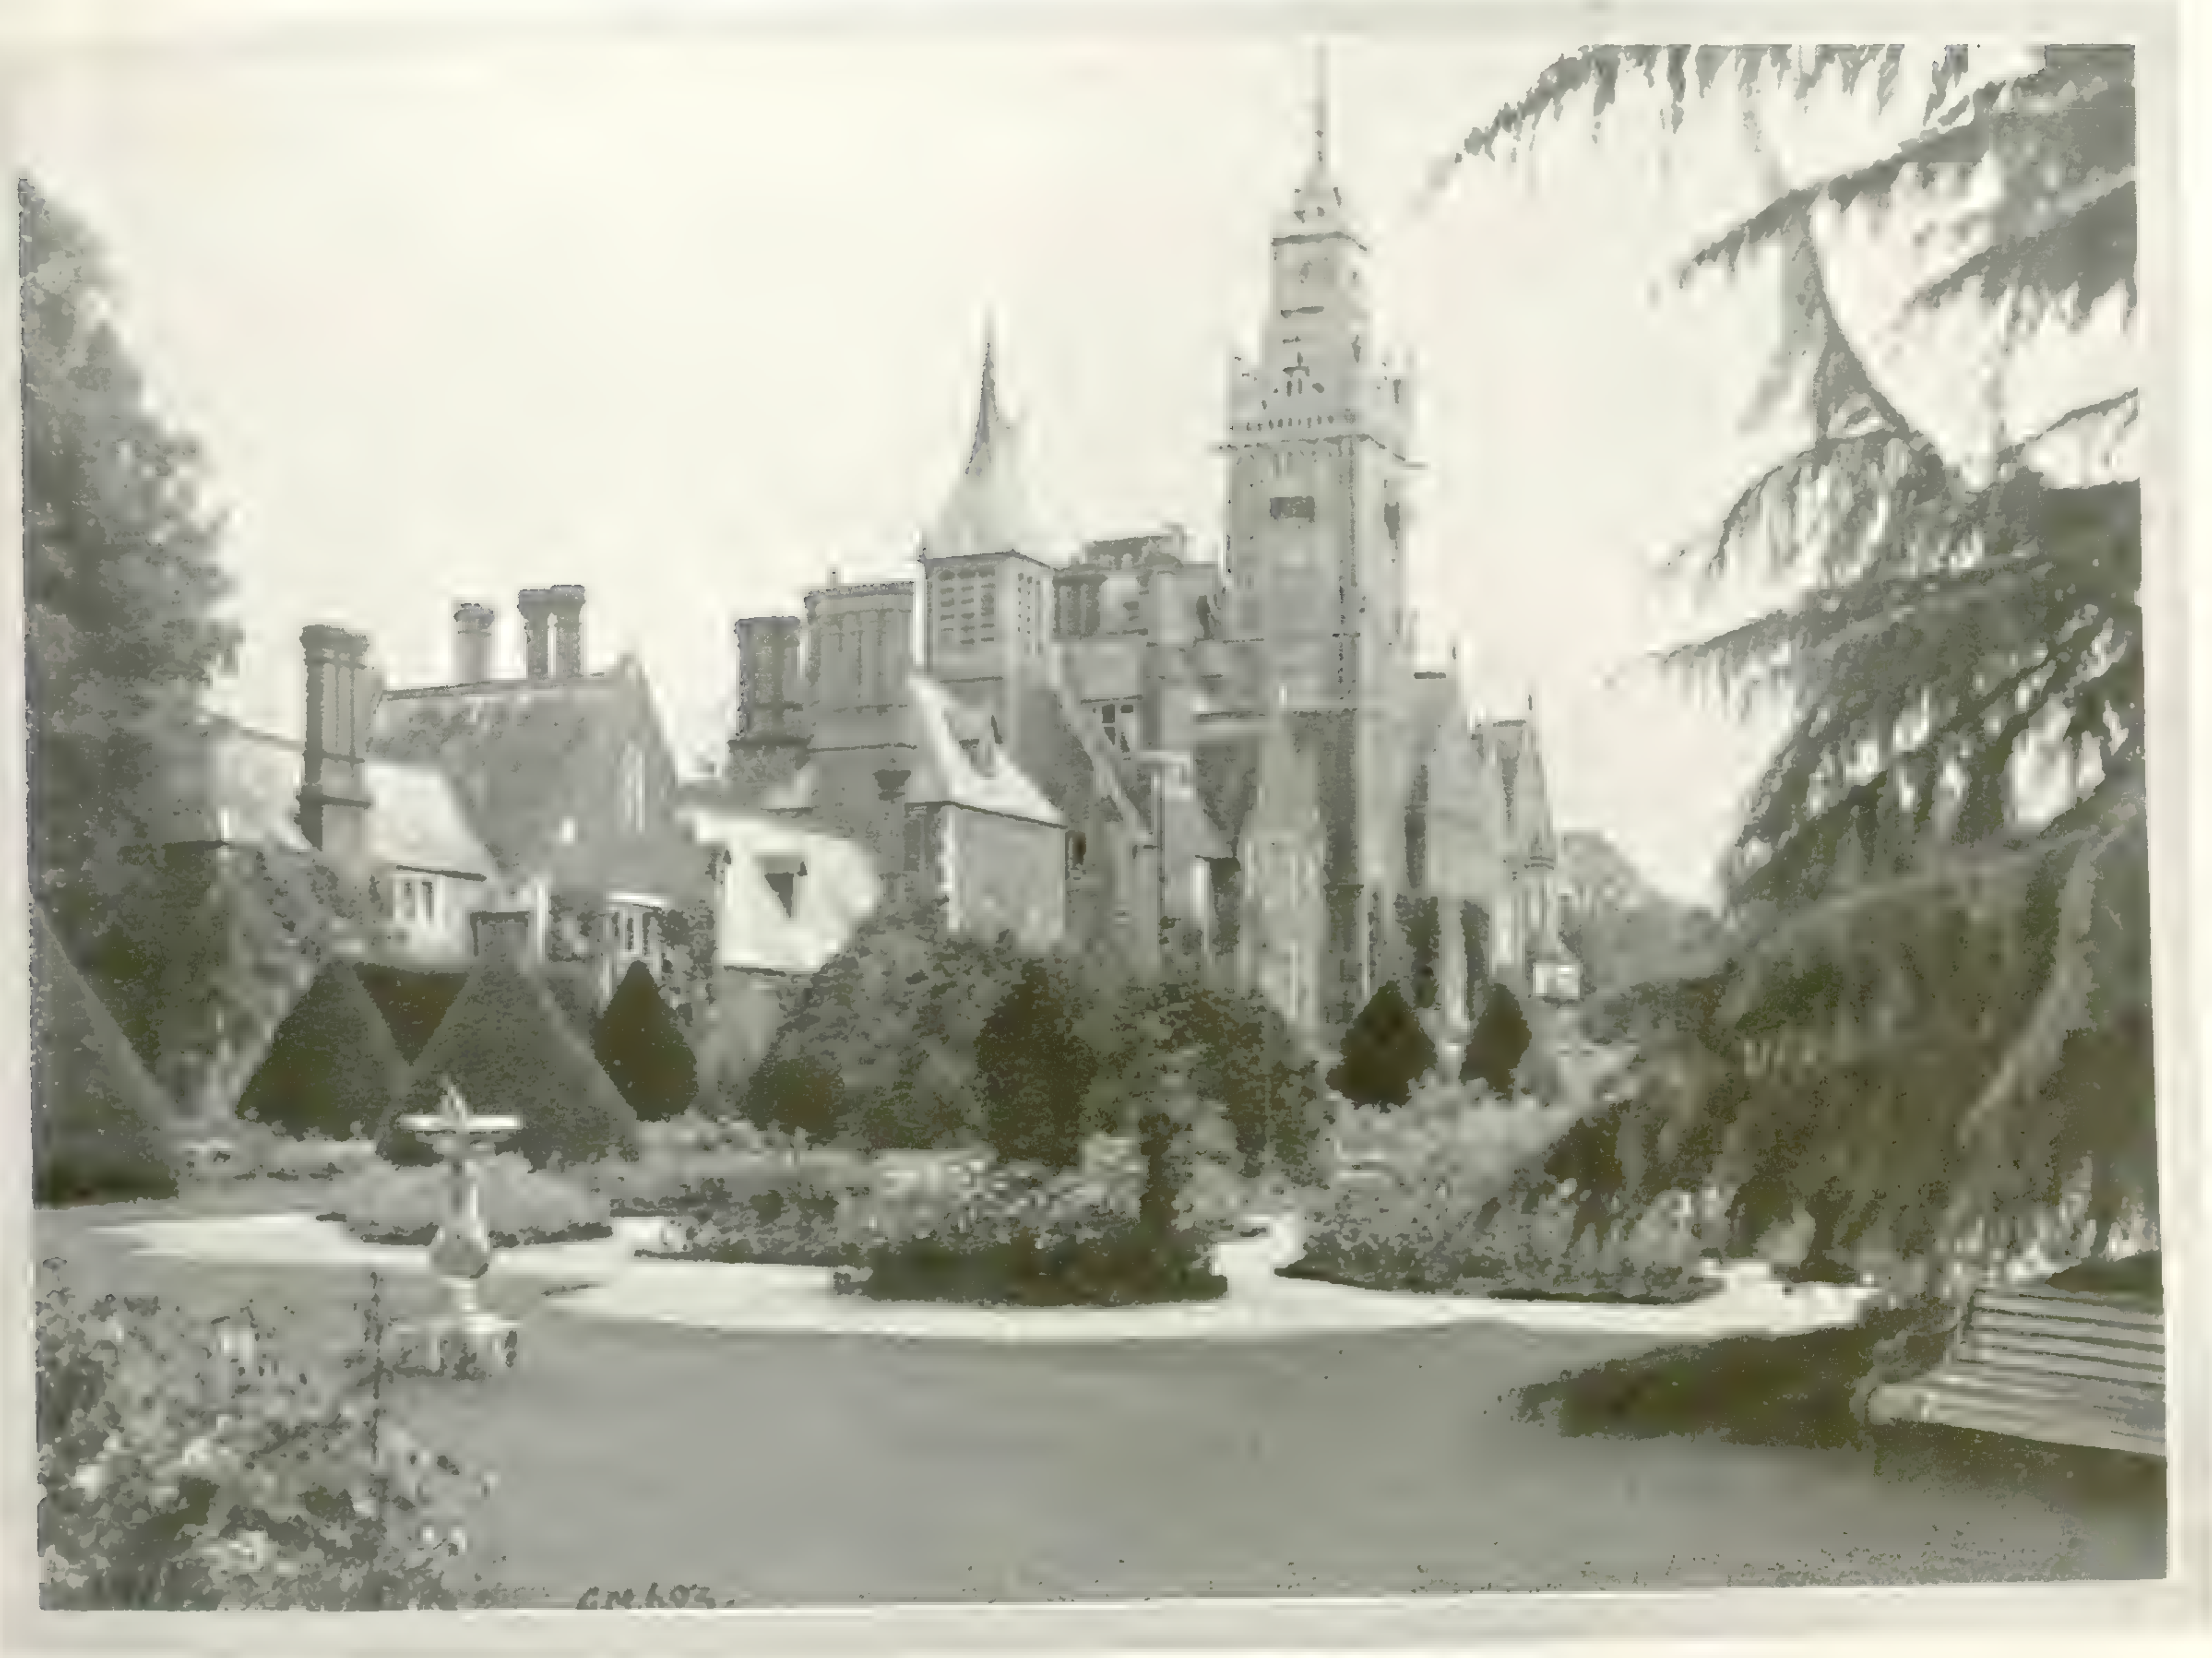
VIEW IN PLEASURE GROUNDS, MAPLE-DURHAM HOUSE.

Aldermaston Court.

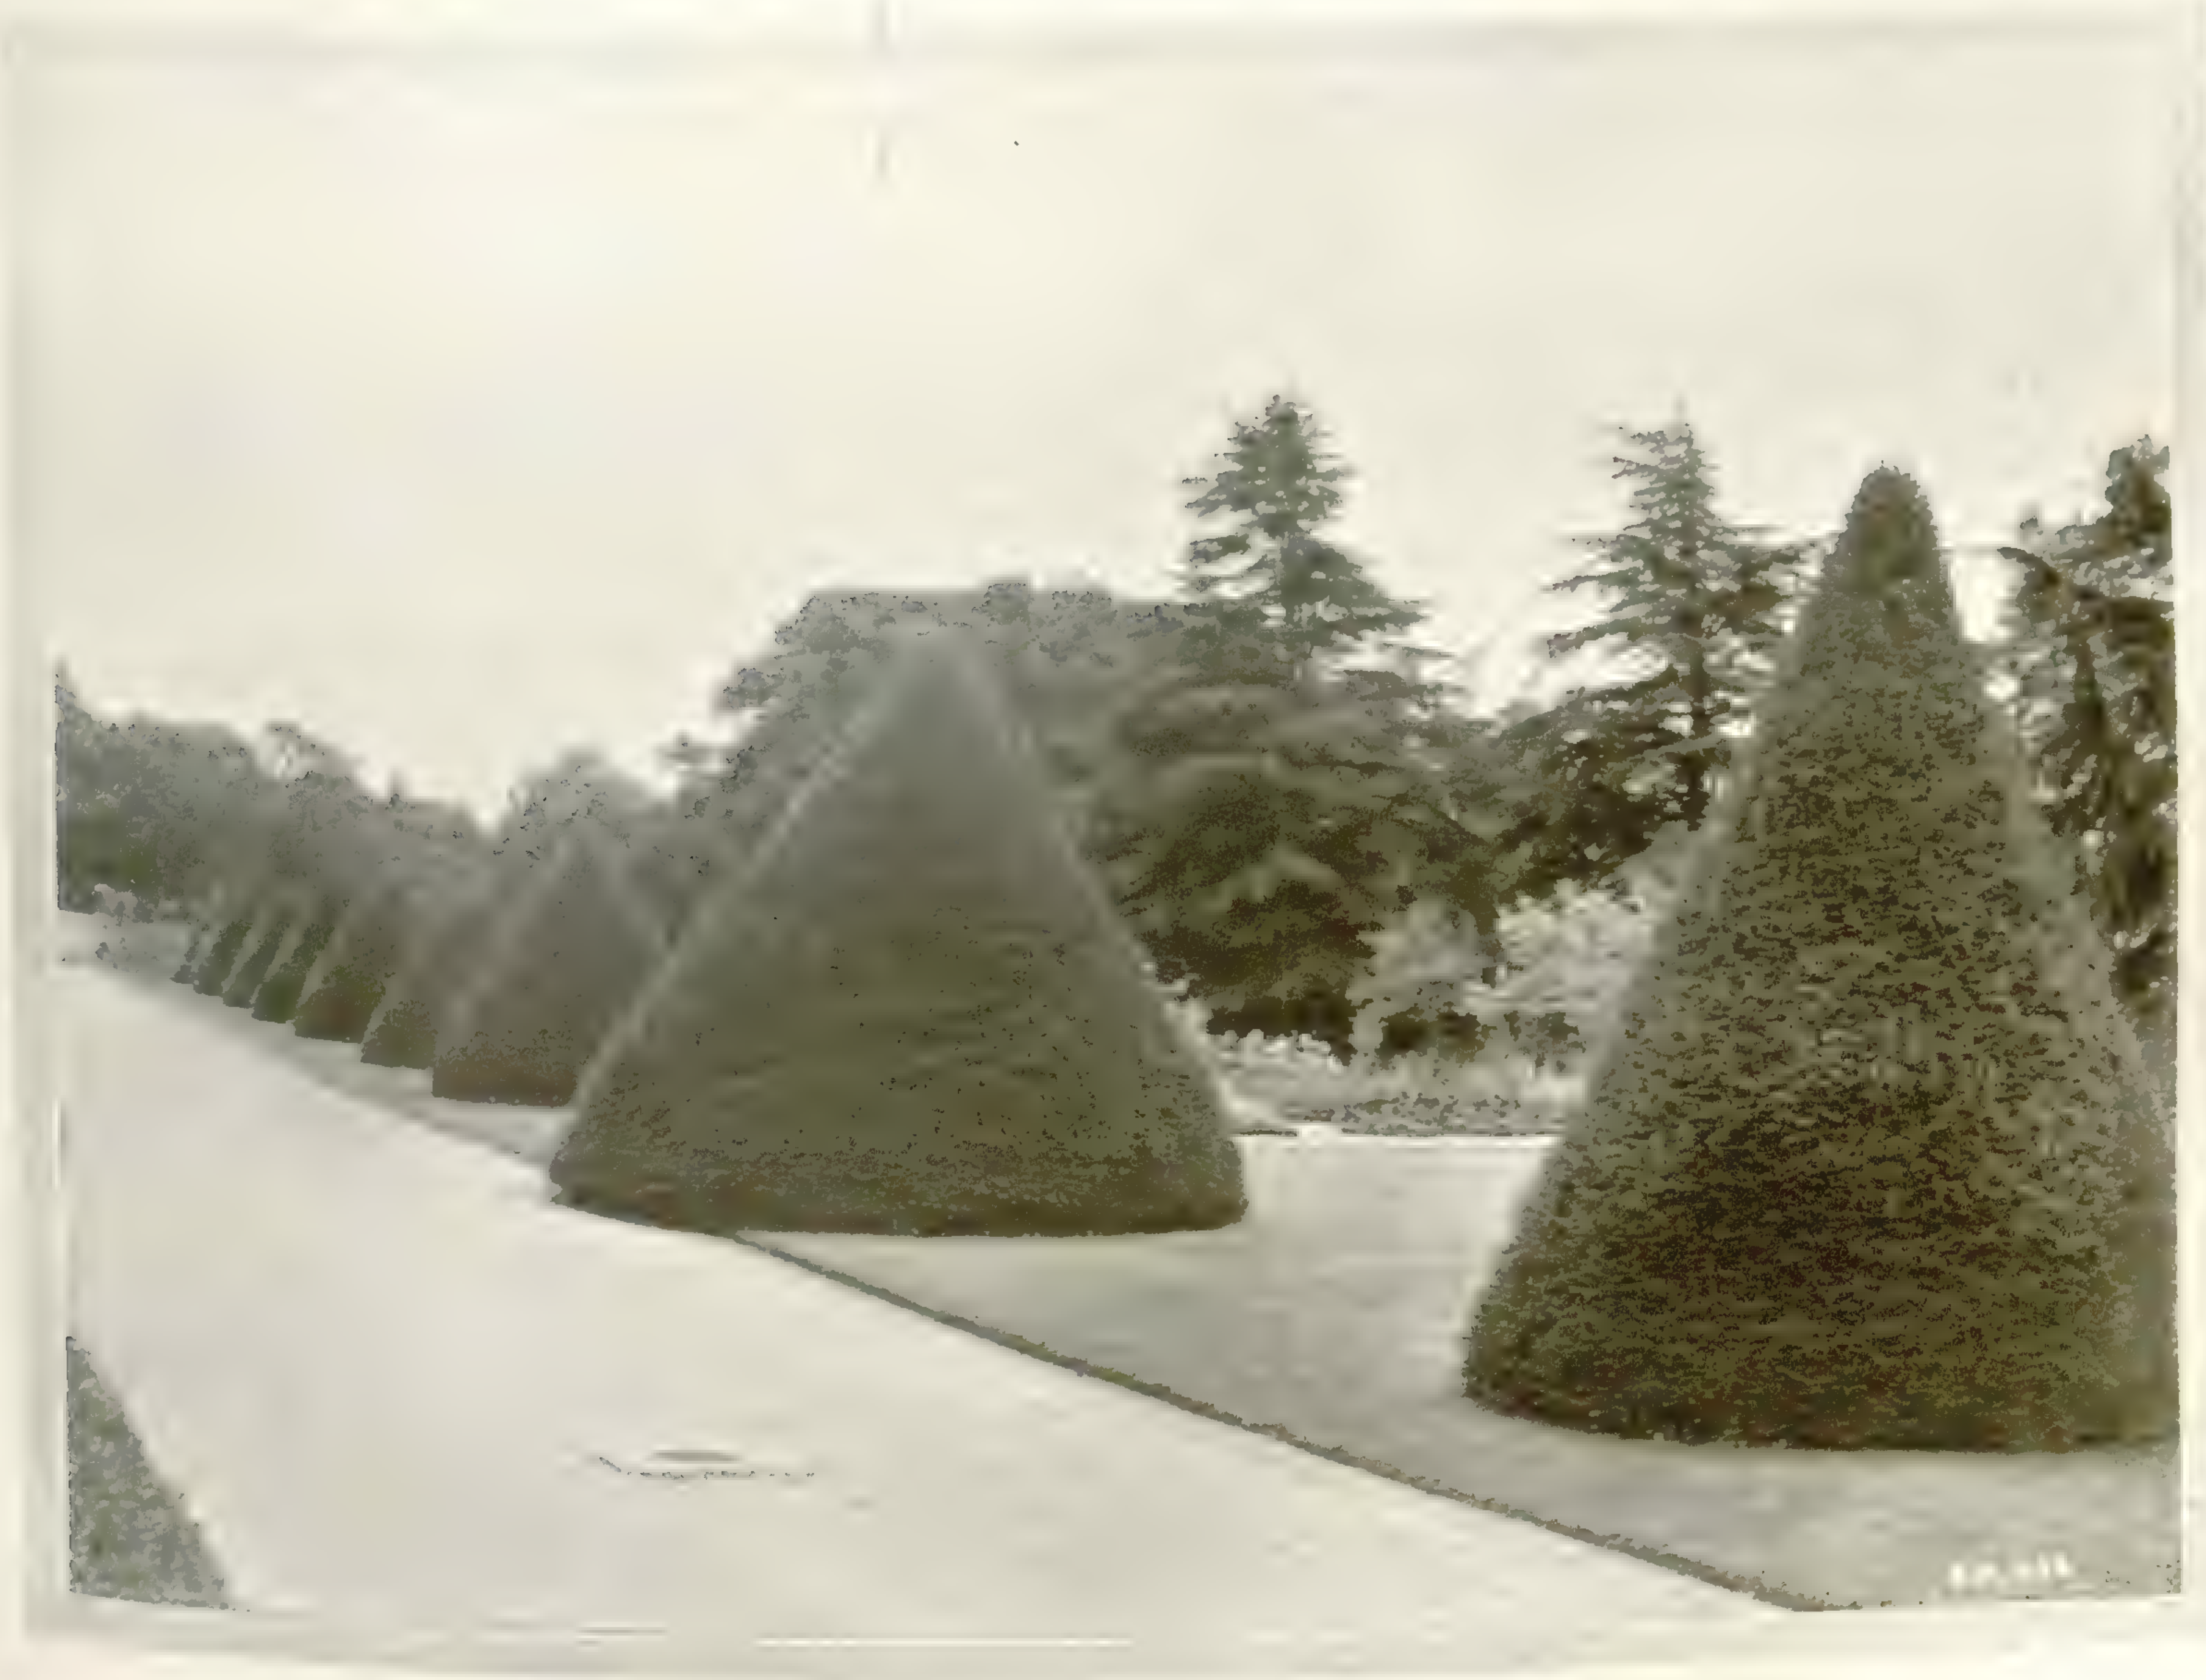
A visit to Aldermaston Court necessitates a journey of about ten miles, which may be accomplished wholly by road, or partly by rail and partly by road. Either is pleasant, but to drive the whole way is preferable, as a much better opportunity is afforded for enjoying the scenery to the south-west of Reading. The journey takes one to within a short distance of the northern boundary of Hampshire, and also of Silchester, which enjoys considerable fame, especially in antiquarian circles, for its Roman remains. Aldermaston is not, however, the best point from which to visit the site of the Roman town, as Mortimer Station is nearer, and otherwise more convenient. There is no occasion to describe the characteristic features of the scenery that lies between Reading and Aldermaston. It will be sufficient to say that it is varied and pleasant, and that fine crops on the arable land which is seen on all sides cannot well fail to give pleasure to those who are interested in country life. The village of Aldermaston is picturesque, and the railway station provided for the convenience of the inhabitants is certainly far enough away to ensure their being undisturbed by the noise of trains. Not far from the railway station is the wharf, on the portion of the Kennet which has become known by reason of its seclusion as the "backwater of the world." For a considerable period immense quantities of osiers for basket making were despatched from the wharf, but osier culture in the Kennet Valley has for many years been a declining industry. There are still osier beds, but from what one hears in the district they are not very profitable at the present time.

The entrance to Aldermaston Court, the seat of C. E. Keyser, Esq., from the north, is at the far end of the village, and in entering the park the visitor should not fail to notice the handsome iron gates, which were brought from Midgham House by Mr. Congreve when the estates passed into his possession in the distant past. The mansion and pleasure grounds are some distance from the entrance gates, but the walk or drive through the park is pleasant, and associated with much that is of interest to those who are concerned with arboriculture. It occupies rather high ground, has an area of about one thousand acres, and, half a century ago, abounded in snakes, for these reptiles were not only given sanctuary, but the people were encouraged by liberal payment to collect them for the purpose of augmenting the numbers. There is a large lake and severa smaller sheets of water, and great breadth of bracken that are particularly attra in the autumn, when the large, spread fronds assume the rich tints peculiar that season. The most noteworthy fe tures of the park are, however, the no oaks, the wide-spreading cedars, the an cient yews, and the tall limes, many of th last-named being noteworthy from the fa that they formed part of the avenues whi at one time were a distinctive featur of the park.

The fine Elizabethan mansion, which was built about sixty years ago, occupies a prominent position in the park, and has for its setting extensive flower gardens and pleasure grounds. Th most important, and certainly the most attractive, part of the grounds immediately surrounding the mansion is the terrace, o which two views are given herewith. Her are great beds of roses, containing vari that have been selected with due regard continuity of flowering, various orname tal shrubs, finely developed coniferous an other trees, the specimens of Cedrus De dara being particularly notewor beds of tender plants remarkable fo of leaf or flower. These latter are m arranged in the geometric scheme opp the mansion, and of this a glimpse i tained in the illustrations of the cl clipped yews, which form so disti ture of the terrace, and give expression to the broad prom ing across this flower garden fro sion a beautiful view is obtained the tall elms of the surrounding co and in the making of the scenery comes within the range of vision, g dow, glistening lake, bosky w rising hill, has each contributed The pyramidal yews are of considerabl age, and it is curious to see that the specimens was allowed, probably youth, to extend at its base a much gr



MANSION AND TERRACE GARDEN, ALDERMASTON COURT.



PYRAMIDAL YEWS ON TERRACE, ALDERMASTON COURT.

distance than the others. It will be seen that while the others have not been allowed to reach the margin of the grass, this one has been allowed to extend over it. The point is interesting, but of no great importance, and doubtless those who had charge of the trees in their early stages had good reason for what they did in this particular.

The kitchen and fruit gardens and the glass houses are within a short distance of the entrance to the park, and here one might linger long, for, as so well known throughout the district, the gardener, Mr. A. Galt, is a cultivator of great ability. If no reference can now be made to these important departments, the broad lake contiguous to them must be mentioned. Here one finds floating on the surface of the water a large number of the finest of the water lilies now in cultivation, and producing an abundance of splendidly developed flowers. The lake is liberally furnished, but there is no crowding, and each of the numerous forms has been kept separate from its fellows. The practice which obtains here might with advantage be adopted in some other cases, as under no conditions do the several kinds present a more pleasing appearance than when they are able to fully display their distinctive characteristics.

Wokefield Park.

An account of the more noteworthy gardens around Reading would be strangely wanting in completeness were no reference made to those of Wokefield Park, and all who know these gardens will share with me a feeling of regret that they cannot be described at greater length than is now possible. Wokefield Park, which is the seat of Alfred Palmer, Esq., is situate about six miles to the south of Reading, and may be readily reached by railway to Mortimer Station, usually spoken of as a mile from the mansion; but those who prefer to allow themselves some margin in catching trains would probably act wisely in regarding the distance as between a mile and a quarter and a mile and a half.

Whether the distance from Reading be six miles or a mile and a quarter from Mortimer Station is not a matter of great consequence, and the point need not be laboured. Of greater interest will it be to learn that the journey either way is a pleasant one, that the stately mansion has a beautiful setting, and that the gardens are remarkable alike for their extent and their high keeping. Here, as in some other of the districts to which reference is made, the scenery is extremely beautiful, and remarkable for its diversity of character. The park has a large area, is liberally furnished with trees distinguished by their nobility of aspect, and occupying a prominent position therein is the handsome stone mansion that impresses one by its long façade and its appearance of solidarity. Extending the whole length of the mansion is a broad grass terrace, supported on the park side by a low wall, and from this, as from any of the windows, a delightful view is obtained of the park and its fine expanse of water, and, indeed, of the country far beyond. The terrace is remarkable for its fine breadth of turf, whereon lawn games are played under the most favourable conditions, and at one end, where it widens considerably, and appears to pass imperceptibly into the park, there is a group of flower beds, which, tastefully filled, contribute liberally to the attractions of this part of the gardens. Occupying prominent positions in various parts of the lawns are many fine specimen trees, and of these special mention might well be made of the noble examples of Araucaria imbricata and Sequoia gigantea, which are two of the most attractive of coniferous trees for the lawn, when, as here, they retain their lower branches after having attained to goodly dimensions. Beyond the flower beds are shady walks amid aborescent features of much interest, conspicuous among them being that formed by the large examples of the Portugal laurel, which throughout the grounds grow with great luxuriance.

Connected with the pleasure grounds, at the other end of the terrace, are the kitchen and flower gardens, which have been designed and planted with due regard to attractiveness and utility. As a matter of course, when considerable improvements were made in these departments by Mr. Woolford, the gardener, nine years or so ago, due regard was paid to making provisions for abundant supplies of all kinds. This much may at all events be assumed, judging from the results obtained, and it may be assumed with equal safety that when he had made these provisions he proceeded to take the steps necessary to render the departments attractive with flowering plants. In walking through the kitchen and fruit gardens one sees large numbers of roses grown in various forms, the arches being especially attractive, and borders that are filled with plants well suited for the supply of flowers for decorative purposes. The great feature of the gardens, however, are the two broad borders of hardy flowers that flank the walk which runs the whole length of the old and new gardens. These borders are probably the longest of their kind in the United Kingdom, and they are remarkable for the success that has been achieved in the endeavour to provide a continuous display of flowers throughout the season. It not being practicable to satisfactorily portray the whole of the two borders, an illustration is given herewith of a portion of [illegible] near the handsome gates through [illegible] access is gained to the terrace and [illegible]

Fruits and plants under glass are grown with so much success that one would have been glad to direct attention to some of the more important of the object-lessons that came under notice when walking

PORTION OF HERBACEOUS BORDERS, WOKEFIELD PARK.

through the numerous structures, but the space is exhausted, and what has proved a very pleasant talk must be abruptly brought to an end.

George Gordon.

IRIS GARDENS.

Certainly one of the most delightful features of the modern garden is that known as the iris garden. The popularity of the various types of the iris has extended very rapidly of late years, and few groups of hardy flowers have done more in beautifying the garden.

Popular as they unquestionably are, we have not yet utilised to the full the wondrous possibilities of the irises; and, though the late Sir Michael Foster devoted the main portion of his interesting garden at Shelford to their culture, much more remains to be done before they are appreciated at their true worth. Iris gardens are at present few and far between, and even in places where much space is devoted to the iris they are subjected to the detrimental effects of having unsuitable plants grouped near them, or are so poorly arranged that half their beauty is practically lost.

Japan has taught us something about the wondrous attractions of a garden of irises. Those glowing breadths of Iris Kæmpferi, which travellers have extolled and have fascinated the eye of the artist, are glorious in the extreme. Pen utterly fails to describe their magnificent colourings and their indescribable charm. Irises of the Kæmpferi type are certainly glorious, and grouped by the waterside, or in moist boggy ground they are unsurpassed in effectiveness. The possibilities of these irises, together with those other splendid moisture-loving forms, such as [illegible], aurea, orientalis, Monneiri, Delavayi, spuria, monspur, monaurea, and their numerous varieties, gives one ample material for clothing the moister portions of the iris garden, or, better still, they could be utilised for margining a watercourse or lily pool.

Nothing is more charming than a daintily conceived waterway, or a series of lily pools flanked with bold groups of the irises mentioned. Picture it if you will. The soft, exquisite colourings of the flowers of the early nymphaeas resting upon the bronzy-green leafage, and the blue, gold, and purple of the irises, shading away through the maze of opal tints, and softest colourings to the purest white, their glorious forms mirrored in the water, and the summer sunlight giving its glowing rays to assist in the expression of beauty. Surely such is worthy of the central place of the iris garden. And with the moisture-loving irises as the pivot, one can freely group the many other sections of irises, until the delightful comprehensive scene of the iris garden is complete.

Individual taste in selection and grouping will add greatly to the charm, and will ensure for the garden a characteristic interest all its own. The more inclusive one can make the selection the greater is the interest of the garden. The Germanica, Siberica, pumila, unguicularis, versicolor, and similar groups can be readily drawn upon. Bulbous irises should also be pressed into service, as they furnish several early-flowering forms possessing much beauty, and also include the popular Spanish and English irises.

Without wishing to trespass upon the patience of the reader, one might suggest that the rarities should be well represented, for by their inclusion one has a great asset in determining the popularity of the garden. It is important to group the species and varieties boldly, for there must be nothing weak in the planting scheme. Those forms which love a fairly dry position should be given the preference for the higher ground. Regularity and formalism in design and planting will rob the garden of half its beauty. The beds or groups may be broken up by turf walks, but by far the better plan is to arrange a good irregular stone pathway through the main portions of the iris garden, and to break up the groups and varieties of irises by groups of other plants of a dwarf yet light character. The effect of breadths of myosotis, cerastiums, heucheras, tiarellas, anemones, linums, dwarf gysophilas, and many other dainty plants, intersecting the great masses of the sword foliaged irises will be more than pleasing.

There is so much of beauty and charm in the iris garden, and whether the main features rest entirely with the irises, or whether you combine kindrid subjects with them, the essential points of interest and beauty will have that same pervading charm, making it the most popular feature of the pleasure grounds.

P. S. Hayward.

TERRACE FLOWER GARDEN, WOKEFIELD PARK.

Agapanthus umbellatus minor.—There are several agapanthuses in cultivation, all of which, according to the "Kew Hand List," are but varieties of A. umbellatus. This is of small growth, and free in blooming, and well suited for decorative purposes when grown in pots of small size. The leaves are narrow, and almost grass-like, while the flower stem, which attains a height of about eighteen inches, terminated by an umbel of flowers that, individually, are not quite so large as those of A. umbellatus itself, while they are also somewhat paler. All the forms are valuable for the embellishment of the greenhouse during the latter part of the summer and early autumn. K.

SOME DWARF CATCHFLIES.

It is generally of greater benefit to the gardener to write of flowers which are in the hands of the trade, and can be purchased at a reasonable price, than to describe rarer and unprocurable species which, however beautiful, are not to be secured for the garden. The latter, being unobtainable, are of little more than academic interest to the ordinary cultivator of flowers. Thus at present I shall not venture to speak of any of the silenes except a few which are readily obtained, and, at the same time, are quite inexpensive, and generally easily grown.

Silene acaulis.

The first to be named is the Stemless Catchfly, or Cushion Pink (Silene acaulis), together with its varieties, the whole forming an exquisite group of much beauty. The close carpets of verdant green are very beautiful in themselves, but when these are sheeted with the charming little rose-pink or white flowers it is difficult to conceive anything more fascinating among the members of the alpine flora.

The flowers themselves seem almost to nestle on the leaves, and there is no one who can see a clump of this little cushion pink without admiring it. It is not, however, always satisfactory in the rock garden, missing, as it frequently does, the moisture at the roots in which it delights when it is in full sunshine, and too often do we see it giving only a few sparsely scattered blooms over its carpet of green. It likes a sunny position, in moist, sandy, or peaty soil, but if given a dry place will give but little satisfaction. The typical S. acaulis has flowers varying in colour, but they are generally of a good rose-pink. There is also a white variety, alba, together with one with double flowers, but this, the colour of which is pink, is not so free of blooming or so vigorous in growth. Exscapa is a dwarfer form, and there is one still more compact, but, so far as I know, not in commerce, called muscoides. This species and its varieties are increased by division after flowering.

Silene alpestris.

The Alpine Catchfly (Silene alpestris) is a little plant, is so easily cultivated, and gives its beautiful little flowers so freely that it deserves the gratitude of all admirers of the prettiest white alpine flowers. It is thoroughly hardy, very neat and dwarf in its growth—its height being from four to six inches—and exceedingly pretty, with its white flowers, elegantly notched, and shining as if polished. These flowers are well uplifted above the glossy green leaves, and, as they are freely borne from May onwards for a month or two, they are highly valuable. This species likes to be among small stones, but should not be too dry at the roots if it is required to assume a healthy aspect and to flourish and increase. It is raised from seeds or multiplied by division, and is, taking it all in all, one of the most useful of all dwarf alpines with white flowers.

Silene Elizabethæ.

Elizabeth's Catchfly is one of the most charming of alpines, but it always remains comparatively rare, and is more expensive to purchase than the majority of the race. This fact points to its being more difficult to cultivate, and it is generally found that the plants usually sold, which are necessarily small on account of the difficulty of keeping the plant, often fail. Strong established plants from pots, and planted out in a sunny place in loam, sand, and grit, have a much better chance of success than these, but, although much has been said to the contrary, it cannot be accounted a plant for the many. It is, however, a great beauty, with its tufts of rather pubescent leaves and its wonderfully large rose-coloured flowers on little stems three or four inches high.

Silene maritima.

But for the beauty of its double form, the Sea Catchfly, or Sea Campion (Silene maritima) need hardly be mentioned. This form, called S. maritima fl.-pl., is, however, an attractive little plant, useful for trailing over a small stone or for covering a low flat terrace. The white flowers are wonderfully like those of a double pink, although they are devoid of the fragrance of that favourite flower. There is also a rose-coloured form of the single sea campion, but I am not greatly enamoured with it. The glaucous leaves of both are pretty, and they can be grown in almost any soil, from pure sand to stiff loam.

Silene pumilio.

Like Silene Elizabethæ, the Pigmy Catchfly is easier to grow on paper than in practice, and it ranks in price along with that scarce flower. It is like S. acaulis in many ways, but is much smaller in its growth, and has larger flowers of a finer rose colour. It is a species which likes a sunny place in summer and winter alike, but it must have plenty of water about its roots in the former season. Sandy loam, with grit in the compost, and a sunny position, are the orthodox requirements, and it is wise to endeavour to provide these for the Pigmy Catchfly. It grows about three inches high, and blooms in May.

Silene Schaftæ.

Schafta's Catchfly is one of the most useful of all, its pretty, deep pink flowers coming late in the season when other alpines are scarce, and lasting for a long time. It grows about six inches high, and will often bloom from June until October. It is easily raised from seeds, and is one of the cheapest of the species, while it is also one of the prettiest. It will grow in common soil, and is excellent for the rock edging.

Such are a few of the most easily obtained and prettiest of the dwarf catchflies or campions. Their beauty is unmistakable, and their flowers in their season will serve to minister to our enjoyment, and will render our gardens more full of pleasure to all.

S. Arnott.

Vallota purpurea.—Of late years we have had large quantities of the Scarborough lily imported from South Africa. The bulbs appear to have been collected in a wild state, and, as a rule, the growth is tall, and the flowers very poor in shape compared with the older forms which have been in cultivation for many years. One of the latter, to which the varietal name of magnifica is applied, is of dwarf, sturdy growth, with the segments so broad that the flower is almost circular. The colour is a rich scarlet, with a very light centre. I have known this variety for nearly forty years, but in the far off days it used to be called eximea, the magnifica of that period being a tall, stately plant, with fine, rich-coloured flowers of a uniform tint, being entirely without the light centre. The dwarf, sturdy type, according to my experience, flowers with far greater freedom than the imported forms. That interesting hybrid between the vallota and Gastronema sanguinea, which is known sometimes as Vallota hybrida, and at others as Gastronema hybrida, is of interest. The blooms are smaller than those of the vallota, and do not expand so widely, while in colour they are more of a vermilion tint.—W. T.

THE FRENCH SYSTEM OF CROPPING.

The French system of growing winter salad plants and vegetable crops under cloches, placed over warm manure, is creating a great amount of interest in this country at the present time—more especially, perhaps, for supplying market centres than for private gardening. The profits therefrom, as given in some reports, are certainly an incentive to give the system a fair trial, even if you divide them by one-half. The French [illegible] population are known to be a studious, thrifty, economic, and successful people, and around Paris some largely derive their income from this form of cultivation, generally known as intensive cropping. It therefore behoves us to give the matter due consideration, and to carefully compare their methods with our own, and to adopt them in part or as a whole if found to surpass our present system of production.

The president of the Chester Paxton Society, Mr. Gibbons Frost, said at a meeting of the society that he had been on a visit to France, and, from what he saw of the French mode of culture, it had so much impressed him that, on his return home, he decided to give it a fair and impartial trial in his garden at Chester, and generously invited those who were interested in this to pay him a visit to enable them to form an opinion of its value to us. This brings me to the point. How can we, with advantage, adopt it for supplying a private establishment with its varied daily demands? Speaking with reserve from a limited experience of the system, it does not appear likely that it will be generally taken up by the English gardener. It appears too exacting and complicated with so many crops intermixed, and, unless relegated to a frame ground, the necessary quantity of appliances, covering, etc., lying about, is not in accordance with the order and neatness usually seen in good English gardens.

The labour, too, in covering and airing the crops in the cloches is considerable during extreme weather, and this cannot be given the close attention with the many calls of a private place, as in the case of one who is on the spot devoting his sole energy and time to the production of market crops. Taking into account everything connected with this style of forcing, there does not seem great advantages over our present system of production with pits and frames. There is, in many cases [illegible] private places, a difficulty in showing the necessity of a sufficient quantity of [illegible] which need not be of an expensive character, but are invaluable during the winter [illegible] spring months, especially for forcing and protecting purposes. Where the requisite number of frames, etc., are provided, and [illegible] the improved varieties of cabbage lettuce [illegible] our disposal, there is no difficulty in [illegible] a supply through most of the year. [illegible] the season round, if due care is exercised [illegible] sowing at the proper time during [illegible] autumn, and bringing the plants on in sheltered positions to be covered with glass [illegible] severe weather sets in, followed on with [illegible] sowings in the first part of January [illegible] forced in the usual way over mild [illegible] Endive, too, may with protection [illegible] long as required, and blanched as desired [illegible] any dark position with a temperature ranging from 50 to 60 degrees, easily [illegible] most of our gardens. Chicory is [illegible] easiest to procure, as it very readily commences growth and blanches when [illegible] to any warmth from 45 to 60 degrees [illegible] light is excluded. With these plants [illegible] early carrots, potatoes, etc., our way of [illegible] ing them seems to us simple and [illegible] In the desire for knowledge and [illegible] ment it is very interesting to know [illegible] learn something from our French [illegible] that may be of use to us. Probably we can not do better than Mr. Frost, in making experiments of their methods for ourselves, in a small way.

C. Flack.

Cholmondeley Castle Gardens.

THE FORSYTHIAS.

Few shrubs are more floriferous or are calculated to make a better display of bloom during early spring than the forsythias, while few shrubs are more amenable to general cultivation. They thrive in many sorts of soil and in a variety of situations, are easily propagated, and attain flowering size in one year from the time the cuttings are inserted. In addition to the bright display they afford the latter part of March and in April, they may be used for forcing, for greenhouse or conservatory decoration, and large plants lifted from the shrubbery and forced gently so as to be in bloom early in February, are extremely useful for decorations, either as house plants or cut flowers. For beds on the outskirts of lawns, masses in the woodland, groups in the shrubbery or for covering trellises, they are equally desirable, and they are within the reach of all, as they may be obtained at a very cheap rate. The species in cultivation number three, but in addition there are several varieties and a hybrid.

NARCISSUS KING ALFRED.

As exhibited by Messrs. James Carter and Co. at the Meeting of the Royal Horticultural Society on the 6th inst., and described in our report at page 286 of our issue for the 10th inst. King Alfred is one of the finest of the golden trumpets, and so large a display attracted much attention.

F. suspensa.

This is a Chinese plant, which has been known by the names of F. Fortunei and F. Sieboldi, in addition to the correct name. Grown under natural conditions it forms an elegant bush 12 feet high, with a few stout main branches and numerous slender pendulous branchlets. It succeeds well amongst evergreens, where the long slender branches can trail over the surrounding bushes. Placed against a trellis, with the main branches secured and the side ones allowed to hang loose, it is also effective. Grown under the former conditions, it requires practically no pruning, but when planted against a trellis the side branches should be cut back each spring.

There is, in addition, another way in which this species may be grown effectively. This is by preparing beds of rich soil and filling them with plants 4ft. apart. These plants are then cut over 2½ or 3ft. from the ground, as soon as the flowering season is over. During summer strong upright shoots 3 to 4ft. in length are formed, which bear blossoms from base to summit the following spring. Each year, as soon as the flowers fade, the annual branches are cut back to within two or three buds of the base. The process is an exhaustive one, and it is necessary to mulch each spring with well rotted manure. When the plants show signs of deterioration they should be thrown away, and be replaced with a fresh lot of plants.

F. viridissima.

This is another Chinese plant. It differs from the foregoing by forming a dense upright bush, with very green branches and deep green leaves. The flowers are borne profusely, but they are a little later than in the former species. It may be used for beds and groups, but is not serviceable for trellises. Very little pruning is necessary, except when plants are growing out of bounds. It is not so useful as F. suspensa for forcing purposes.

F. intermedia.

This is a hybrid between the foregoing plants, and in habit and general appearance it is intermediate between the two. It requires very little pruning; in fact, it blooms better when left unpruned. Old plants 8ft. high, and bushy, are frequently masses of yellow blossoms in spring. There are several very floriferous varieties, of which vitellina and densiflora are distinct.

F. europæa.

A lot of notice was taken of this shrub a few years ago, in so much as it is an European plant, and the genus was not known to be represented wild in Europe previously. It was found in Albania, and was introduced to commerce six or seven years ago. So far as gardens are concerned, it is practically useless, for all the other forsythias are infinitely better and flower much more freely. As in the other cases, it has yellow flowers. Some variation is noticeable in a batch of plants, some being hairy, others glabrous, whilst the leaves of some are lobed, others not.

All the forsythias may be propagated from cuttings of soft shoots in May or June, and cuttings inserted at that period do much better than those taken later when the wood is partly set. If put into gentle heat, roots are formed in about a fortnight, and the young plants may be placed out in a border about a month after the cuttings are taken. By this means a good growth is obtained the first year.

Kew. W. Dallimore.

Lily of the Valley from Denmark.—We have grown so used to Berlin and Hamburg lily of the valley crowns that we look doubtfully upon crowns from elsewhere. But Denmark has taken up the culture of crowns for forcing, and last autumn sent a considerable quantity to London. These crowns, after cold storage, force well, and the demand for the Danish produce appears likely to increase.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CATASETUMS, cycnoches, chysis, and other allied genera, will now be producing their new growths, and in some of these genera the flowers will also make their appearance with the young growths. These must now have more liberal treatment in respect to the application of root moisture. Practically the whole of this section may be grown in the cattleya house under the same atmospheric conditions. To induce the majority of this section of orchids to flower satisfactorily, it is desirable they should be given ample light, and where they can be grown suspended from the roof with just sufficient shade to prevent the foliage becoming scorched, they generally yield a satisfactory return of flowers.

LYCASTES.—This is another class of orchids that are not cultivated so extensively as they used to be, or as their merits deserve. They are exceedingly useful, being winter and spring flowering. Many of the species not only retain their flowers in perfection for many weeks, but they are also exceedingly useful for the supply of cut flowers. The period of the year at which the plants are flowering depends to a great extent on the treatment given them. Where they are grown in a warm intermediate house the flowers are produced throughout the greater part of the winter and spring months, but where grown cooler, the flowering season is naturally later. There can be no doubt that the best colour and substance is produced under the cooler methods of treatment. This is accounted for by the more favourable conditions prevailing outside, when the flowers are in process of development. The new growths of the plants that flowered early will be advancing rapidly, and as soon as the new roots make their appearance, any repotting requirements necessary should be attended to before the roots become far advanced. Before repotting lycastes it is advisable to water them well the day previous to their being repotted. This will not only moisten the old potting compost, and thereby facilitate its removal, but it will enable the roots to part more readily from the side of the pots. It will generally be found that by giving the roots a good watering some time previous to removal, even the strongest rooted orchids are the more easily detached. Avoid over-potting, and select pots just sufficiently large to secure the plants comfortably. Fill the pots to about one-third their depth with clean broken crocks. The potting compost may consist of about equal portions of fibrous peat, Osmunda fibre, and turfy loam; to this may be added sufficient sand or finely broken crocks to render the compost porous. In districts where there is a considerable obstruction to light, the compost should consist of peat, osmunda fibre, and chopped sphagnum moss. The compost should be pressed moderately firm. Water as soon as repotting is completed, and shade from the direct rays of the sun until the roots are pushing into the new compost.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

SYRINGING, ETC.—In the stove at this season, when growth is rapid, the afternoon syringing is important because humidity thus created allows the house to be shut up while the sun is yet powerful, without in any way causing scorching. With the increase of ventilation, and, of course, evaporation, frequent syringing and damping down is most essential.

EDGING PLANTS.—Give attention to the supply of young and fresh material for furnishing the edgings of stages, etc. such as Isolepis gracilis, Ficus radicans, tradescantias, panicum, Rex begonias, Pilea muscosa, and similar plants.

COLEUS THYRSOIDEUS.—When once this plant has been cultivated for winter decoration its propagation is not likely to be overlooked, because of its usefulness. When in flower, associated with white chrysanthemums, or white lilac, the effect is good. Plants that have finished flowering should be cut partly down, and encouraged in a warm house to produce cuttings. Bush plants are very attractive, but we much prefer plants with from one to three stems and flower spikes, and from 4ft. to 6ft. in height; and when the plants are grown strongly, large flower spikes result.

CALADIUMS.—Pot up more tubers to give a succession to those earlier started, using a compost consisting of equal parts of peat and loam, with plenty of sharp sand. As caladiums are seldom benefited by repotting the pots should be large enough to carry the plants through the season. The tubers should never be placed deeply in the soil; place them in a temperature of from 65 to 70 deg., and be careful at first not to give much water, but when growth is active feed and water freely.

TUBEROSES.—Fragrant flowers can be and are produced with equal success by warm or cool treatment, from the bulbs of these plants. Yet many failures have been recorded, due principally, one may presume, to the application of water before the bulbs had made any leaf growth. To encourage early root action plunge the pots in a bottom heat of 65 deg., and give no water until growth has started freely, when weak liquid manure may with advantage be given. The flowers will continue in good condition for a long time if given shade from strong sun in a cool house.

EUPHORBIA JACQUINÆFLORA.—When cuttings can be secured from the well-ripened wood, they strike more readily and grow more freely with a heel of the old wood attached. Put three cuttings near the edge of a small 60-sized pot; and when turned out, rooted, pot them singly. Employ good loam, peat, leaf-soil, and sand, and place in a temperature of about 80 deg., when they will soon take root. As the plants increase in size, charcoal in small pieces, and quarter-inch bones may with advantage be added to the soil, but in all stages of growth give no more water than is really necessary, and that is not much.—W. FYFE, Lockinge Gardens.

FRUITS UNDER CLASS.

THE EARLY VINERY.—Keep the laterals pinched frequently, never allowing them to become so long as to necessitate using the knife. The stopping of the shoots is not to check the vigour, but to direct it into the proper channels. As soon as the berries begin to stone, extra care should be exercised to prevent undue check. After stoning, the stopping must be done very thoroughly, little and often, and with the thumb and finger. Tie up any shoulders which will be of benefit to the bunch, as by this means the berries have a much greater chance of development, though any untidy shoulders should be cut away. At this stage it is a good plan to look over all the bunches very carefully, and see that the thinning has been properly done, and if an odd berry or two requires removal attend to it at once. A good bunch of grapes should be just tight enough to keep its position when placed on the dessert dish. Grapes like Madresfield Court and Gros Maroc require a good deal of judgment, and should be thinned heavier than Hamburghs and Sweetwater grapes. See that the borders do not lack moisture; have the walls and floors frequently damped, and admit a little air at 6.30 every morning; an opening of half an inch at the top will be sufficient, and if it be a sunny morning, gradually give more air.

SUCCESSIONAL HOUSES.—Continue to disbud and tie down the growths as necessary. Remove strawberries from vineries as soon as possible, and never allow them to become dry, or they will soon become a prey to red spider, and then cause trouble. The Muscat house should now have a rise in temperature to 60 or 65 deg., and by the time the vines come into bloom it may be raised another 10 degrees, as Muscats revel in plenty of heat. Syringe well both morning and afternoon, and occasionally damp down according to the weather.

EARLY PEACH HOUSES.—Tie down [illegible] growths regularly, and fill every avail[illegible] space with young branches, as these [illegible] make the fruiting wood for the next [illegible] Any old worn-out branches, with no [illegible] may be cut out and new wood trained [illegible] their place. See that the crop is not too h[illegible] better have a moderately good crop [illegible] a heavy one of poor fruits. It is a very g[illegible] plan to change the early house once [illegible] and again, as it cannot be expected that [illegible] can be forced year after year without [illegible] or partial loss of crop. This applies to [illegible] early forced trees only. Successional [illegible] may be treated similarly to the earlier [illegible] and at this time strict attention must [illegible] paid to disbudding and thinning the [illegible] All disbudding should be done in the [illegible] stages of growth.

LATE STRAWBERRIES.—These should now be placed under a north wall [illegible] advancing too rapidly in the frames, and [illegible] are much better treated thus than [illegible] shaded in frames. Strawberries fruiting and showing fruit should be thinned in the [illegible] stages, and be well fed to the time they [illegible]mence to colour, when feeding should [illegible] All fruiting plants, as soon as the [illegible] gathered, should be at once turned [illegible]

MELONS.—Batches should be sown [illegible] the late summer supply, and as a [illegible] to those recommended in a former [illegible] These may include similar varieties. [illegible] the earliest crop a good top-dressing [illegible] with some fertiliser mixed with it. [illegible] will give the fruits and foliage the [illegible] requisite at this stage. Melons grown [illegible] cordon principle may carry four fru[illegible] melon of about 3lb. weight is much [illegible] than a very big one, as they can be [illegible] when sent to table.

TOMATOES should be kept rather [illegible] as too much moisture will cause the [illegible] to crack. Those ripening now in pots [illegible] be afforded liquid manure occa[illegible] Seeds should now be sown for a late [illegible] batch. Tomatoes in private establi[illegible] should not be kept about after the ma[illegible] of fruit has been secured, as they ge[illegible] look untidy, and the fruits deteriorat[illegible]

ORCHARD HOUSE. — Where cherries, plums, pears, etc., are grown, the house will now be gay with bloom. The cherries must have frequent washings if at all a[illegible] with black aphis.—W. A. COOK, Le[illegible] Gardens.

THE KITCHEN GARDEN.

FRENCH BEANS.—A sowing of this [illegible]able vegetable may now be made o[illegible] most parts of the country. Choose [illegible] sheltered border, where the soil is [illegible] light but rich, to encourage early and [illegible] root action. Draw the drills [illegible] south, at about two feet apart, and [illegible] seeds more thickly than the plants [illegible]quired, to guard against loss, as slugs [illegible] often too ready to attack early plants. Plus Ultra, Perfection, and the [illegible] Canadian Wonder are each dependable [illegible]ties for yielding heavy crops. Narrow glass frames are invaluable for [illegible]ing and forwarding early sowings [illegible] kind in cold and bleak districts.

RUNNER BEANS.—Preference [illegible] times given to an early supply [illegible] and in this case a batch of plants [illegible] brought along by sowing seeds [illegible] 48-size pots to the number required [illegible] soil; grow the plants sturdily in a [illegible] or frame until they are about 12 in[illegible] then gradually harden them off [illegible] out in a favoured position to gr[illegible] advance of those sown outside. [illegible] opinion, the main crop is best sown [illegible] the open, unless proper frames [illegible] be devoted to the plants. [illegible] and Scarlet Emperor are both [illegible]ties.

PEAS.—The weather so far has [illegible] very favourable for planting out [illegible] plants. If the peas reared under glass [illegible] not been planted, take the first [illegible] get them out. They are subject [illegible] growth if allowed to [illegible] Choose soil that has [illegible] manured and deeply dug or trenched.

the rows running from north to south, and give a space of about nine inches from plant to plant. Take care in planting to not unduly disturb the roots. For the purpose of protection stake the plants at once, and should cold winds occur, place laurel boughs on each side of the rows to screen them. It is not advisable to soak the soil with water after planting unless it is unusually dry.

CELERY.—The earliest sown batch of plants will soon be ready for planting out in their trenches. For special produce the single row system of planting is essential to secure a greater root run, and the extra earthing up and attention is more easily carried out. If the crop is grown for the daily supply of the household, plant in double rows, which economises space and labour. The main sowing, made early in March, will be now about ready for pricking out into cool frames at six inches apart. The plants are more easily transferred with good roots if the frame is placed upon a hard and firm base. Use good loam lightened with spent mushroom bed manure, or rough leaf-mould and sand, to a depth of about eight inches, made fairly firm. Keep the atmosphere of the frame humid and moist by admitting very little air, and syringing the plants twice each day till it is seen growth has commenced in the new material; afterwards admit more air.

LEEKS.—The early plants will be in a condition for planting out, if pricked out as required from the seed boxes. These are gross feeders, and the best results are only obtained by providing them with a deeply stirred and richly manured soil. Choose the moistest part of the garden. Trenches are best for producing large specimens.

BROAD BEANS.—A successional sowing of this crop may be made in a cool quarter, such as a north border, to give a late supply. In this position succulent beans are obtained over a long period.

GENERAL REMARKS.—As the young crops appear above the ground keep the Dutch hoe actively employed in stirring the surface between the rows at short intervals. Remove the stems of old green crops as soon as they are of no further value, and have the site manured and dug in readiness for further planting. Prick out young Brussels sprouts and cabbages into nursery beds, and sow seeds to make good any failures. Also make sowings outside of most kinds of plants for salading.—Chas. Flack, Cholmondeley Castle Gardens.

AN OLD-GOLD OROBUS.

There is a very distinct and pretty, although not showy orobus, called by the name of Orobus aurantius, or orange orobus, which deserves a little more notice than it generally receives at the hands of writers on hardy flowers. It comes a little later than the varieties of the spring Orobus lathyrus or Orobus vernus, but its colour is so distinct and good that it is worth having, even where flowers which blow from May until July, its flowering season, are, as a rule, plentiful indeed. There are never too many plants with pea-shaped flowers at that time, and there are fewer still with blossoms of its fine orange or old-gold colour then in bloom. The height of Orobus aurantius makes it excellent for the small border or the front of the large one, as well as for good places on the large rockery. About a foot and a half is its maximum height, but in sandy soil it is usually only some twelve inches high. This depends greatly upon the amount of moisture it receives, but it appears to prefer a considerable amount of this if the soil is both sandy and well-drained. Orobus aurantius, which comes from Iberia, is a valuable plant, which derives its value alike from its hardiness and its beauty, so that it may be more widely cultivated with advantage. It is increased by seeds or by division of established plants, which is best effected after flowering is over, so as not to lose a season's bloom. S. Arnott.

FERNS FOR DECORATION.

During late years many kinds of asparagus have been introduced, and ferns have somewhat lost favour amongst the florists, consequently they are not so much grown now as formerly for the production of fronds. Still, there is nothing so suitable for arranging with choice orchids as sprays of adiantums, or for giving a finishing touch to light and elegant bouquets or sprays; but in order that the fronds may be sufficiently hardened to withstand the rough treatment they are likely to be subjected to, the plants ought to be placed in a cool temperature for some time previously, and none but the oldest and thoroughly developed fronds be used. The enormous quantity of Adiantum cuneatum that was at one time grown for the production of fronds would be difficult to realise, as tons of them found their way into our markets, to say nothing of the quantity used in private establishments. It is, however, not as cut foliage that I wish to draw attention to ferns, but to their value for decorative purposes. Numerous as are the species and varieties, there are but few really good plants for indoor decorations, particularly where they have to put up with the rough treatment many of them are subjected to in the dwelling house.

Of adiantums the most popular are A. cuneatum and its variety gracillimum. These two are readily produced from spores, which will, with due attention, make nice plants in a short time. Batches of these should be sown at intervals, and when the plants are large enough to handle they should be pricked off into pans or boxes about an inch apart, using a light, sandy, peaty soil. When the seedlings touch each other, which they soon will do if afforded plenty of heat and moisture, they should be potted singly into small pots, and when these are filled with roots shift them into larger ones as they require it. There is, however, no necessity to use very large pots, as plants a couple of feet in diameter may be grown in those known as 32's, provided they are liberally treated, and never allowed to suffer for want of nourishment. A. formosum is another species that makes a splendid decorative plant, as its fronds are hard, and will withstand rough treatment. This is by no means particular as to soil, though, given a light, rich compost and a liberal amount of heat and moisture, small plants will soon develop into a useful size, and as they are produced so readily from spores batches should be brought forward to succeed each other. The fronds of this species, when well grown and fully developed, are of fair dimensions, therefore the plants are suitable for large vases.

Where a quantity of house decorations are the order, Asplenium bulbiferum will be found a most useful fern to grow, and there can be no doubt about this being a universal favourite, not only on account of its easy management and rapid growth, but for the peculiar way in which it increases itself. Even those who know but little about ferns delight in watching the small plants which are produced on the surface of old fronds develop themselves, and as they become large enough these may be taken off and transferred to small pots. It is watching these plantlets grow that has caused so many to take an interest in fern culture. Being not at all particular as to soil, so long as ample moisture is afforded the roots, plants will thrive wonderfully in a half-lighted sitting-room, and, given a gentle warmth, they will grow away most rampantly, even in a small pot, and as the fronds become developed they assume a pleasing pendulous habit, which makes them the more attractive.

There are several kinds of pteris that are well adapted for decorative purposes, as their hard fronds enable them to withstand the variable and dry temperature of the dwelling-house. Provided the plants are well rooted, but not too potbound, and have not been grown in too high a temperature, it is astonishing how well they accommodate themselves to such rough treatment. P. serrulata and its varieties are grown by the hundreds of thousands for market, varying in size from those in small thumb pots to specimens in six-inch pots, and as they are so readily increased by spores, which are produced in abundance, there is but little difficulty in having plants in all stages of growth. Though by no means partial as to soil, these ferns grow most rapidly in a mixture of peat, leaf-soil, loam, and sand, and, given a moist atmosphere with a suitable temperature, it is astonishing how quickly the plants develop. The variety P. serrulata cristata is very popular, being of more robust habit and quicker growth than the old form of serrulata. P. cretica albo-lineata and P. Mayi are also useful plants, their light foliage making them very attractive. P. tremula should also be given a place, as this is a fern of rapid growth, and furnishes fronds of a pleasing character which last a considerable time in good condition, provided the plants are well supplied with moisture at the roots. This, too, is easily grown from spores, which are produced in abundance on the old fronds.

In addition to having to produce plants to fill vases, etc., it frequently happens that ferns are required for suspending in ornamental baskets, and for these the following may be found very serviceable, though some of them will not put up with the rough treatment those named above will. Still, in many positions they will be found most useful, and owing to the beauty of their fronds they are specially adapted for decorative purposes. Most gardeners are well acquainted with the old Nephrolepis exaltata, or Ladder Fern, as it is termed, as being a very useful and accommodating species. N. todeaoides is well worthy of a place in all gardens on account of its easy culture. It is alike useful as a basket plant and for growing in pots, and is equally as pretty in a small state as when grown to a large specimen, for its fine feathery fronds are sure to please even the most fastidious fern lovers. The fronds, when fully developed, are from a foot to fifteen inches in length, and from four to five inches wide, the edges so deeply crimped as to render them much like a feather. Like most others of this class, it is readily propagated from the small plants that are produced along the thin wiry rhizomes, or by the crowns or offshoots from the main plant. So far I have not seen a fertile frond. N. Whitmani is another of like character, and though the fronds are not so deeply crimped they are very beautiful. Another which should find a place in all gardens where there is room is N. davallioides furcans plumosum. If there is anything in names, surely some of the ferns have ample to describe them most minutely. The fronds of this, as its name signifies, are feathery, and the plant altogether is most interesting for baskets, where its fronds can hang loosely over the edges. N. rufescens tripinnatifida is useful alike either as a basket or pot plant. Then we have N. Duffi, a dwarf, neat-growing species, producing beautifully tessellated fronds, which, when well grown, are crowded together, forming a compact plant. This species is far better for pot culture than for a basket, as the fronds stand more erect. Being a native of a warm country this requires more heat than some of the other species to grow it to perfection. Nor does it increase so readily as some of the other kinds do, for being of a more tufted character there is no abundance of wiry rhizomes, but by carefully attending to the plant's requirements a stock may soon be worked up by division in spring.

There are several other nephrolepis worthy of cultivation, but the above will be found among the most interesting for general use. They like an abundance of moisture at the root when growing, and, though they are not at all particular as to shade, it is far better to screen them from the bright sunshine. H. C. Prinsep.

Buxted Park Gardens.

NARCISSUS CULTIVATION.

(Concluded from page 288.)

Cultivation between Planting and Harvesting.

The chief labour involved is in keeping the ground clean, and the amount of labour necessary varies according to the condition of the land and the weather. When planting has been done early, say, in August or September, weeds will soon begin to show. These can be kept in check by hoeing (large growers use horse labour), provided the weather is favourable. If it is showery, so that hoeing is not eeffctive, the land must be lightly "pointed," i.e., shallow-dug, in order to bury the weeds. For this work a broad-tined fork is the best tool to use, and the most suitable time to perform this work is at the end of October or beginning of November. If performed earlier there is the risk of another crop of weeds appearing; if done later, the bulbs may be too far advanced, and damage may result in consequence.

During the winter months some growers protect their bulbs from frost by covering the ground with heather or other loose litter, but for the varieties to be recommended this labour is unnecessary. In February, before the foliage pushes through the ground, soot may be applied broadcast and lightly harrowed or raked in. This is especially recommended where bulbs have remained in the same position two or three years.

During the spring months weeds must be kept in check by hoeing and hand-weeding, taking care that the least possible damage is done to the foliage. Treading on the beds is to be avoided as much as possible. When the foliage dies down, if the bulbs are to remain another year, the whole area should be hoed over, and this operation should be repeated two or three times during the summer months, which is all the attention necessary until the period for autumn "pointing" again returns.

Harvesting.

As soon as the foliage has died down, a start must be made to raise those bulbs which it is desirable to lift. No time must be lost in this work, as in the event of showery weather fresh roots will very soon be produced, and the aim of the grower is to get his bulbs out of the ground whilst root-growth is dormant.

Many large growers use the plough for lifting as well as planting. By its use a careful and experienced ploughman and a sufficient number of pickers can lift large areas very expeditiously at a lower cost than where forks are used, while less damage is done and fewer bulbs are left in the land. The smaller grower, however, must resort to the fork. The bulbs as lifted should be put in shallow trays or baskets, and placed in a cool, airy shed to dry, if such is available. If this shelter cannot be given them, they may be allowed to lie on the ground until they become dry and clean. They must not, however, be allowed to remain too long, in case they get scorched by strong sunshine. The length of time necessary must depend upon the condition of the bulbs when lifted, and the weather experienced, but once they are in a fit condition no time should be lost in getting them under cover, as, if showery weather sets in root-growth will very quickly commence, and this must be prevented. All lifting should be finished by the end of July at the latest.

The weight of produce lifted must necessarily depend upon the fertility of the soil, the variety grown, and the length of time the crop has been planted, but ten to twelve tons per acre may be regarded as an average yield, or about double the weight planted.

Preparation for Market.

Various methods of marketing are employed. Bulbs may be sold as lifted, large and small together, by the cwt. or ton, and many people (especially planters) prefer to buy their bulbs in this way. Retailers, however, and wholesale dealers who supply retailers, require first or second-sized shapely bulbs only. It then becomes necessary to clean and size the produce, making four different sizes, viz., first or "heads," seconds, thirds or "planting" size, and "chips." First-size bulbs of the popular varieties can be readily sold to bulb merchants by the 1,000, and the other sizes should be kept for planting purposes.

In growing for bulb production a more frequent course of transplanting is necessary than when bloom is the chief object, and nice, shapely bulbs, such as are wanted for shop sales, can only be obtained by regularly transplanting. When first-size bulbs are planted they multiply and give increased stock, and it is well to let such remain two or even three years undisturbed. Second-size bulbs, if carefully sized, should yield "heads" (or firsts) after one year's growth. Thirds and "chips" require two years before attaining saleable size, and then half only may be fit to be classed as "heads."

This sizing requires the exercise of some discretion, as by its careful performance much unnecessary labour may be saved. Thus the grower who sizes and plants what he hopes to lift as first-size bulbs after one year's growth incurs needless labour and expense if only 50 per cent. of the produce attains first size. A very little experience, however, will suffice for the alert cultivator, and he will be able to estimate from the bulbs planted what quantity of different sized produce he will have for disposal each year.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, APRIL 6.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Professor G. S. Boulger, Messrs. A. W. Sutton, J. T. Arkwright, E. M. Holmes, W. Hales, J. W. Odell, C. E. Shea, W. Fawcett, G. Massee, J. Douglas, F. J. Baker, H. T. Güssow, A. Worsley, J. Frazer, G. S. Saunders, and F. J. Chittenden (hon. secretary). Visitors: Messrs. E. Laxton and J. H. Drummond, F.L.S.

GUMMOSIS IN LEMON.—Mr. H. T. Güssow reported that the specimens of lemon shown by Mr. Worsley at the last meeting have been examined microscopically. After dissolving the gum in warm water at each of the places where the gum exuded, a wound was noticeable extending some way into the wood. The injured portions had no connection with each other, but were well defined nearly all round the stem. The distance between the two places where gum was seen oozing out was about 4in. The bark was peeled off, and some of the gum was transferred with a sterilised needle to a cover glass, and was diluted with distilled water. After drying and fixing the preparation it was stained for bacteria, and in every preparation a large number of them were revealed. The presence of the bacteria does not certainly prove that the gumming was caused by them, but the examination plainly showed that the injury could not have been due to some cause or other within the range of the root. Mr. Worsley kindly sent me the root and stem of the diseased lemon, and the roots were [illegible] to be perfectly healthy, with a good [illegible] fibrous and small rootlets; the stem [illegible] above the root showed next to a [illegible] injury which, according to additional information from Mr. Worsley, had first exhibited the gumming. The specimen examined was a seedling. It is frequently the [illegible] that bacteria gain entrance in the place [illegible] grafting, and cause profuse outflow of [illegible] in all kinds of stone fruits. A [illegible] of the organisms has been made, and [illegible] be used in infecting a young cherry [illegible] The bacteria isolated from cherries, [illegible] peaches, which showed gumming, [illegible] resemblance to those isolated from [illegible] lemon. The withering and flagging [illegible] the silvery appearance of the [illegible] leaves above the place of injury is [illegible] the natural result of the [illegible] vessels being clogged by the gum.

INHERITANCE OF CHARACTERS IN PEA SEEDS.—Mr. A. W. Sutton [illegible] a long series of preparations [illegible] seeds of plants raised by crossing [illegible] which he found growing wild [illegible] (? Pisum arvense) with forms of [illegible] vated garden pea (Pisum sativum [illegible] bicolor-flowered peas (Pisum arvense [illegible] Twenty-two crosses were made in [illegible] of these four were immature in [illegible] F1, and failed to germinate; four [illegible] before flowering in F1; seven flowered [illegible] produced no seeds; seven only produced [illegible] seeds in F2 (these latter are shown [illegible] 1 to 7). In most cases it would [illegible] the plants are almost or quite sterile [illegible] 8, 9, and 10 are the results of crosses

IRIS GERMANICA.

Supply the most beautiful and effective yellow, rose, purple, and blue blooms during May, June, and July.

To that great army of enthusiasts whose leisure is limited.

EASY culture and extreme hardiness, allied with bloom-producing qualities of the highest degree of excellence in colour, shape and size distinguish this collection of five. Where such a desirable combination exists, gardening becomes a REAL recreation, not an unwelcome extension of the day's work ; a minimum expenditure of time and labour is rewarded by a maximum of results.

Choose your own position for any one of the five. PLANT THE WHOLE OF THEM NOW in ordinary garden soil, and, without any heavy demand on your time or knowledge, next summer, and many summers to come, will see a living mosaic of glowing colours in your garden.

Coming from York Nurseries, the headquarters of hardy plant culture in this country, each plant is necessarily a picture of robust health, requiring only air, water, and a moderate amount of sunshine for development.

Send your order along to-day. Packing free for cash ; carriage paid on lots of 10/- or over in value.

Address ....

between the Palestine pea and Pisum sativum by Mr. Darbishire, and grown at Reading. They practically confirm our experiments. Mr. Sutton also exhibited a growing plant of the wild pea from Palestine, and a plant of Pisum quadratum (?) grown from seeds received from Kew. This plant much resembles the Palestine pea in all respects except the foliage. He also exhibited a collection of the various forms of seeds of the garden pea (Pisum sativum), and of bicolor blooming types (Pisum arvense), etc. Among the remaining cards showing the results of various experiments with peas, some showing that when Improved William 1st, with semi-wrinkled seeds, is crossed with a wrinkled pea, the resulting types of seed do not follow the Mendelian ratio of 3:1, were particularly interesting. This pea contains starch grains of similar form to those which are common to those found in round seeds, and not of the form found in wrinkled seeds, so that unless the wrinkled character of the seed was unconnected with the form of the starch grains the usual Mendelian ratio could scarcely be expected. Mr. J. H. Drummond showed a series of specimens from his own herbarium and from the herbarium of the Royal Botanic Gardens, by the courtesy of the director, showing that the plant Mr. Sutton had collected in Palestine was in all probability Pisum humile of Boissier, and not Pisum sativum or P. arvense (as, indeed, its behaviour on crossing appeared to show too).

WILD SPECIES OF ASPARAGUS AND RHUBARB.—Mr. Sutton also exhibited plants of asparagus (propably Asparagus filicinus) and rhubarb (apparently Rheum Moorcroftianum) sent him from the Punjab by a correspondent. The roots of the asparagus were tuberous, and were no doubt organs in which water was stored. The young leaves of the rheum were cup shaped, the leafstalk springing from the base of the cup.

HIPPEASTRUM HYBRID.—Mr. Worsley showed a flower of a deep dragon's blood red, a first cross between the two species Hippeastrum aulicum and H. vittatum. The flower is of very good form and splendid colour.

POLYSTICHUM SP.—Mr. J. Fraser showed specimens demonstrating the resemblance between Polystichum lobatum, Presl., and P. Lonchitis, Roth. If the pinnæ of the latter were lobed or lobulate instead of being merely serrated, the two forms would be closely similar, judging from the size and form of the pinnæ in the two cases. The comparison between Polystichum lobatum, Presl., and P. aculeatum, Sw., was less obvious.

SEED FROM SOUTH AFRICA.—Mr. E. M. Holmes reported that the seed exhibited by Mr. Veitch at a recent meeting was Voandzeia subterranea, often called Bambarra ground nut, and used in tropical and South Africa as food.

MALFORMED ORCHIDS, ETC.—Mr. J. W. Odell showed some malformed orchids which will be reported on at the next meeting, and some flowers of auricula wherein the stem of the stamens were becoming transformed into petals, thus showing the beginning of a double flower.

DENDROBIUM HYBRIDS. — R. G. Thwaites, Esq., Streatham, sent flowers of Dendrobium Thwaitesiæ x D. Wiganiæ xanthochilum, both being white with a zone of purple on the disc of the lip. He wrote: "Of the first three have flowered like those sent, and of the second six plants have flowered. You will notice the pollen caps and stems are also white. I feel sure it would be quite useless to use those flowers for obtaining white hybrids, and it may be that the unsuccessful attempts to obtain white flowers (hybrids from apparently white parents) is due to coloured parentage somewhere behind the flowers used. These and other results, though apparently confusing, may later on assist in throwing light upon the albinism question, as notwithstanding the mass of contradictions which are appearing, I feel sure there is some logical law relating to it." D. Wiganiæ is a hybrid between D. nobile and D. signatum, D. Wiganiæ xanthochilum being a seedling out of the same pod, while D. Thwaitesiæ represents the result of further crossing D. Wiganiæ and D. Ainsworthi (nobile x aureum), so that the original parents are all either purple or yellow flowers, and the cause of the peculiarity is not apparent.

Bournemouth Gardeners' Association.

On April 6 "A Chat on the Cyclamen" was the subject of a very interesting and instructive lecture given by Mr. F. Lever, of Bournemouth, before a good attendance of members. Mr. Geo. Garner, Delamere Lodge, Bournemouth, presided.

Mr. Lever did not attempt to treat the subject exhaustively, but gave very useful hints on the most salient points in connection with the successful cultivation of the cyclamen. He strongly advised sowing the seeds before November where it was not possible to maintain a winter temperature of at least 70 deg., but where this was possible he recommended November sowing; then the resultant plants would make strong specimens for flowering during the following winter and spring months a year hence.

His method of sowing the seeds was, to drop them singly on the smooth, sandy surface of the prepared compost at a distance of one inch apart, and then gently press them into the soil with the end of a lead pencil. The necessary watering afterwards would wash in the sand and sufficiently cover the seeds. Equal parts of loam and leaf-soil, with a free admixture of sharp sand, was the compost recommended, and the lecturer preferred pans to boxes because of the moisture connected with the former.

Mr. Lever recommended sowing the seeds in September to produce flowering plants the following autumn, or to depend upon two-year-old plants, which he preferred. For the final potting, some old mortar rubbish, with a 5-inch potful of bone-meal, should be mixed with the compost, and the potting done fairly firmly.

Mr. Lever believed in dipping in fir-tree oil as a remedy for thrips, and also syringing the foliage with soot water as being very beneficial to the health of the plants. The resting of the plants, said the lecturer, should commence in June, and last for two months. His system was to place the pots on their sides on the north side of a wall.

Many members showed much eagerness to take part in the discussion which followed the lecture. Mr. C. Nippard, Ashton Court Gardens, advised the plants being rested in the sunshine and well baked, and had had good results from this treatment; but this system did not find very much favour with the members present. How to treat the ripening seeds, and especially those of the crested varieties, feeding, housing, gathering the flowers, and other matters, were freely discussed, and the lecturer replied in a very satisfactory manner to the many questions put to him.

Hearty votes of thanks to Mr. Lever, and the Chairman, concluded a most enjoyable and instructive discussion.

Reading Gardeners' Association.

The usual fortnightly meeting of this association took place in the Abbey Hall on Monday, April 4, when the chairman, Mr. A. F. Bailey presided over a good attendance. The lecturer for the evening was Mr. H. C. Loader (vice-chairman), who presented a very carefully-prepared paper, "Our Association: Some of its Advantages," which was delivered in the forcible and convincing manner characteristic of him, and his remarks frequently evoked considerable applause. In enumerating the advantages of such a society, Mr. Loader dwelt on the great opportunity for improvement the younger members who chose to grasp it had enjoyed by being present at Mr. Charles Foster's classes for young gardeners, which had been so successfully conducted and so well at[illegible] during the past six months. By their [illegible] lar appearance at the fortnightly meeting the older members showed that they too [illegible] desirous of refreshing their memories, as [illegible] as giving others the benefit of their [illegible] ence. Mr. Loader spoke of the association [illegible] a huge partnership, the object of which [illegible] the promotion by the members to the [illegible] of their ability of horticulture in [illegible] branches.

In the discussion following the paper [illegible] members bore eloquent testimony to the [illegible] of the lecturer's remarks, and also to the [illegible] vantages they had reaped as members of [illegible] association. At the conclusion of the [illegible] ing a hearty vote of thanks was accorded M[illegible] Loader.

The society's certificate of cultural [illegible] was awarded Mr. H. Goodger, head gardener to Mrs. H. Collins, Stoneham House, [illegible] for a group of Sutton's Star cinerarias. M[illegible] F. Townsend, gardener to the vice-president, exhibited—not for certificate—a splendid collection of narcissi, which was greatly admired.

Bristol Gardeners' Association.

The last meeting of the session was [illegible] on April 8 at St. John's Parish Rooms, pre[illegible] sided over by Dr. Barclay Baron. Mr. [illegible] H. Cave gave a very interesting lecture upon "Daffodils," which, in the words of [illegible] chairman, was delivered with complete [illegible] knowledge, and enthusiasm. The [illegible] dealt very minutely with his subject, and gave many useful hints, under the [illegible] divisions—soil, aspect, planting, and [illegible] naturalising, cutting, and packing, hardiness and powers of increase, and hybridising. [illegible] the course of his remarks, Mr. Cave said [illegible] lifting should be done in July, and [illegible] planting finished by the end of August. [illegible] also gave a comprehensive list of [illegible] suitable for various purposes. Mr. [illegible] an enthusiast where daffodils are [illegible] and has raised many choice seedlings, and of these two were exhibited, one [illegible] miniature Sir Watkin. The lecturer [illegible] lises several hundred every year. Dr. [illegible] Baron proposed a vote of thanks to Mr. [illegible] and Mr. Shelton proposed one to the [illegible] man, and both were enthusiastically [illegible] For two pots of schizanthus, Mr. H[illegible] first, and Mr. Candy second. An [illegible] certificate went to Mr. Venn for a [illegible] dium.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Horticultural [illegible] Vincent Square, S.W., on Monday, A[illegible] Mr. Thomas Winter in the chair. [illegible] members were elected. The usual [illegible] payments were made, and several [illegible] over sixty years of age availed [illegible] the opportunity to withdraw their [illegible] per rule 18. The annual report and [illegible] sheet has been posted to members [illegible] member not having received one [illegible] write to the secretary, Mr. W. [illegible] Martindale Road, Balham.

FORTHCOMING ENGAGEMENTS.

ANSWERS TO CORRESPONDENTS.

VACANT LAND CULTIVATION SOCIETY.—M. E., Kingston: The secretaries of the Vacant Land Cultivation Society are Messrs. E. G. Culpin and J. Fels, and the offices of the society are at 39, Wilson Street, London, E.C.

DAHLIAS. — J. C. S., Margate: Where early propagation has been practised the great mistake so often made is that of allowing the plants to become hard stemmed, and more or less starved before planting time comes. The plants should be potted at once and kept in a cool pit or house, quite free from frost, and there they will grow steadily and root freely. Where dahlias are to be a feature of the garden, the plants ought to be in six-inch pots, with stems as stout as one's finger, and about fifteen inches or so high by the beginning of June. Such examples continue to grow away, and they come early into bloom, and continue flowering until frosts cut them down. We certainly advise you to grow some of the pæony-flowered varieties for garden decoration in positions that are not too exposed to wind.

HANDY DICTIONARY. — S. W. J., Chelmsford: The handiest gardening dictionary we know is the "Encyclopædia of Gardening," post free, 3s. 10d., from Messrs. W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.

A GOOD DWARF BLUE ANNUAL. — G. J., Peterborough: For your particular purpose we recommend the pretty and useful Phacelia campanularia, a charming Californian annual that grows about eight inches high, and produces bell-shaped flowers of the richest blue colour. These flowers are borne in racemes, and the plant does best when in a warm situation, and in rather dry soil. The fine compact habit of the plant makes it specially suitable for bedding. Sow at once in light soil, and only just cover the seeds, place the box or pan in a warm house or pit, and place a sheet of glass over it, and give shade until germination ensues. After this, pricking off and hardening the seedlings as for other annuals raised in heat, must be followed. While under cover keep the plants near the glass to ensure dwarfness and compactness.

LARGE-LEAVED SUBTROPICAL PLANT.—C. P., Launceston: In addition to the subjects you enumerate, we suggest Weigandia macrophylla, sometimes known as W. caracasana. It makes a very fine bold foliage plant, and will grow 10ft. high. It is rather late to propagate this useful subject from seeds now, but if you have convenience to keep plants in a stove temperature until the beginning of June, it is worth while sowing a few seeds at once. Light loamy soil, and plenty of light and heat will enable you to produce plants of considerable size by that time, and then a little hardening off before planting out will suffice. In the autumn raise a few plants by means of cuttings, pot these up when well rooted and keep them in a warm greenhouse until the following summer; by this means you will secure splendid examples for next season.

COLOUR CHART FOR FLOWERS. — F. G., Woking: You are evidently not a Fellow of the Royal Horticultural Society, or you would know that Fellows can obtain the "Repertoire de Couleurs," or Colour Chart, through the society, for 15s., post free, whereas the published price is £1 1s. net. We have badly wanted for a long time a colour standard for naming, recognising, or indicating to others, the exact shade of colouring in any flower in which we are interested. This chart, arranged by the French National Chrysanthemum Society, provides such a standard, and we believe that in a few years' time—we are slow to move in these matters—it will become generally used for the description of florists' flowers. The present style of popular description will not necessarily be dropped altogether, but it will be accompanied by a reference to the colour and shade to be found on a certain page of the "Repertoire de Couleurs." If you do not care to join the R.H.S., you can obtain the Colour Chart through any Fellow of your acquaintance, and, failing such acquaintance, we will obtain a copy for you on receipt of 15s.

CHICORY AS GREEN SALAD. — A. M., Hertford: Although chicory is most valued during winter and early spring, when roots produced the previous season are forced in a warm dark place, and make succulent leafage, this is by no means the only use to which it can be put. Where salading is in great demand, and it is necessary not only to maintain a supply, but also to secure as great a variety as possible, chicory may with advantage be pressed into service. For this purpose small beds should be made at intervals of three or four weeks from spring till autumn, and on these the seeds should be sown thickly, in shallow drills. The fresh young leaves should be picked as needed.

ORACHE OR MOUNTAIN SPINACH.—S. S., Ulverston.—It is entirely a matter of taste, and we think you should attempt the cultivation of this greenstuff, rather than oppose its use and press the claims of garden spinach. You are not, we take it, likely to be debarred from growing the latter, and it seems unwise to raise obstacles in the way of a crop that you have no knowledge of, and for which a wish has been expressed. Orache or Mountain Spinach (Atriplex hortensis), is closely allied to the spinach, and is sometimes used as a substitute for it. It is a hardy annual, and hails from Tartary. Seeds may be sown at any time from March to September, in rich soil, in drills an inch deep, and two feet apart. Sow thinly, and thin out the resulting plants to a foot or fifteen inches apart. Give good soakings of water during dry weather, and pinch out the flower spikes as they appear. There are white, green, red, and dark red varieties, and the coloured forms are quite decorative; the colouring all disappears during the process of cooking.

NUTTALIA CERASIFORMIS.—A. G. N., Cirencester: You are quite right, the plant is Nuttalia cerasiformis, a Californian shrub that is always interesting in the early spring time, and one that does not lack beauty of a modest kind. In outward appearance it does not suggest an affinity with the big rose and apple family, but, nevertheless, it belongs to the great order Rosaceæ. Propagation is a quite easy matter, and sometimes one can obtain imported seeds. Failing these it may be increased by layering the lower branches, by carefully removing and transplanting the sucker-like growths that push up from the roots, or by means of cuttings of half-ripened shoots inserted in sandy soil and placed under a hand-light. As you are not likely to need many plants, we suggest layering as a suitable method of increasing your stock.

NAMES OF PLANTS.

E. H. G., Weymouth.—1, Sciadopitys verticillata; 2, Cupressus macrocarpa lutea.

W. J., Hendon.—1, Salix Caprea; 2, Iris reticulata; 3, Saxifraga apiculata; 4, Leucojum vernum.

M. L. A., Oxford.—1, Cydonia japonica; 2, Forsythia suspensa; 3, Erica herbacea; 4, Adonis Amurensis.

B. C. W., Chesterfield.—1, Saxifraga apiculata; 2, Clianthus puniceus; 3, Boronia heterophylla; 4, Acacia armata.

A. G. O., Keswick.—1, Dendrobium Pierardi; 2, D. Bensonæ; 3, Cymbidium Lowianum—a good variety; 4, Dracæna Godseffiana.

N. D., Torquay.—1, Narcissus triandrus; 2, N. cyclamineus; 3, Odontoglossum triumphans; 4, O. cirrhosum; 5, Phalænopsis Schilleriana, a very poor form.

CATALOGUES RECEIVED.

CHARLESWORTH AND CO., HAYWARDS HEATH.—A large and excellent catalogue of orchids, and one in which hybrids are particularly well represented. This firm has now removed its entire stock from Bradford to Haywards Heath, and the illustrations in the new catalogue show the extent and very fine arrangement of the new nursery, and also give an idea of the beauty and interest of the wonderful collection of plants grown at Haywards Heath.

BOULTON and PAUL, Ltd., Dept. M5, Norwich.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Improved Metal

VAPOUR CONE FUMIGATOR,

At Greatly Reduced Prices.

INTRODUCED 1885.

This well-known invention for the entire eradication of all pests infesting vegetation under glass is now manufactured in a more simple and reliable form. The small candle (which will be found packed with each Cone) has only to be lighted, and placed on the ground in the centre of the Cone Frame, to produce immediate results. Nothing in the market can equal it for efficacy and cheapness.

Cone No. 3, for a well-secured house of cubic 2,000 to 2,500 feet, 1/- each.
Cone No. 2, for a well-secured house of cubic 1,000 to 1,200 feet, 8d. each.
Cone No. 1, Carbon, for frames of cubic 100 feet, 6d.

Full Directions accompany each Cone.

Ask for a list of Testimonials, of which some hundreds have been received from the leading Gardeners in the Kingdom.

To be had from all Dealers in Horticultural Sundries throughout the Kingdom.

AN APPEAL TO THE GARDENERS OF GREAT BRITAIN.

MANY Professional and Amateur Gardeners are aware of the fact that a fight has been going on for years between the Traders in Poiso Compounds Protection Society and the Pharmaceutical Society in reference to the sale of poisonous compounds used in horticulture. The Act, known as "The Poisons and Pharmacy Act, 1908," came into force on April 1st of this year, and Clause 2 reads as follows:—

2. In granting licences for the saleof poisonous substances for use exclusively in horticulture, preference shall be given to nurserymen, florists, seedsmen, and other persons whose business is specially connected with horticulture.

The only correct construction which can be put upon this clause is that it was the intention of the Government that the Borough and County Councils should grant licences to Nurserymen, Seedsmen, Florists, etc., who have been accustomed for very many years—in fact, ever since the articles were introduced—to supply Nicotine Vaporising Compound, Nicotine Insecticide, Weed Killer, etc., etc.

As a matter of fact, they have always held the trade for such poisonous compounds as these, and the gardening public have always sent their orders to them.

The Chemists' Associations all over the country have done their best to bamboozle the licensing authorities by making mis-statements to the effect that they, and not the Horticultural Trade, have been doing this business, and that there is no necessity to grant licences to the Horticultural Trade. Now, as the largest manufacturer of poisonous compounds (XL ALL) used in gardening, I appeal to professional gardeners not to place a single order with a chemist.

There is no question that the sympathy of Professional Gardeners will be with their own fraternity, and I shall be much mistaken if Gentlemen Amateur Gardeners who buy these kinds of articles themselves do not take the same view of the situation. Such mercenary greed on the part of the pharmacists, to rob horticultural tradesmen of the business which they have created and introduced to the public should be beneath the action of professional men.

PHARMACY FOR THE PHARMACIST! TRADE FOR THE TRADER!!

I wish to explain to gardeners and amateur gentlemen buyers that should their Nurseryman, Seedsman, or Florist be denied a licence for the time being, they can, all the same, legally book orders for XL ALL poisonous preparations, to be sent on by the manufacturer; and still further, they can legally invoice the goods and receive payment for same. Very little delay will be caused by having to follow this course and I trust that gardeners generally will show their disapproval of the mean and contemptible action of the pharmacists of Great Britain by not placing orders with them.

NOTES OF THE WEEK.

Water Gardening.

Within recent years there have been many changes in public taste in its relation to the garden, and of these not the least important has been the fuller appreciation of the beauty and interest of moisture-loving plants. As a consequence of this change water gardening has become an essential feature of horticultural practice and both aquatics and sub-aquatics are systematically cultivated in large numbers of gardens. From time well-nigh immemorial these plants have had a place in British gardens, and we should have to go far back to find a time when the white water lily could not be seen floating on the placid surface of lake or pool within the pleasure grounds, and masses of meadow sweets, lythrums, and other bog plants did not contribute their share to the attractions of slow-running streams that intersected the ornamental parts of the garden. But not until within a recent period have the representatives of the water and bogland flora been freely utilised in the creation of garden scenery, and so arranged as to display their distinctive characteristics to the best advantage. The change that has taken place in the views held with regard to the cultural requirements of these plants is not less deserving of mention than is the fuller appreciation of their many merits. Water lilies were from time to time planted in lake and pool, and if they failed to become established they were, in some cases, replaced, while in others it was assumed that the conditions were not favourable to their successful culture, and nothing further was done. If, on the other hand, the water lilies became established, and grew vigorously, they were allowed to remain until the growth became so dense as to render the removal of masses of vegetation imperative. Now, those who have had experience in this phase of gardening persevere until they are successful in establishing healthy colonies of water lilies and the other subjects that may be associated with them: and are careful to pay due attention to the all-important detail of thinning. Water gardening is unquestionably a quite modern innovation, and when carried out on proper lines adds so appreciably to the attractions and interest of the garden that there is ample justification for a strong feeling of satisfaction that it should have attained to so high a degree of popularity. Mistakes have been made in some instances, and others will doubtless be made before the water garden has reached the high state of perfection that is desired by all who are actively interested in it and its occupants. This, however, is by no means surprising, considering how varied are the plants in their habit and cultural needs, and how difficult it is to grow them successfully and arrange them effectively, until the cultivator has, with the aid of expert advice, become acquainted with their peculiarities. Appreciating the importance of fuller information upon water gardening than is readily available, we felt that we might, with advantage to our readers, give special attention to the more important points relating thereto, and have been so far successful in giving practical effect to our views, that our readers have at their command full information on all the more important points relating to its planting and management. There is no occasion that we should deal in detail with points so fully dealt with elsewhere, but it is a matter of some importance that we should direct attention to the necessity for care in selecting the site for the water garden; also to the importance of adopting a design that is suited to the site. The informal water garden is unquestionably the best for the cultivation and the tasteful display of a comprehensive collection of aquatic and bog plants, but it should not, as is sometimes done, be constructed at a heavy cost on high ground. Nature should be imitated, and a low part of the grounds be selected for the water garden, and the site be laid out in as natural a manner as possible. Ample provisions must be made for a selection of the finest of the nymphæas, and as these require a considerable area, and a good depth of water, it will be an enormous advantage if the garden can be associated with a natural lake or pool. In any case, a site where water is plentiful, or is readily obtainable, should be taken advantage of. In all cases overcrowding the water and its margin should be avoided, for, unless the lilies are sufficiently far apart to allow a water space between them, the effect is far from pleasing. In like manner the plants growing on the margin should be arranged in groups, with space between them, so that the lilies and other plants growing in the water can be readily seen. There is yet another point that should have consideration in the formation of a bog garden, and that is the provision of stepping stones, resting upon a firm foundation, to admit of the examination of the plants grown therein with some degree of comfort. Sometimes the stones are put too far apart and in other cases they are laid on the surface, with the consequent risk of the unwary visitor finding himself or herself ankle deep in mud when enjoying the

MR. J. W. ODELL.

charms of some object that is especially attractive. The formal water garden, if less suitable for the cultivation of a comprehensive collection than one in which informality reigns supreme, is of considerable value, inasmuch as it admits of the cultivation of nymphæas and other subjects in positions where informality would be quite out of place. It may, perhaps, be well, in conclusion, to sound a note of warning, to the effect that in water gardening, as in other matters horticultural, it is important to avoid attempting too much, and to remember that a comparatively small area carefully managed will give far more pleasure than will one so large that sufficient time cannot be devoted to it.

Mr. J. W. Odell has so long occupied a prominent position among practical horticulturists, and has, moreover, accomplished such excellent work in various directions, that a large number of our readers will be interested in his portrait, which we have the pleasure of giving in this issue. Mr. Odell has for upwards of twenty years had charge of the gardens and farm of The Grove, Great Stanmore, and, among other matters of special interest associated with his career, previous to his entering on his present charge, may be mentioned the laying out and planting of a large area of fruit land in Florida, on behalf of an American fruit growing syndicate. While possessing great cultural skill and administrative ability, as exemplified by the success he has achieved in the management of the gardens and farm under his charge, Mr. Odell possesses scientific attainments of a high order. He has devoted much attention to the study of British plants, and the paper he read, not so long since, before the Royal Horticultural Society on wild flowers in relation to the garden was of special interest. Mr. Odell was for some years a member of the Orchid Committee of the society mentioned, and during the past eight years has been a member of the Scientific Committee. While devoting close attention to the practical and scientific aspects of gardening and farming, Mr. Odell has fully recognised his responsibilities as a citizen, and taken a keen interest in local affairs, and that he is highly esteemed in the district is evidenced by the fact that for twelve consecutive years he has occupied the position of chairman of the Great Stanmore Parish Council.

Flower Imports in March last were of the value of £35,177, as compared with £35,185 and £42,611 in the corresponding month of 1908 and 1907 respectively. For the first quarter of the year the value of the imports of flowers was £97,812, which is the largest sum that has been paid in a similar period for flowers of foreign growth for several years past. This increase for the first three months of the year is surprising, considering the large extension of flower production in this country within recent years.

Census of Fruit and Vegetable Crops.—Information is being collected by the Board of Agriculture as regards market garden crops, crops grown under glass, and the production of fruit. Information is desired, not only as regards the ordinary field crops, but also as regards vegetables (cauliflowers, celery, mustard, mint, etc.), tomatoes, flowers grown for market, grass seeds, watercress, the produce of nursery gardens, etc., etc. In the case of small areas on which a great variety of produce is grown, which cannot be separately distinguished, the total value is asked for; but, generally, the information is desired in as much detail as is possible. Growers of crops under glass are asked to state the amount and value of grapes, peaches, tomatoes, cucumbers, and other kinds of fruit, flowers, and vegetables so produced. Fruit growers are desired to give the area, production, and average yield of strawberries, raspberries, currants, gooseberries, and other kinds of small fruit, and of apples, pears, cherries, plums, nuts, and other kinds of orchard fruits. In addition, occupiers are asked to state the number of persons temporarily employed in fruit picking during the season, showing the number employed for small fruit and orchards.

Open-air Bulb Show at Hillegom.—The thirtieth annual exhibition of the Hillegom section of the Dutch Bulb Growers' Society was opened by the Burgomaster of Hillegom in the Hof Gardens on April 8, but, owing to the lateness of the season, few flowers were open on that date. The show promises to be a very fine one between April 20 and May 8, as the flowers will be at their best during that period.

French Gardening at Evesham.—Mr. James Udale writes thus of "French Gardening" in the current issue of the "Journal" of the Royal Agricultural Society: "La Petite Culture" under frames and bell-glasses, or "French Gardening," is the same system whereby the old English gardener produced all his early vegetables and salads under frames set on heaps of fermenting material. The writer had his first practical experience of the system in 1865, and practised it continuously till 1871. Since then "glass" has got cheaper, hot-water apparatus have been developed, and so the more or less uncertain hotbeds have been replaced by hot-water heated frames, pits, or low-roofed glass-houses. It may be remarked that a "French Garden" is not a piece of ground entirely covered by frames and bell-glasses, but that the amount of land so covered is equal to about one-fourth of the total area; the glass being moved from quarter to quarter or plot to plot, as the various successive crops require protecting. So far as I know, there is but one bonâ fide "French Garden" at Evesham, but I believe the nucleus of a second one has been formed. Considering that a large number of Evesham gardeners were taken to Paris several years ago with the special object of stimulating them to copy the French gardeners, and incidentally to show to them (the Evesham men) their backwardness and shortcomings, it is significant that the Frenchmen have had practically no imitators in the Vale of Evesham.

Window Gardening in London.—In a communication from Lord Meath having reference to the encouragement of window gardening in the poorer parts of the Metropolis, his Lordship states that during the past four years the Metropolitan Public Gardens Association has been making a strenuous effort to encourage the formation of outside window gardens in the poorer streets of London. The object in view has been to relieve the great monotony of many of these thoroughfares by inducing the occupiers to grow plants, flowers, creepers, etc., in boxes, pots, or baskets outside some of their windows. It is astonishing what a transformation is effected by even a few such efforts on the part of the inhabitants, which change the whole aspect of a dull street and gladden the eye of every passer-by. Many of the thoroughfares are too narrow for trees, so no other form of foliage is possible, but even where trees do exist the window gardens are a most desirable addition. The association has therefore started prize competitions in various centres, obtaining the assistance of some suitable organisation in the vicinity to arrange local details. Last year there were 30 centres (chiefly situated in the central, eastern, and south-eastern parts of London), 800 entries, and 21 prizewinners, entailing an outlay of some £30. The results were considerably in excess of those of 1907, and the association is prepared to go on.

Prizes for Forced Hyacinths in 1910.—The Council of the Royal Horticultural Society have accepted the offer of the following prizes, to be competed for in March, 1910, from the Royal General Dutch Bulb Growers' Society at Haarlem. For amateurs and gentlemen's gardeners—Eighteen hyacinths, distinct: 1st prize, £6 6s.; 2nd prize, £5 5s.; 3rd prize, £4 4s.; 4th prize, £3 3s.; 5th prize, £2 2s.; 6th prize, £1 1s. Twelve hyacinths, distinct: 1st prize, £5 5s.; 2nd prize, £4 4s.; 3rd prize, £3 3s.; 4th prize, £2 2s.; 5th prize, £1 1s. Six hyacinths, distinct: 1st prize, £2 2s.; 2nd prize, £1 10s.; 3rd prize, £1 1s.; 4th prize, 10s. Four pans, containing hyacinths, ten roots of one variety in each pan, the blooms of each pan to be of distinctly different colour to those of the other three pans: 1st prize, £4 4s.; 2nd prize, £3 3s.; 3rd prize, £2 2s.; 4th prize, £1 1s. For trade growers—Collection of 200 hyacinths in at least 36 varieties, grown in pots or glasses: Prize, the gold medal of the General Bulb Growers' Society at Haarlem; collection of 200 hyacinths in 20 varieties in pans, 10 roots of one variety in each pan: Prize, the gold medal of the General Bulb Growers' Society at Haarlem. In the first three classes each bulb must be in a separate pot, size optional. In the first four classes all must be single spikes; no spikes may be tied together. Exhibitors may only compete in one of the first three classes. All bulbs must have been forced entirely in Great Britain or Ireland. The bulbs used in pans and in the last class should be of varieties most suitable for outdoor bedding purposes.

Tweedside Alien Plants.—At the monthly meeting of the Edinburgh Botanical Society a paper by Miss J. M. Hayward, on "Tweedside Alien Plants," was read. Miss Hayward stated that the banks of the river Tweed are especially rich in alien plants, no doubt owing to the river and its tributaries flowing through so many wool manufacturing towns. The wool and sheep skins carry seeds picked up in their native countries, which become detached in the processes of washing and cleaning. These seeds find their way, to some extent, into the rivers, and, becoming lodged in congenial soil on their banks they take root and grow. In that way wool introductions are found on the deposits of alluvial soil and on the shingle banks, and plants, natives of Australia, New Zealand, South America, and other countries, are found growing and flourishing for a considerable way along the banks of the river Tweed below the manufacturing towns. In the course of 1908 Mr. James Fraser and Miss Hayward found altogether 130 different species of alien plants in the neighbourhood of Galashiels, 68 of which had not hitherto been recorded as growing on the banks of the Tweed and its tributaries.

National Auricula and Primula Society.—The Midland Section of this society has notified the alteration of its show date from April 28 to May 5 and 6.

ON METHOD IN GARDENING

Mr. Strugnell's remarks in the last paragraph of his comments on "Facts about Gardenias" that recently appeared in the Gardeners' Magazine, incidentally illustrate how important a thing it is, in order to be successful in following gardening pursuits, to have adequate resources, accompanied with sound methods. The two modes of growing the gardenia described by your correspondent amply verify this. In one case, the necessary means for the plants' requirements were provided, and they were skilfully employed by the cultivator; while in the other, the cultivator with respect to his plants, appears to have been placed in a common and unenviable position—that of having to attempt to successfully cultivate under identical conditions a variety of subjects that demand in some respects widely different treatment from each other.

Mistakes in cultural methods are probably more commonly made in the case of plants that require glass protection than in any other department of horticulture. Collections of miscellaneous subjects that need very different treatment in the manner of atmospheric moisture, temperature, light, shade, etc., may be seen placed together, and subjected to the same conditions, and each is expected to succeed. This state of things may be either the fault of the gardener or his employer; but, whatever the cause, no really good results can come from it. It is futile to expect to achieve high-class cultural attainments with subjects of any description, whether flowers, fruits, or vegetables, unless proper methods are adopted, and it is far better to be satisfied in cultivating well what may be termed commonplace things, for which the means are at command, than it is to grow badly higher-class subjects, owing to attempting their culture with inadequate means. Nevertheless, it is only just to admit that great credit is due to individuals who surmount great cultural difficulties, though it may not always be worth the trouble, especially when the sacrifices thus sometimes made are taken into consideration.

T. Coomber.

The Hendre Gardens.

INFORMAL WATER GARDENS

The informal water garden should not be too near the house, neither should it be in too close proximity to any part of the formal garden. Those who have running through their grounds a brook or streamlet have just the place in which to start a garden of this interesting character. As a great many of our most effective and most graceful hardy plants can be grown either in the water itself or in the moisture-laden margins of a pond or brook, it is surprising that more advantage is not taken of this fact when the opportunity occurs. Even where natural ponds exist, it frequently happens that the banks of the pond, as well as the water itself, are either perfectly bare, or are covered only by the rankest weeds. The margins of these brooks or streams offer to lovers of hardy flowers a site easily made into a garden of pleasure.

Some who have hitherto used such places for aquatic plants only, and of these latter only a very meagre selection, have missed much of the pleasure that might have been enjoyed if they had only used some of our vigorous hardy flowers. Many of the finest plants, from irises to globe flowers, thrive in moist soil, and these bank plants have the advantage over water plants that we can fix and limit positions, whereas water plants spread so much that some kinds overrun others.

Many of the following types of hardy flowers will grow freely near the water-side: Meadow sweets, tall irises, day lilies, the rosy loosestrife, golden rods, star-worts, monkshoods, giant knot-worts, moon daisies, the cardinal flower, and the lupins. With these hardy plants, too, may be associated some of the hardy ferns, such as the Royal Fern and Feather Ferns.

In shady nooks by the waterside, Primula japonica and P. sikkimensis delight. Here also the blue Himalayan poppy (Meconopsis Wallichi), the tall yellow Gentiana lutea, and the bright blue Mertensia virginica will flourish, as well as the Saxifraga peltata. Here, also, Solomon's Seal and Trillium grandiflorum will be at their best. There are a number of other suitable plants for the water garden and its surroundings, especially if we include those subjects generally known as bog plants, which, however, are perhaps more suitable for the bog bed in the rock garden than the margins of ponds or streams, but enough plants have been enumerated to show that we have a great variety to pick from for the informal water garden.

AN INFORMAL LILY POOL IN AN IRISH GARDEN.

But, alas, how often one sees mistakes made by the water-side, such as the use of variegated shrubs, the too frequent planting of bushes like the yellow elder and the purple beech. These are all very well in their place, but when we find variegated shrubs growing down to the very margin of the water, it is, to my mind, the worst kind of vegetation that could be chosen for such a place.

T. B. Field.

Ashwellthorpe Gardens.

Pentstemon barbatus Torreyi.—Mr. Smith draws attention to this pentstemon, and describes it as bright scarlet in colour. This colour I have never found in the variety Torreyi. Mine has always been a dull, faded red, not in any way bright, let alone scarlet. The type, as I grew it twenty years ago, was much brighter in colour, but this appears to have become less known, and as the newer P. b. Torreyi is so easily raised from seed, we do not see the latter form so much.—E. M.

THE PLANTING OF WATER MARGINS.

A careful review of many British water gardens of every description, that one has visited during the past 20 years, prompts a warning note as to the great desirability of evolving something distinct from a mere flower garden—something restful as a woodland scene, giving colour in a limited degree only, and wealth of foliage in a greater.

The water gardens of our fathers were, either the moat in which water-lilies almost solely were grown; the broad lake, tree-girt, and but partly exposed- such as one now finds in our largest parks—or the ornamental tank of worked stone, still a feature of the Italian school of garden designers.

Latterly has arisen a decided trend in gardening taste towards informality. The apparently irresistible desire to project into the region of park, copse, and waterside brighter features than of yore, has rendered it possible to use effectively many beautiful plants, culturally at home there, each being a fitting associate of the other and of the surroundings. In the planting of water margins there is danger to any effective design by including among the proper plants for such a position a lot of rejects from the garden proper; too often the water garden commences with what the garden proper has to spare. Here is a bad beginning. No amount of skill can group these garden rejects in a way that will present the picture of an ideal water garden. The grander the scheme the simpler and bolder must be the grouping.

In the smaller water gardens it is permissible to plant hundreds of representatives of water-loving flora, for nothing is here attempted to accord with breadths of landscape; it is when this system of including everything the nurserymen have to offer in units, twos or threes, upon the banks of broad expanses of water, that indefinite and mainly uninteresting water gardens result.

In our national gardens at Kew there is a good example of artistic and well-balanced grouping on the banks of the great lake. Here are colonies of spiræas, colonies of irises, colonies of bamboos, rifts of Sea Buckthorn, Giant Saxifrage, and a limited number of groups of other waterside plants, British and cultivated, all intersected by areas of turf which dip to the water's edge. The arrangement is such that every feature of the lake is available to view from many points of vantage.

One can suggest as a useful guide in the planting of water gardens, two-thirds of the surface of water should be unplanted, two-thirds the area of its margins should be planted. Experience teaches that this proportion gives the best results in the case of quite informal lakes, the broader area of unplanted water providing a mirror for the banks.

Lake Margins and Riverside.

Whilst the principal plants for waterside grouping will be mainly subaquatic and bog plants, a means of well separating these and diversifying the scenic effect will be found in a few groups of trees and shrubs that could occupy the higher banks and the water's edge also. These groups will give needful shelter to astilbes, the larger calthas, Giant Saxifrage, and other plants liable to injury by late spring frosts, and the clever planter will group tree, shrub, and herb in a way showing each to be helpful to the other culturally and artistically. For the higher levels can be recommended the big-flowered magnolias, whose flowers and foliage seem destined to grace waterscapes. Spiræas Lindleyana and Aitchisoni—both spreading shrubs, with handsome flower panicles. Viburnum plicatum and lantana, Hydrangea paniculata, Rubus deliciosus, and as many of the taller bamboos as one cares to plant.

Connecting this zone of trees with the landscape will be the common forest trees of the English park, and among these should be a group or two of the common larch and English oak for their wonderful leaf colouring in spring.

Where moisture occurs in appreciable quantity a different type of tree may be planted. The common willow, the Kilmarnock willow, Pseudotsuga canadensis, hornbeam, Sea Buckthorn, the lesser bamboos, such as Arundinaria nitida, Phyllostachys mitis, and those pretty drooping ones that look so well dipping to the water's surface—Phyllostachys Henonis, P. aurea P. nigra, and castillonis, to name a few. Grouped here, also, one may have phormiums, Polygonums Hererichi, chinense, and polystachyum, giant fennels, bocconias, and the Provence Reed, but avoid any plants that seed freely—notably Senecio tanghuticus, the coarser lythrums and Epilobium augustifolium, if their increase cannot be controlled. If these groups are disposed so that plenty of promenading space is around them and among them—many positions will suggest themselves for colonies or "sweeps" of erythroniums, the meadow fritillary in several colour forms, Smilacina racemosa, podophyllums, Irises verna, cristata and virginica, dodecatheons, gaultherias, pernettyas, and—greatest desiderata of all—cultivated forms of British ferns selected for their elegant leafage. These plants could literally lie at the feet of the taller shrubs and grasses, seeking and receiving shelter from them.

Connecting this zone of vegetation with aquatics proper are hosts of water-loving plants that delight to grow in rich soils, many with water laving their roots, others just beyond its reach. Culturally, it may be said of them, they will grow in any rich, moist soil, but many need wind shelter, and where groups of trees and shrubs can be arranged within a yard or two of the water's-edge, these damageable kinds could complete the grouping on the water's side and "face" across stream or lake. Such are the astilbes, an important group of plants for waterside, and doubly valuable when boldly massed with woodland as a background. Excellent plants for skirting a river are Spiræa venusta, a replica of our common spiræa in carmine-pink colouring; Spiræa palmata elegans, a plumy mass of pink. The double white Spiræa ulmaria, Gillenia trifoliata, and the cimicifugas. Formal grouping does not help these plants, they should be planted in loose order, the inflorescences are too elegant to crowd into meaningless heavy masses. Choose a rich site for a bold clump or group of Spiræa kamtschatica; this magnificent plant yields massive heads of creamy flowers, borne on stout stems two yards high, and is a model of luxuriant growth. Many of the great race of irises find their happiest home by waterside. I. Kæmpferi, planted 'twixt wind and water, and I. Delavayi, I. versicolor, I. fulva, I. sibirica, and its improved form Snow Queen, will last for years in a rich soil, and give a wonderful display of flowers throughout summer. Iris Kæmpferi should be grouped away from the others, the flowers are so magnificent that an environment of greenery is all they need in flowering time. Bamboos and willows provide for these an excellent setting.

Other irises admissible here, although common garden plants, are ochroleuca, aurea, and Monnieri, white, deep yellow, and pale yellow respectively. These species will grow in any garden soil of good tilth and are a greater gain to waterside planting when the banks are higher than is good for the Kæmpferi group. Low promontories afford picturesque sites for the display of Gunnera scabra and manicata, giving these plants unlimited room; in fact, isolate them if possible. Ofttimes it is really necessary to provide a similar place for drier sites projecting into the water, and for these Ferula gigantea, communis, and its form neapolitana, are excellent. The remarkably elegant leafage and inflorescences silhouetted against the sky give a grand picture, and noteworthy is that these plants are quite ornamental in early spring and summer when most waterside plants are "getting on."

THE SIBERIAN IRIS EFFECTIVELY USED ON MARGIN OF LAKE.

Lesser plants that could be grouped at the feet of taller plants at the water's edge are the double form of Cuckoo Pint (Cardamine pratense flore pleno), Primulas japonica, sikkimensis, involucrata, and rosea, Bog Pimpernel, and Myosotis palustris. Sites for these little plants are always findable, and it is noteworthy they will thrive better associated with sheltering plants than in the cultivated bog garden.

Many remarkable bits of waterside grouping present themselves in various parts of the country. In a Gloucestershire garden the Knap Hill Gavin thrusts its horizontal growths over the water's edge, and in the cavern thus formed colonies of Cyclamen coum and ibericum find a surprisingly realistic home. Here, on the banks of Cheddar Water giant plants of Fuchsia Riccartoni and globosa throw gnarled stems, in the form of arches, halfway across stream, and long pendant branches laden with blossom dip to the water's surface. In some of the rocky gorges through which the stream passes, the Wayfaring Tree hangs from the stone sides, and sprays over the water. Artists delight in this scene, and it is cited to show water gardening need not begin and end with subaquatics. Such plants do not appear incongruous because their habit is in good character, but of such trees as Taxodium distichum, so much recommended for waterside, there is but little that is favourable to note.

Ponds and Watercourses.

It is obviously difficult to artistically associate a small pond or narrow watercourse with breadth of landscape; and, although many attempt it, the result is a reflex upon the effort. Such water gardens should be self-contained, and well furnished with shelter belts of trees and shrubs, and their contents should be proportionately small habited. Instead of employing gunneras, ferulas, bocconias, hydrangeas, and giant grasses, I would here limit my choice to Polystichum angulare in its many diversified forms. Among these I would grow Liliums canadense, pardalinum, parvum and superbum; astilbes in one or two varieties, notably Snow Plume and the new pink Peach Blossom, or Queen Alexandra, and, of still bolder habit, rivularis major; a group or two of Iris Kæmpferi, Spiræas venusta and palmata, Spartina cynosurioides, Butomus umbellatus, the double caltha, and practically all the primulas noted already. These will form the principal groups of the small water garden, and all will delight to grow at the water's edge or a yard or two away from it, provided the soil is damp. Leave one or two broad interspaces in which the turf touches the water, and here dibble in the turf Bog Pimpernel, Iris cristata, erythroniums, Narcissus bulbocodium citrinus The Meadow Fritillary, Parnassia palustris where turf and water meet, and the pinguiculas. At the feet of the iris, astilbe, spiræa, and other taller plants, group the treasures of the small water garden—omecons, cypripediums, trilliums, Orchis foliosa, sanguinaria, epigæa, and gaultherias.

My teaching and practice has always been to make a few elegant plants, freely grouped, the dominant features of the small water garden, and around these or among these, wherever a corner exists or a frontage looks bare, there to plant "drifts" of lesser plants, literally as ground "furniture," it is really their home. The plan gives a better picture than is obtained by planting 200 kinds of plants on 200 square feet of soil, their presence there being (often necessarily) indicated by 200 labels. A group of iris or spiræa would provide at its margin a home for many little plants, such as sanguinaria and erythronium, and their early retirement is effectually concealed by the increasing luxuriance of the host clump. A word of warning and I have done. Do not be tempted to plant glyceria and phragmitis or the taller polygonums in the small garden; and watch carefully, lest their increase be overwhelming, such aggressives as mimulus, epilobiums and lythrums. Select sheltered and shady sites for osmundas and onocleas among ferns, and give to all iris clumps the fullest sunshine possible.

G. B. Mallett.

Cheddar.

A TASTEFULLY PLANTED STREAM IN AN IRISH GARDEN.

WALLFLOWERS FOR NORTH BORDERS.

It is very often a difficult matter to make a border with a north aspect gay with flowers in the spring at a very small cost. Quite recently I inspected a splendid lot of wallflower plants growing on a north border, one which was being continually swept by a cold wind. The plants were sturdy, with rich dark green leaves, and giving promise of an abundant flower display. One of the principal causes of the success of these plants was the early raising of the seedlings.

If the seeds of wallflowers were sown earlier than is usually the case by inexperienced cultivators, and the resultant seedlings grown in a firm nursery bed before being transplanted to their flowering quarters, we should see more strong specimens in spring than we do; plants fit to grow in any part of the garden. The seeds should be sown in the open border in May.

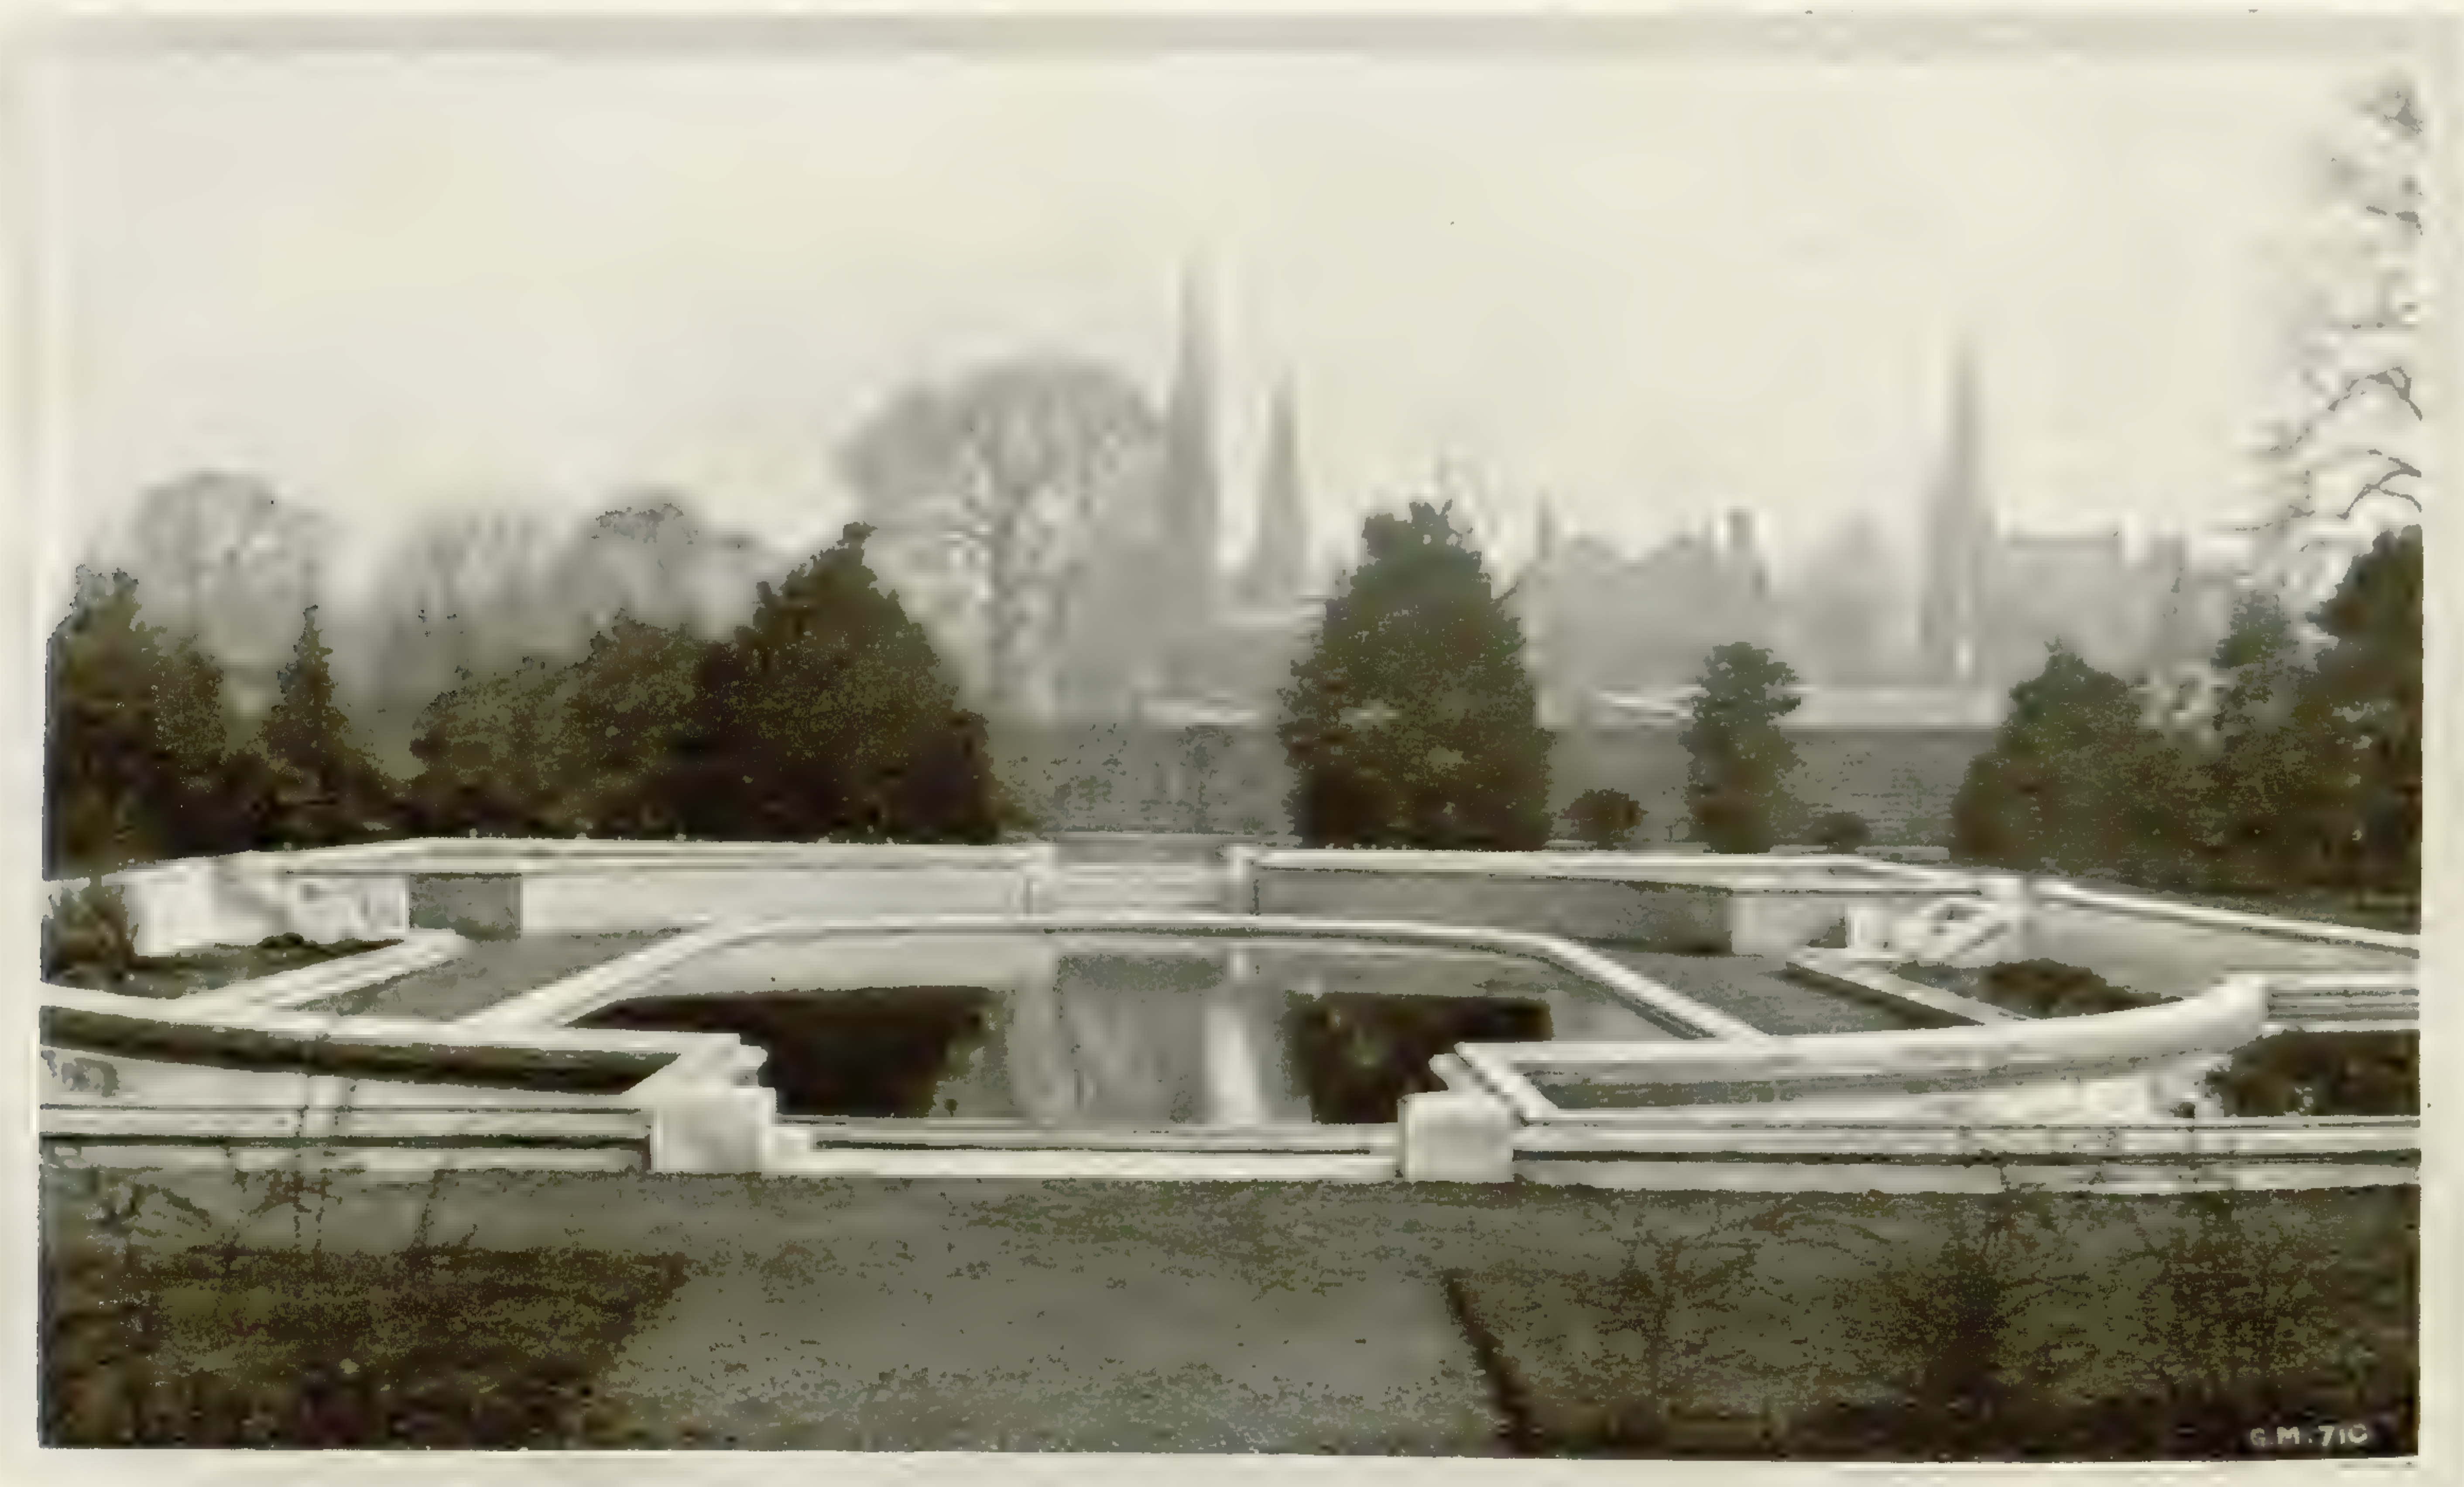
Geo. Garner.

Pansies in Sandy Soil.—Sandy soil is like a sieve, it lets the water go through it freely; it is not a rich medium, and certainly not the kind that would be selected for growing pansies in. But I have grown very fine plants in a sandy soil, and seen others growing in almost pure sand—very satisfactorily, too. In certain circumstances pansies must be grown in such soil as is described above, and the cultivator must overcome all obstacles. My system is to dig in a liberal quantity of well-rotted manure four inches below the surface, then plant early in the season, and put on a mulch. The plants are established before the hot weather comes, and if water be given when required, and faded flowers are regularly removed, a rich harvest of blossom will result.—G.

LAWNS.—Those who desire to make a new lawn or bowling green, or to renovate and maintain existing ones in good condition, can have no better guide than "LAWNS AND GREENS," by T. W. Sanders, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post 1s. 9d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

FORMAL WATER GARDENS.

In the planning and the planting of water gardens, those who would achieve a full measure of success must give careful consideration to the all-important question of appropriateness. There should be complete agreement between the water garden and its surroundings; and, speaking in a general way, this can be more readily obtained by adapting the design to the site selected than by preparing the plan, as is sometimes done, and then making such alterations in the site as may be necessary to ensure it forming a suitable setting to the garden. Appropriateness should obtain special prominence when the question whether the garden shall be formal or informal is being determined. The two styles are not equally adapted to all positions that may be available, as so well known to many of my readers. It should be hardly necessary to state this fact, but experience has taught the writer the necessity in dealing with a matter of this kind, of avoiding ambiguity. Moreover, it is clear from observations made in various parts of the country that it is as easy to make mistakes in the cultivation of hardy aquatics as in other phases of the cultural art.



NEW FORMAL WATER GARDEN, ROYAL GARDENS, KEW.

The question whether the water garden shall be formal or informal should not be determined by the preference of the owner or the special fitness of either form for the requirements of any particular class of plants, but by suitability for the position selected. Each form has its advantages and disadvantages from the cultural standpoint, but the informal garden is the best adapted to the cultivation of a representative collection, and also for the display of the distinctive charms of the several kinds. Upon this point there cannot well be any difference of opinion, and where several sites are available, and it is not desired to have the hardy aquatics near the house, one should be selected where a natural style of arrangement can be adopted. Because of its superiority it must not be assumed that the informal water garden is the only one from which really satisfactory results can be obtained. So far from this being the case, there are many gardens in which it is more or less unsuitable, and in not a few gardens the formal water garden would be the best for the site which it is desired to devote to aquatics. For instance, when it is desired to grow nymphæas and their allies within a short distance of the residence, or on a terrace where straight lines prevail, the informal water garden is quite out of place. If the dwelling-house and terrace occupy the higher part of the grounds, we are reminded, as we admire the occupants of the water area, that Nature marks out the courses for brooks and other streams along the lower ground, and that, as a rule, pools and lakes have a place in the valley. This incongruity, therefore, materially detracts from the pleasure well-grown hardy aquatics are so well able to afford.

For the positions mentioned in the preceding paragraph formal gardens are preferable, or to state the case more strongly, are alone suitable. When a formal lily pool, such as that at Downside, Leatherhead, the residence of A. Tate, Esq., occupies a position on the grassy slopes in the higher part of the grounds or on a high terrace, one is not troubled about the law of gravitation in relation to water. It is at once recognised that the pool is the creation of art, and one is able to admire the ornate or plain masonry, as the case may be, and to enjoy the beauty of the water lilies that float on the surface. Formal water gardens have their value, and may be made to contribute liberally to the attractions of the pleasure grounds when given sites in which they will be in harmony with their surroundings, and furnished with plants best adapted for cultivation in them.

The beautiful formal water gardens which contribute so liberally to the many attractions of Downside is one of the best of the types in which the architectural features are somewhat ornate. Here the ornamentation is by no means excessive, and, as so clearly shown in the illustration, is chiefly confined to the handsome vases; and the effect produced by the expanse of lilies is particularly good from the higher ground. The nymphæas that have found so excellent a home at Downside include the finest of the many handsome forms now in cultivation, and enjoying to the full the bright sunlight and pure air characteristic of this favoured spot, they bloom in profusion, and produce flowers that are quite exceptional in their development. Highly ornate also is the formal water garden at Easton Lodge, near Dunmow, the Essex seat of the Earl and Countess of Warwick. This garden has a comparatively large area, and is sunk several feet below the general level. The pool has a broad walk round it, and the wall by which the area is enclosed is surmounted by a handsome balustrade. Water gardening obtains special attention at Buckhurst, near Groombridge, for both Mr. and Mrs. Benson are very partial to water-loving plants. A considerable area of the magnificent lake has been converted into an informal water garden, and on the terrace on which the mansion stands there is a water garden of a formal character. Ornate stonework would have been out of keeping with the surroundings, and instead of the coping of the enclosing wall being raised above the surface, the wall terminates about twelve inches below the general level, and forms, as it were, a step down to the water. Level with the upper edge of the wall a stone platform is formed at either end. The pool is between twenty and thirty feet in length, and of a proportionate width, and the nymphæas are limited to the very best of the varieties of medium growth.

The new formal water garden in the Royal Gardens, Kew, is quite distinct in design from those already having a place in British gardens, and no doubt need be felt as to it proving a feature at once interesting and attractive when the plants have become established. With the aid of the accompanying illustration, the reader will have no difficulty in obtaining a clear idea of the general arrangements. The garden is 104ft. long by 62ft. wide, and is on two levels. The four corner tanks are eighteen inches or so above the general level, while the central tank is 2ft. or so below, and is approached by six flights of steps. The central tank is 71ft. long by 28ft. wide, and is provided with hot-water pipes for warming the water therein, and thus permit of the successful cultivation of certain of the plants that require water of a higher degree of temperature than that to which water attains in the open under ordinary conditions. The corner tanks are 24ft. by 24ft. and the two borders which flank the central basin, and will be devoted to bog plants, are 36ft. long by 7ft. wide. This garden has been formed on the ground that has been devoted to hardy medicinal plants on the north side of No. 2 Museum.

It will, of course, be fully understood that provisions must be made for effecting such change in the water as will prevent it becoming stagnant, and as this will consist simply of an inflow pipe one side and an outlet on the other, detailed description is unnecessary. A layer of soil about 18in. in thickness should be provided as a rooting medium for the occupants, but no manurial matter should be used. If the garden or pool is of comparatively large size, a few plants, other than nymphæas, that grow naturally in the water may be sparingly used; but where of moderate or small dimensions water lilies alone should be planted.

G.

Trifolium pannonicum. — Not many of the species of trifolium are valuable border plants, but the subject of this note is an exception, being specially showy during a good part of the summer. It is a strong-growing species, measuring eighteen inches in height, bearing large oval heads of flowers of a sulphur-yellow colour. Grown in a rather dry, starved position, it presents a wild and striking appearance, but under the more liberal treatment of the herbaceous border it is still better, and forms a fitting companion to the handsome T. rubens.—E. J. Allard.

LOBELIA TUPA.

Distinct in its appearance, and a striking plant in every way, is the lobelia known as Lobelia Tupa, or Tupa Feuillei. Although in cultivation for a considerable time, its doubtful hardiness has militated greatly against its general introduction into gardens, and it is thus not commonly met with by visitors to these. So many have tried it, and have failed to make it a permanent occupant of their gardens, that it has acquired a bad reputation, and has been kept at arm's length by many whose pleasaunces would be all the better of this striking flower. Varying in height from three to five feet, with its rather lance-shaped, narrowish leaves covered with whitish down, and its spikes of reddish flowers, it looks well indeed among other flowers or grouped boldly by itself.

The difficulty of cultivating it seems to be that it likes a rich, but light soil, which is not too wet in winter, and I have been surprised to meet with it so far north as it has come under my observation. On inquiry, however, I found that the plants had, from first planting, been protected by ashes or litter in winter; in some cases, indeed, a frame was also put over them at that season, especially during the first few winters after they were planted; this gave them a chance of becoming established. In some gardens it was thus put in a position to survive ordinary winters, but an unusually severe one proved fatal.

There is no reason, however, why Lobelia Tupa should not be more cultivated in the south, and it is recommended to readers well south of the Humber, who can give it a dry soil, a sunny position, and some slight covering during the winter months.

It is one of the Chilian and Peruvian plants which ought to be easily accommodated in our climate in average seasons, but which baffle us at times despite the utmost care.

S. Arnott.

MARECHAL NIEL ROSE ON OUTSIDE WALLS.

About ten years ago I saw one of the healthiest plants of this variety that I can remember having noticed, growing on a cottager's house wall in Cheshire. The tree was a young one, and had borne some magnificent blossoms. I was not able to find out how the tree behaved in after years, but I was very much interested at the time.

In Hampshire I have flowered Maréchal Niel rose on outside walls very successfully some seasons and entirely failed with it in others—failed to get the flowers to develop freely and of good colour. The failures occurred when cold winds were very prevalent during the early weeks of the summer. Where the branches can be trained under the glass copings of walls wonderfully fine blooms of this king of yellow roses can be grown. Both the leaves and the flowers require some protection from frosts and cold winds. The bare stems below the glass coping should be protected with mats in winter time during severe frosts only.

The present is a good time for planting out strong specimens from pots.

A FORMAL WATER GARDEN IN THE ITALIAN STYLE,
At Downside, Leatherhead, the residence of A. Tate, Esq.

WATER LILIES.

The exquisite charm of waterside scenery, the beautiful effects of flower-strewn margins and lily-clad lakes, and the pleasing results attained by joining hands with Nature in garden design and adornment, is making the water-garden an item of first-class importance in the "garden beautiful."

And it is in following up this subject of water-gardening that the real value of water lilies and similar subjects has been brought home fully to the garden lover, until at the present time the English garden cannot be considered complete unless it has its delightful setting of lily pools and flower-clad watersides. It matters but little whether the garden is of limited extent, or whether it is of great dimensions, the fact remains that amid the great range of nymphæas there are those suitable for all phases of water-gardening.

[Photo: Miss K. Dendy Sadler.

"WATER LILIES."

The lake of considerable acreage, the rockery ponds, the pools in the wild garden, and even the modest sunken lawn tubs, or ornamental basins, can all be rendered exceedingly beautiful by the wise grouping of suitable species and varieties.

The newer hybrid forms give a range of the most exquisite colourings, beautiful forms and gloriously luxuriant foliage of diverse hues, and the thanks of the flower-loving community are due to M. Latour-Marliac, and other raisers for the magnificent hybrids they have raised.

The Marliac varieties are superb for medium and large-sized pools and ponds, where ample allowance can be made for their free growth. With plenty of room for expansion, and the margins effectively clad with selections from the more notable waterside plants, a series of well-arranged pools, overspread with the handsome foliage and the exquisite blossoms of this group, gives a pleasing touch of beauty, which softens and exquisitely tones the whole garden scene.

A few remarks upon the notable forms existent among the stronger growing water lilies may, perhaps, be of service. Of M. Marliac's novelties one notes the lovely white N. Marliacea albida, an exquisite white with a central mass of golden anthers; N. M. carnea, a dainty golden anthered pink variety, which shades to white at the petal's edge; N. M. chromatella, a soft hued yellow, whose beauty is heightened by its central crown of gold and its dark lustrous leafage; N. M. flammea, a lovely carmine gem, softening to pale rose at the petal tips; and N. M. ignea, a bright fire-lit carmine-red with orange-red anthers. In N. M. rosea we have a handsome, pleasing rose-coloured form, which is wonderfully floriferous, while N. M. rubra punctata, with its rosy purple blossoms profusely dotted with carmine, concludes a group of good and tried varieties from the French raiser. The whole group is noteworthy for its robust, highly ornamental foliage.

In addition to the foregoing I would note a few of the best of the other principal forms. Among these are the handsome N. Aurora, with its adornment of bronzy yellow, shading to orange-red as the blossoms age. N. colossea is grand, a soft rich pink of immense proportions, robust growth, and unsurpassed freedom. N. gloriosa is a beautiful rosy pink suffused with carmine. N. Frœbelli, a rich vinous crimson of good size and exquisite formation, and N. fulva, an orange-yellow deepening in hue towards red.

A few others of much merit are N. lucida, a glowing pink deepening to red, with beautiful stellate blossoms; N. Gladstoniana, the giant, and beautiful white variety of our own native N. alba; N. atropurpurea, a superb form, the flowers large, deep ruby-red, with golden stamens; N. William Doogue, a soft pink of great size and beauty; N. James Brydon, a sterling globular hybrid, with rosy crimson colouring; N. sanguinea, a rich and dainty ruby-carmine; N. Seignouretti, an easy growing, delightful gem, with soft yellow blossoms suffused with pink; and the beautiful N. tuberosa, with its fine varieties, Richardsoni, rosea, and rubra, a group of glorious giants in pure white, shell-pink, and carmine-red respectively.

The range of the lesser nymphæas especially suitable for small pools and tub-culture is considerable, and one has only to mention the N. odorata, N. Laydekeri, and N. tetragona groups in order to show that plenty of material for this phase of water gardening is already existent. The American N. odorata group is especially rich in fine varieties, and the whole set is effective in appearance, with ornamental leafage and dainty blossoms lifted well above the water's surface. The type is a well-known white, sweetly fragrant, a characteristic which the whole of its varieties share. N. caroliniana is an exquisite rosy pink, of free growth; N. exquisita is a sterling rosy carmine, with grand blossoms; N. gigantea, a notable white of fine appearance; N. minor is a miniature white; N. rubra is a deep rosy red of good size; N. luciana is a small replica of N. caroliniana, while the two sulphur-yellow forms, N. sulphurea and N. sulphurea grandiflora are daintily pretty and well worthy of acquisition. Of the Laydekeri group, N. fulgens, a rich glowing red with crimson anthers; N. lilacea, a favourite rosy lilac variety; N. rosea, a wonderfully floriferous rosy pink, and N. purpurata, a deep-rich purplish crimson, are perhaps the most notable and pleasing.

N. tetragona (or N. pygmæa), the smallest of water lilies, is very serviceable for the smallest of tubs or pools. The blossoms are pure white, with a mass of golden anthers, while in the variety N. helvola one has the same miniature form in a pale yellow colouring. N. Ellisiana furnishes a delightful bit of colour, with its dainty formation and its rosy carmine blossoms, and can be utilised in the lawn pools with exquisite effect. The planting of water lilies should be proceeded with at once, and completed without unnecessary loss of time. It is a very good practice to put each plant in a small flat basket, filled with turfy loam, on the surface of which a few stones have been laid, and lower the basket in the position which the plant is to occupy. When the plants have become established they should not be allowed to become overcrowded.

Though the nymphæas form but one group of many which can be associated with the water garden, yet they will always occupy the highest place among the true aquatics, forming as they do the central feature of the water-garden proper. It is well that one can associate with them such a host of delightful subjects for margining the watersides. There is wealth unlimited, and the whole question of making the water-garden picture a blending of perfect formation and beauty, lies with the garden maker alone. His subjects are perfect, of varying contour and diverse in colourings, he has no lack of material for all phases, and given the touch of the artist, the eye for exquisite arrangement, and a hand unfettered in utilising the subjects chosen, the picture evolved should be one of exquisite grace and perpetual interest.

P. S. Hayward.

THE SPIRÆA FAMILY IN THE BOG GARDEN.

Botanists rigidly discriminate between astilbe and spiræa, placing the former under the natural order of Saxifragaceæ, while the spiræas are included in the same stately order as the rose, namely Rosaceæ. That there are technical points to support this distinction can readily be ascertained upon close examination, yet the general character and habit of both genera are practically identical, at least in so far as the herbaceous species are concerned, so that for garden purposes we may disregard this classification and treat them upon grounds common to both.

SPIRÆAS AND ASTILBES IN THE BOG GARDEN AT WALMSGATE, LOUTH.

They constitute a race of stately, noble perennials of undoubted hardihood, as conspicuous by reason of their elegant compound foliage, as they are justly admired for the grace and beauty of the flowers, which are produced upon the upper portion of the slender stems, at times in the form of a flattish head, but in the majority of instances in branching terminal spikes. So freely are these wand-like stems produced upon established clumps, which embrace colours most appropriate for massing, that their effect in garden decoration is not readily overestimated, combining features distinctly novel and striking. The foliage in nearly every instance is of similar character, but two types of inflorescence are present, namely, that in which the panicle is compound and axillary, forming a more or less flattish head, as in Spiræa kamtschatica, and in the other and most frequent type we have terminal branching heads, forming pyramidal spikes of great elegance, of which Astilbe chinensis and Spiræa aruncus are good examples.

The cultivation of astilbes and spiræas present no great difficulty provided we recognise their partiality for water, for though chiefly exotics, they are quite as hardy as any indigenous plant, as I have grown them in saturated bog-beds year in and year out, and find each floral harvest equal to, if not surpassing, that which went before. Rich soil and abundant supplies of manure will meet the requirements of both genera, but I hold that their great decorative value can best be appreciated, as their beauty is developed in greatest luxuriance, when grown in wet ground, and in close proximity to water. As moisture-loving plants, their home is essentially beside water, and wherever this feature is introduced in an informal manner in garden or pleasure ground, there endless opportunity will occur wherein these genera can be employed to the very best purpose. A strong point in their favour is their suitability for gardens of any extent, for they never run riot among choicer and daintier subjects, and in small gardens we can always restrain the most vigorous by employing them as specimens, giving precedence to the dwarf species and their varieties when planting in groups; conversely, a striking effect would result, where opportunity offered, to plant a score or more of Spiræa aruncus beside some extensive lake or upon the moist banks of a sluggish stream.

Given the conditions above indicated, both genera may be planted at any season, summer excepted; April and May are most suitable, as at this season wet-ground plants soon overcome any ill-effect consequent on disturbance, breaking into activity almost at once.

To spiræa belongs the distinction of containing the tallest species, namely S. kamtschatica (gigantea of gardens). It is a plant of great merit for the wild garden, frequently reaching a height of 10ft., the type has white flowers, and the variety Elegans produces flowers of a soft rose colour; the latter is scarcely so vigorous in growth as the type. Spiræa aruncus is a plant of lesser stature, forming shapely, rounded bushes when established, each stem terminates in a creamy white panicle of blossom, slightly pendulous in habit, a splendid subject for bold planting. Spiræa palmata has very rich crimson flowers, deepest when grown in half shade, and reaching 4ft. in height; Alba is a white form, and Elegans pink; both are more vigorous than the type. Spiræa lobata (venusta of gardens) is old, yet one of the best, and the pink flowers are borne upon 4ft. stems; like palmata, the colour is best in shade. A cross effected between S. lobata and S. kamtschatica has every promise of developing seedlings of more than average merit, intermediate between the parents, with deep cut foliage and flattish flower-heads of soft pink and white. I have had my attention drawn to the fact that Mr. Perry, of Enfield, is distributing the first set of these hybrids this spring.

Spiræa filipendula is a native plant, surpassed for garden purposes by its double form, which has white buttonlike flowers, perfectly double; the foliage of this plant is extremely beautiful. S. astilboides is a well-known plant, producing slender stems with white flowers; the average height is 2ft. S. floribunda is a dwarfer variety with feathery white plumes, about 21in. in height; and S. longifolia has arching stems some 30in. high.

Treating the allied genera in the same order, we have in Astilbe Davidii a hardy perennial worthy in every respect to the claim which the introducers (Messrs. James Veitch and Sons) make on its behalf, "the best of its class; the elegant leafage more or less that of A. japonica on a large scale, flower stems six or more feet in height, the upper portion, 2ft., densely covered with deep rosy-violet, or mauve-coloured flowers." Both in the colour of the flowers and in the fastigiate habit of the flower spike is this plant distinct from all others, and a unique addition to the herbaceous section of moisture-loving plants.

A. grandis, like the preceding, was introduced from China by the same firm, and in this the flower stem forms a sparsely-branched, narrow pyramid, covered with creamy white flowers; it may be described as a 6ft. form of A. chinensis, though the flowers are not so pretty as in this species, nor do they remain effective for very long. A. rivularis resembles in a general way the better-known Spiræa aruncus; the heavy panicles are cream-coloured.

Astilbe chinensis is a plant of marvellous beauty, the flowers are a soft rich shade of pink, borne profusely on slender, arching stems that spring in enormous quantities from the crowns. It is an old plant, which yet maintains its position in spite of the many fine additions made recently to this group. A. japonica is a well-known species, extensively grown for pot work and forced in spring under glass. It is largely superseded both for indoors and open-air use by a set of hybrids obtained by crossing this species and A. chinensis and Spiræa astilboides. In every instance these hybrids are highly floriferous, and they may be grouped under two sections, namely, those with slender, arching spikes, like A. chinensis, and those dwarfer, like A. japonica. To the former belong W. E. Gladstone, the best white; Queen Wilhelmina, creamy-white; Neiée Rose, very pale pink; Avalanche, pure white; and Snow Plume, snow white. Those of a more compact habit include Compacta multiflora, a variety with very dense, creamy spikes; Blondin, a lovely white; Delicata, very pale flesh, only 18in. high; Silver Sheaf, a magnificent plant for small gardens, closely resembling Snow Plume, but in this instance a silvery white; Peach Blossom, clear blush pink; and Queen Alexandra, deeper pink.

The flowering season covered by these forms extends from the last week in June until the end of August, the foliage in every instance remains effective until destroyed by autumn frosts.

Thomas Smith.

Walmsgate Gardens.

HARDY AQUATIC PLANTS.

Gardens which possess a picturesque stream or lake have an advantage over those which do not include such assets, for, in addition to the water being of much assistance to the general landscape effect, a great many beautiful plants can be grown which are never met with in those gardens where a sheet or sheets of water do not exist.

Unfortunately, the owner of a garden only too frequently thinks that a lake, pond, or tank must be introduced, or the garden is not complete, and such introductions very often spoil what would otherwise be a charming garden. It is quite probable that, if a landscape gardener were asked, "which feature more than another in the laying out of a garden which was to include a lake would give him the most trouble?" his answer would be "the lake," that is, providing no natural lake, stream, or spring existed. It is extremely difficult to so arrange a lake that the surroundings shall look natural, and that a constant supply of fresh water is assured, for it must be borne in mind that the water supply must be adequate for the driest periods, else, if a dry time occurs, the water level may sink considerably, doing serious injury to plants, and forming an eyesore in the garden. Water that is likely to become stagnant, too, causes much trouble, for, in addition to the smell which is given off, rank weeds multiply exceedingly and make a considerable amount of work.

Should a natural sheet of water exist, however, or the provisions be ample for the formation of a lake, it will be found to be a charming feature both on account of the variation it makes from the surroundings, and from the number of interesting and beautiful plants that may be grown.

The introduction of plants into a lake needs careful consideration; those of very vigorous growth should be planted sparingly, for, if they once get the upper hand, it is most difficult to eradicate them, whilst all plants should be so placed that they may be easily seen from the bank, and that they do not encroach on the best reaches of water. If a beautiful lake exists in a garden, then let the water be seen, and make the most of it; carefully plant the margins so that every few yards a fresh view is opened up, but let it be a view with water in it, not a dense mass of floating vegetation. Ample space for aquatics may usually be found about the margins or in miniature bays, but the main part of the lake should be kept open. Even in the case of ponds formed specially for aquatic plants, a better effect is always made if the plants are so placed that good spaces of open water can be seen between each two.

When selecting plants for the water proper, as apart from those which grow about the banks, half in and half out, we naturally turn, in the first place, to the various nymphæas, and the majority of them are, indeed, delightful subjects; the flowers, red, yellow, or white, floating on the water with their setting of large green leaves, looking the personification of grace. There are, however, other things which are decidedly worthy, and it is to these that special attention is directed in this article.

One of the first plants to attract attention is the yellow water-lily (Nuphar luteum). This is a common British plant, which is found in many parts of the country. It is recognised by its thick, fleshy, creeping stems, which grow in the mud at various depths, from 6in. to 3ft. or so below the surface of the water, its large, rounded leaves, with two deep lobes at the base, and globular golden flowers, which are borne from the end of May to September. It can be readily established, and is a strong grower. In some parts of the country, the common name of Brandy-bottle is given to it.

A delightful little plant, with leaves closely resembling those of a small nymphæa, although the two genera are in no ways related, is Limnanthemum peltatum; sometimes called Villarsia nymphæoides. It has a creeping rootstock, which grows in the mud, whilst the annual stems float on the water. The leaves are small and dainty, whilst the flowers, which are an inch or so across, with fringed, golden petals, are borne slightly above the water. When in full blossom it is one of the most beautiful plants imaginable; it has, however, one defect, and that is its rapid growth. Care must be taken to restrict it or it will soon outgrow its space. The common name of Fringed Buck Bean is applied to it. Other species are known, two of which are Humboldtianum and lacunosum.

The Buck-bean or Bog-bean (Menyanthes trifoliata) is common in ponds and lakes in many parts of the country, and, although it is usually found where the water is shallow or in marshy ground, it will grow where the water is from 1 to 2ft. deep. The flowers are borne in racemes, are white or pinkish in colour, and fragrant. A colony is well worth introducing.

Aponogeton distachyum is a South African plant, known under the name of Cape Pond-flower. It is hardy in many parts of the country, and is one of the daintiest hardy exotic aquatics we possess. It thrives in water from 1ft. to 3ft. or more in depth, and under favourable conditions forms a large mass. The leaves are long and narrow, and float on the water. The flowers, which are borne slightly above the water, are white and fragrant, the scent being very similar to that of hawthorn. It is inadvisable to plant it in water in very exposed positions in the north, where severe frost is experienced.

The Frog-bit (Hydrocharis Morsus-ranæ) is a dainty little plant, with small rounded or kidney-shaped leaves and white flowers. It thrives best in shallow water overlaying rich mud. Another pretty native plant is the Water Violet (Hottonia palustris). It likes rich soil, and is found in water varying from a few inches to a foot or more in depth, while it is occasionally met with in marshy ground, where the water barely covers the leaves. The leaves are deeply lobed, and form a rosette on the water, while the flower-stalks rise to a height of 1 to 2ft., and bear lilac flowers with yellow eyes, in whorls at intervals. Several ranunculuses, such as R. marinus and R. heterophyllus, grow in water, their leaves and branches almost all submerged, and their flowers borne above water. They should be introduced with great care as they quickly outgrow allowable space.

Eichornea azurea, the Water Hyacinth, is a pretty water plant from Brazil. It thrives out-of-doors in the milder parts of the country during summer, and has been known to live through mild winters. It may be planted in a few inches of water, where it will rapidly increase into a fine patch. The leaves have wide blades, 5 to 7in. across, with swollen petioles. The flowers are mauve coloured, with a bright yellow blotch in each, and are borne in upright racemes.

The common Arrow-Leaf (Sagittaria sagittifolia) is a well-known British water plant, but for cultivation, the double-flowered form of the North American S. variabilis is preferable; it grows 2 to 3ft. high, and flowers well. In the milder parts of the country Richardia africana thrives and forms a picturesque object. At Trelissick, near Falmouth, it has become naturalised, and forms handsome foliage, while in their season many hundreds of pretty white spathes are open at once. Popularly known under the names of arum lily and calla, this plant must not be confused with the true calla, Bog Arum, or Marsh Calla (Calla palustris). This latter is a low-growing plant, which forms long creeping stems that grow out from the sides of a pond well into the water. The inflorescences are white and rather small, but the plant is worthy of cultivation.

The Flowering Rush (Butomus umbellatus) is a tall growing aquatic, with curiously angled leaves, and good sized heads of reddish flowers. It may be planted in about 6in. of water. The Water-Soldier (Stratiotes aloides) is a curious plant, more beautiful on account of its long, narrow, serrated leaves, which rise from the bottom of the pond, than for its tiny white flowers, which appear during summer. Utricularia vulgaris, the Greater Bladder-wort, is a curious plant with floating branches, and small leaves on which are air bladders, and yellowish flowers. It thrives in both shallow and moderately deep water.

The Indian Rice (Zizania aquatica) should be planted in rich soil in 9in. or a foot of water, and under these conditions it forms a handsome specimen 8 to 10ft. high, with large leaves and inflorescences. As it is an annual, seeds must be saved each year, and these require to be kept in a vessel of water through the winter. The seeds should be sown indoors, in water, in an intermediate or cool house in March, and the young plants placed out in May.

Although there are many other plants which will grow in water, the above are the most showy, and would form an interesting collection. To introduce them successfully they should be planted in baskets of soil and sunk to the bottom of the water.

Kew. W. Dallimore.

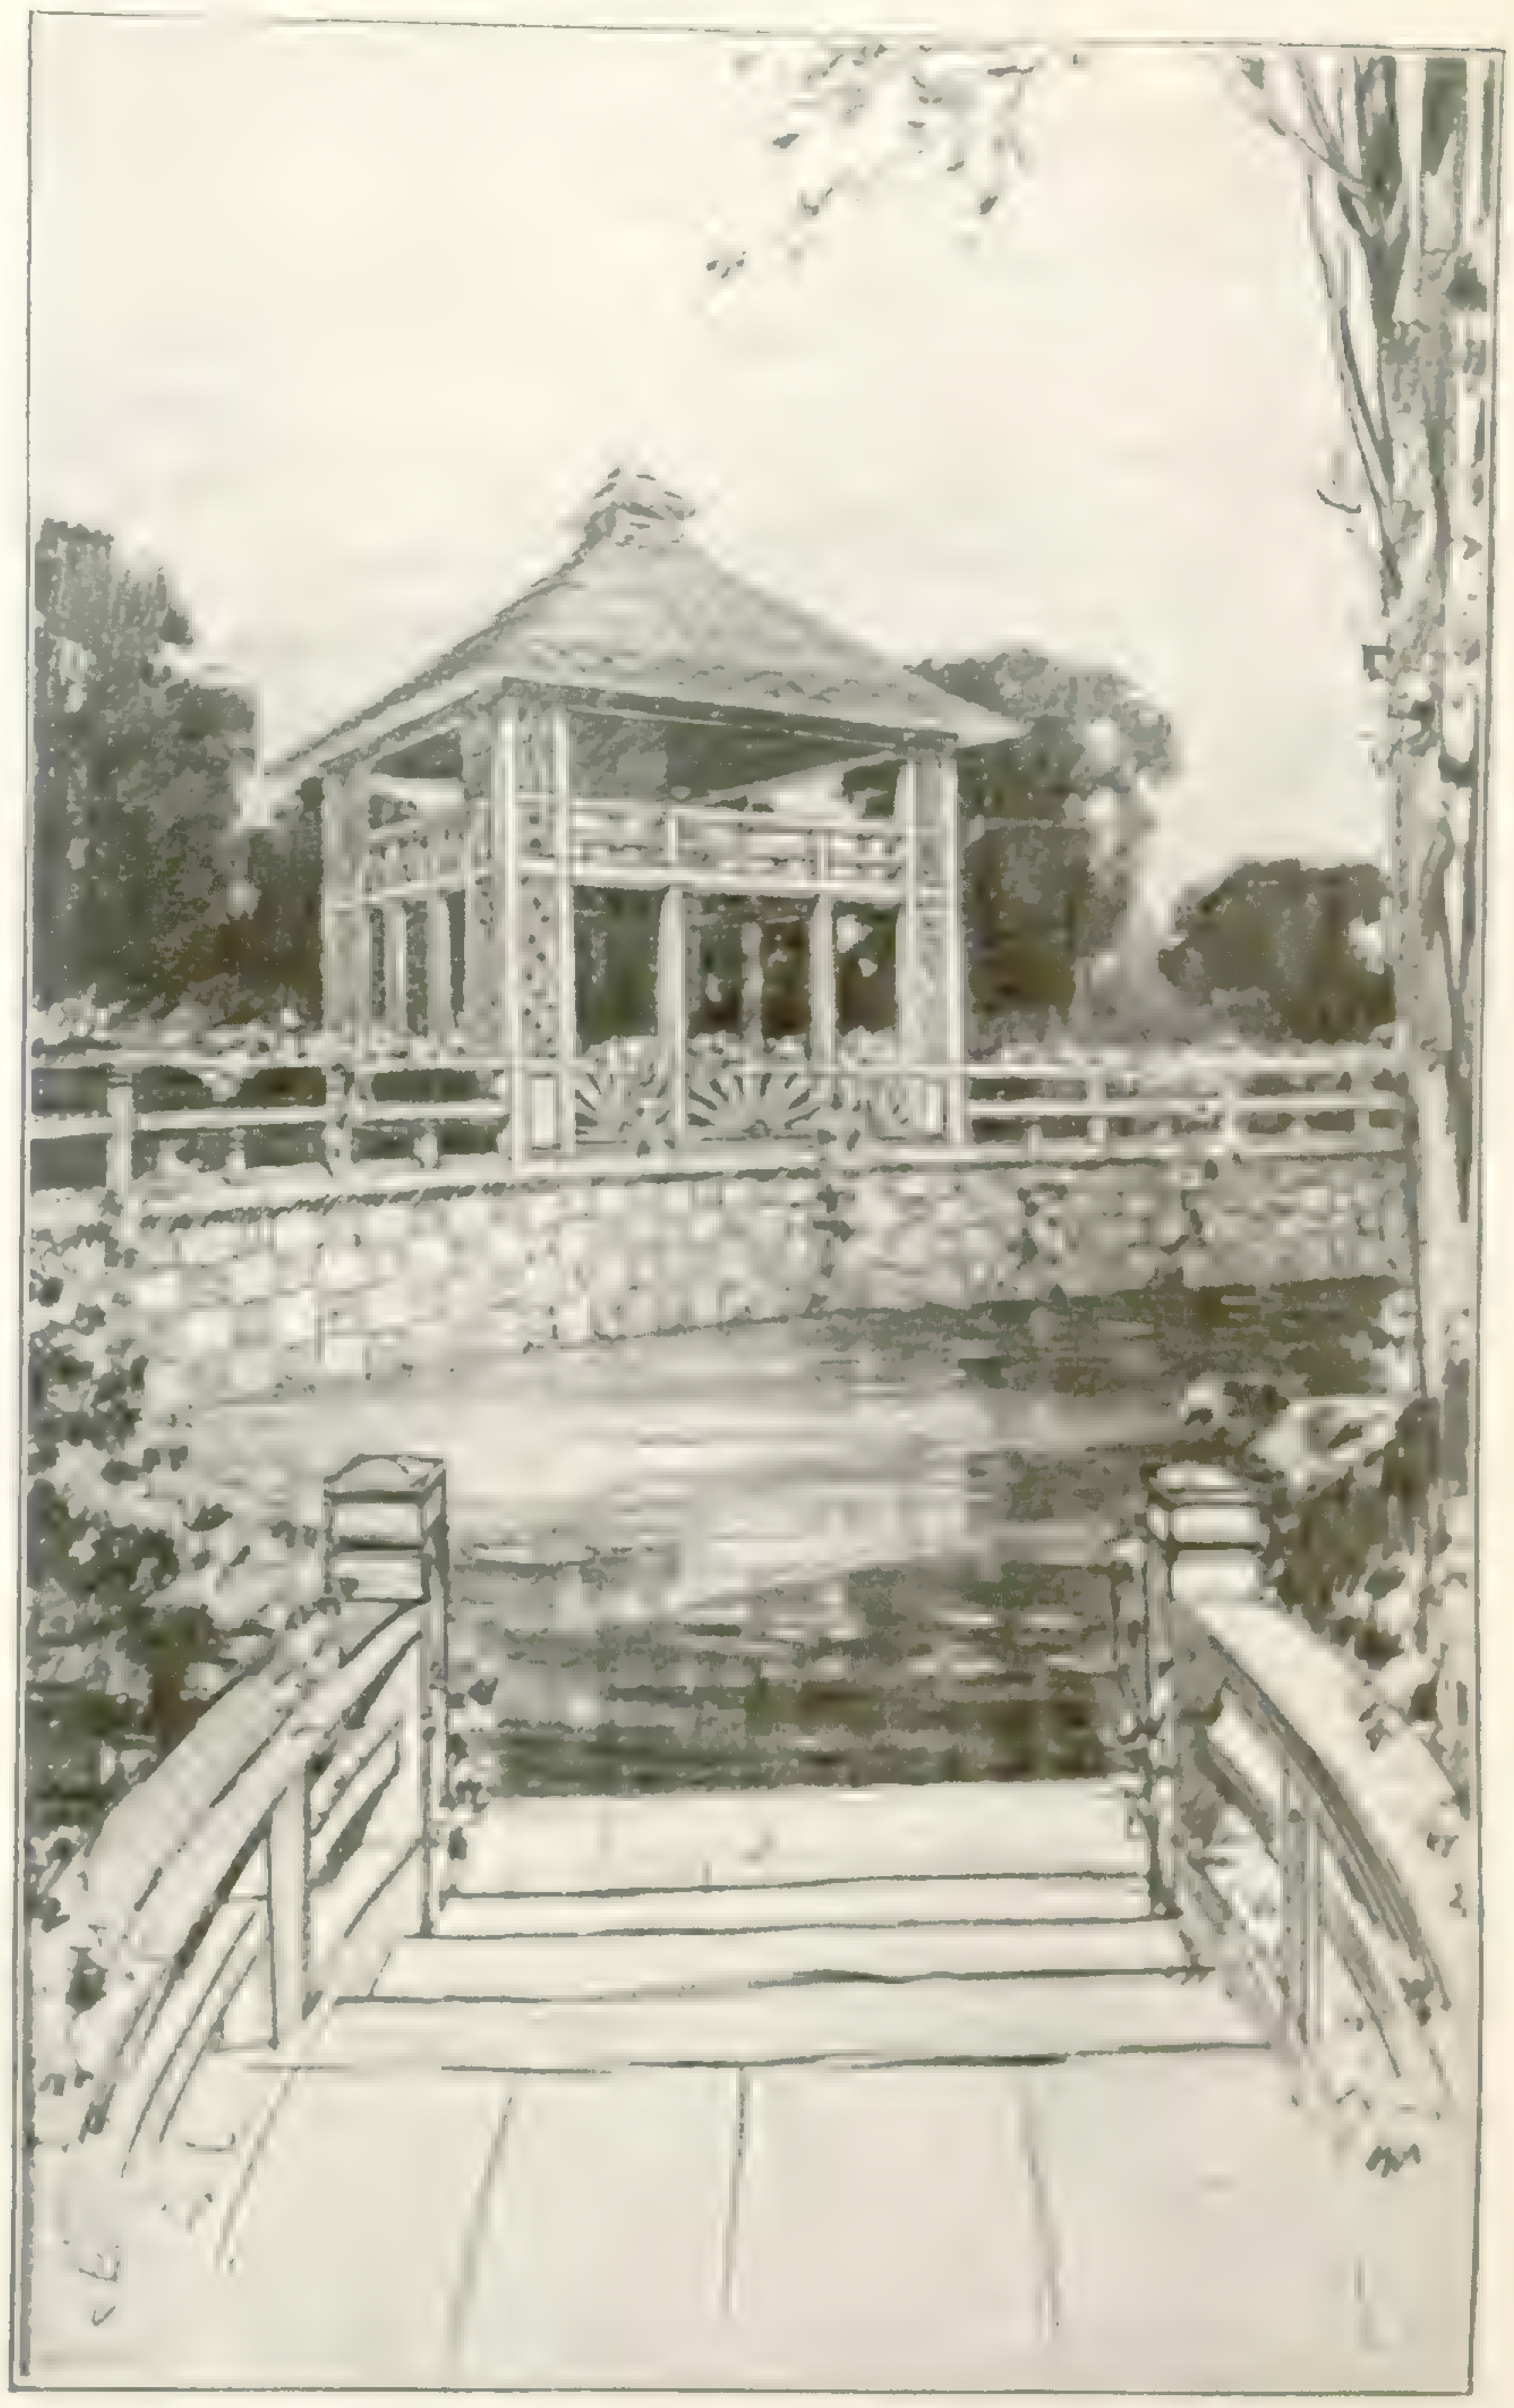
GARDEN DESIGN.

Under the comprehensive title of "Garden Design," we have received a charming folio work of only some two dozen pages from Mr. J. P. White, of the Pyghtle Works, Bedford. It is beautifully printed and illustrated, but its great value lies in the suggestiveness of the illustrations for designs in garden construction. Garden houses (we must give up calling these structures "summer houses, now), and bridges in connection with water gardening are the chief features dealt with in this booklet, and some of the pictures represent Japanese houses—bridges and gardens, while others represent greenhouses and bridges erected in this country and adapted in their design from Japanese models.

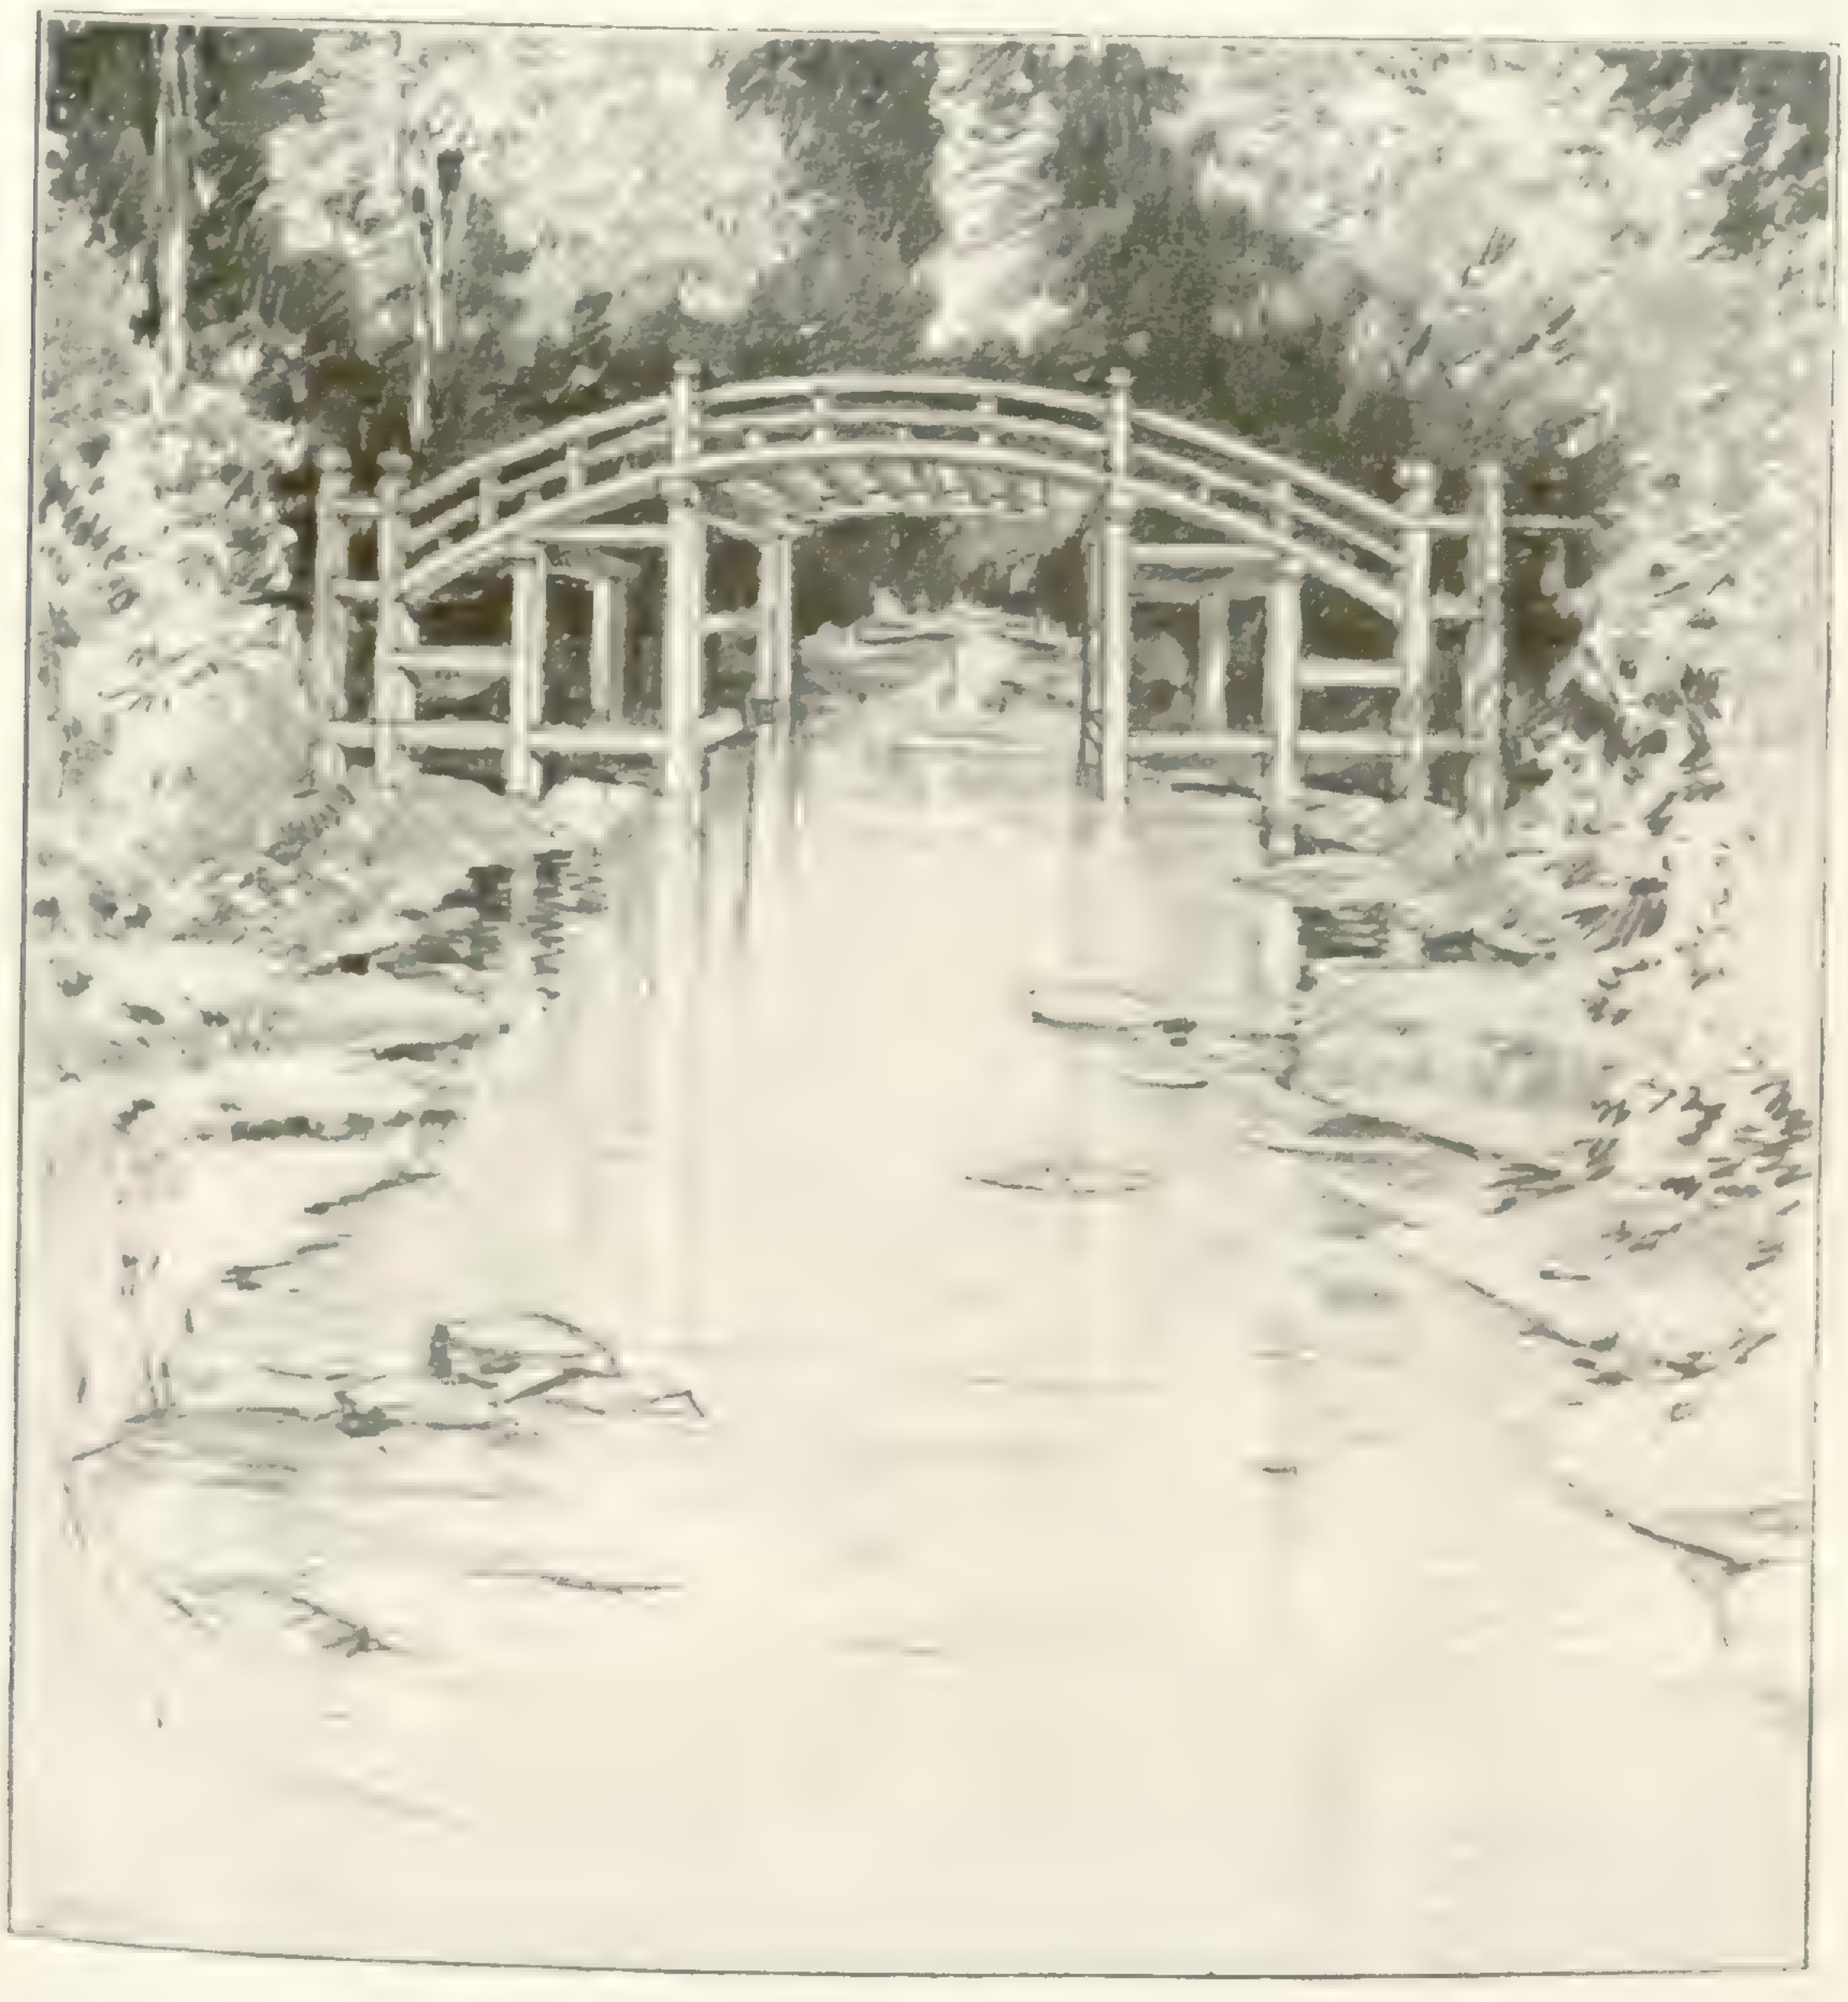
The introduction to this work is particularly well written and interesting. It is by Mr. Rowland S. Protheroe, who briefly reviews the pleasure garden of England, previously alluding to more ancient gardening, and shows how our national style of gardening has resulted from a combination of the Elizabethan and Italian designs. The Dutch or geometric style brought about considerable alterations, but this again gave place to a more natural and free style, and now we have returned to the Old English type, with the improvements that years of experience and the increased wealth of hardy herbaceous and alpine flowers, and flowering trees and shrubs, have brought with them.

Mr. Protheroe points out that, while the broad features of present-day garden designs are excellent, there is room for improvement in the details and the process by which the old English garden has assimilated foreign ideals in its native growth can still be followed. But there is the difficulty of avoiding slavish copies, and as the difficulty and its solution are best illustrated from the suggestions which are made by Japanese art to English designers, "Garden Design" becomes extremely useful as well as interesting and beautiful. Mr. White's adaptation of the model of a Japanese garden house to English needs, as so well shown in the accompanying illustration, is especially interesting. It is an elegant structure, with the floor raised well above the ground to render it the more comfortable and ensure a better view of the garden scenery. Grace and lightness, with the directness and practical needs of English design are well expressed in the beautiful bridge he has designed for spanning a stream of water in park or pleasure grounds.

In the introduction Mr. Protheroe points out that "the resemblances between the essential aims of English and Japanese gardens are so close that the interchange of models seems tempting. Yet the differences are sufficiently great to sound a note of warning. No one, for instance, has carried the art of garden bridge-making to greater perfection than the Japanese designer. But to copy the models in servile fashion would be absurd. Japanese bridges are not direct passages over a watery space, they are places on which 'to linger to catch the cool air of the water, or to watch the goldfish below,' and, often enough, the bridge will turn at right angles, or is wilfully crooked in construction. Yet, because the bridge plays so large a part in garden life, infinite care has been bestowed on its construction, and the English designer may gain many useful hints without copying what in this country would be eccentricity. So, too, the refinement, the suitability to its purpose, the simplicity of the materials, the delicacy and refinement of the effect, the perfect sense of proportion, may all be utilised and translated into purely English design."



JAPANESE SUMMER HOUSE.
Adapted by Mr. J. P. White to the requirements of an English garden.



AN ORNAMENTAL FOOT BRIDGE.
Adapted by Mr. J. P. White from the Japanese style.

Both Mr. Protheroe, by his writing, and Mr. White, by his illustrations and work, have contributed greatly, through the medium of this booklet, to the wide and interesting subject of garden design.

Intermediate House Climbers.—The climbers that thrive the most satisfactorily in a house in which an intermediate temperature is maintained include some of the most desirable climbing plants for the conservatory. Particularly noteworthy are Aristolochia elegans, with peculiarly shell-shaped and quaintly-marked blossoms, Thunbergia fragrans, whose pure white flowers are borne throughout the summer and autumn; Allamanda magnifica, one of the finest of the large golden-flowered allamandas; Stigmaphyllon ciliatum, whose bright yellow flowers are produced in succession for months; Passiflora racemosa, noteworthy among the passifloras for its bright scarlet blossoms, and Clerodendron speciosum, with deep red flowers.—T.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

GENERAL REMARKS. — With more favourable conditions prevailing outside many orchids will be commencing growth, or producing flower scapes. Plants in such conditions will require every encouragement to enable them to develop growth or flower buds satisfactorily. There cannot be any question as to dispensing with a good deal of artificial heat being beneficial, and thus every assistance that can be obtained from the sun should be taken advantage of. On bright mornings the blinds should not be drawn down until there is the possibility of the foliage becoming discoloured or scorched in any of the divisions. The odontoglossum houses, perhaps, need the greatest amount of care, as an excessive amount of light has a tendency to harden and ripen the leaves to such an extent that they fall, and a lot of leafless pseudo-bulbs is an undesirable spectacle. Again, in the afternoon, the blinds should be drawn up the moment it can be done with safety. The ventilators should also be closed, and the temperature of the houses will thus be raised sufficiently to dispense with fire heat to a great extent until late in the evening.

DAMPING.—Where plants are in flower, and where growth is in a forward, yet tender state, it is desirable that the damping of the floors, stages, etc., should be done sufficiently early in the day to permit any excess of atmospheric moisture to disperse before the cooler evening and night temperature is reached. We have always made it a practice not to damp the houses until the normal degree of temperature has been reached. I consider it also should apply to the atmospheric conditions when the lower night temperatures are reached.

VENTILATION.—There is a considerable amount of discretion required in affording air through the ventilators. It is desirable at all times to have a clear, pure atmosphere in the houses, but the methods of procuring this must be varied according to the different departments of the orchid houses, and then only with due consideration of the prevailing conditions outside. Where the blinds are allowed to remain off until the last possible moment it will generally be found that it is necessary to use the ventilators, but when the blinds are lowered, especially when chilly winds are blowing during the spring months of the year, it will be found that there is a rapid fall in the temperature inside, and the ventilators will often have to be closed, so as to obtain a gradual fall in the temperature, such as will not be likely to detrimentally affect the plants. Where wood roller blinds are used, this fall in temperature is most pronounced, and I have no doubt that this is produced by the current of air passing between the blinds and the roof glass, causing a rapid cooling of the latter. This is a point that requires very close attention in the warm divisions, where lath blinds are used. On mild nights a little air admitted by the lower ventilators will be desirable in all the divisions. If the ventilators are opened the last thing at night they can be closed if desired for raising the temperature first thing in the morning.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

VIOLETS.—Owing to the cold weather since Christmas violets are somewhat later in blooming than usual, but no time should now be lost in having the old plants divided up and planted out in their summer quarters. Various methods are in vogue for propagating them, and there is a good deal to be said in favour of pulling off the young runners when planting in the autumn, pricking these out about three inches apart under handlights or in a cold frame, when they will have made sturdy plants by this time for planting out. Failing this method, rooted runners should now be cut or pulled from the old plants, and planted, about a foot apart each way, in a bed previously prepared for them, and if the weather is dry give them an occasional syringing until growth commences, as well as a good sooting, to guard against the ravages of slugs. I prefer an open piece of ground, to which has been added plenty of spent hotbed manure or leaf-soil, this helping them during a dry summer, and providing something for the roots to adhere to when lifting in the autumn.

AZALEA INDICA.—Now that the majority of these plants have gone out of bloom they should have all the old flower stems removed, and those that require it should be potted, using a light compost of peat, leaf-soil, and sand, to which might be added a little loam, but not sufficient to make the compost too binding or close. It is not advisable to give too big a shift, but allow just enough room to use a small rammer between the old ball of soil and the pot. Potting should be done very firmly, and the soil must be just moist, or there will be trouble in soaking it through after potting. Any straggling shoots should be either pruned back or tied in, though in the case of large trained plants it is well to defer the general tying or training until after growth is completed. The plants should be placed in a warm house or pit, where they may have plenty of heat, and be syringed until growth is completed, when they may be gradually hardened off preparatory to standing out of doors.

SALVIAS.—Young plants of Salvia splendens grandiflora must now be potted and kept growing steadily in the cold frame, pinching the young shoots to keep them from growing away and making long sappy wood. The variety Glory of Zurich will be found very useful for blooming in pots (as well as in the open ground), and may be kept in much smaller pots (if well fed than the older variety; it blooms much earlier.

POINSETTIAS AND EUPHORBIAS must now be brought out from where they have been resting, and given a good light position in an intermediate house, and have frequent syringings to encourage the formation of young shoots. These latter should be taken off as soon as long enough for cuttings, taking care not to let them bleed, and to prevent this it is wise to have pots or pans at hand filled with very fine, dry sand, placing the cuttings in these immediately they are cut. The cuttings should be inserted singly in thumb pots or small 60's, afterwards plunging them in a propagating frame with a brisk bottom heat, and keeping them carefully shaded until rooted.—THOMAS STEVENSON, Woburn Place Gardens.

THE FLOWER GARDEN.

SPRING BEDDING.—Every attention should be given to the various subjects employed for beautifying the flower garden during the spring months in the way of staking and tying; the beds should be kept thoroughly cleaned, and the surface soil stirred about them. During continuous spells of dry weather it will be necessary to give copious supplies of water to many, particularly to wallflowers, arabis, and myosotis.

FLOWER BEDS that have been unoccupied during the winter months should now have a thorough dressing of good manure, and the soil either deeply dug, or, better still, trenched, and everything, as far as possible, made in readiness for the bedding season, which will soon be upon us. Though it will not be safe to attempt to put out in the open the more tender kinds of bedding plants before the end of next month, there are many subjects, such as calceolarias, pentstemons, antirrhinums, and many of the more hardy edging plants, which will be much better placed in their permanent quarters by the middle of the month. Great care should be taken to thoroughly harden off everything which has been wintered under glass before planting them out, or a serious check must inevitably follow.

HERBACEOUS BORDERS.—Nearly everything grown in these will now be making new growth, and, in many cases, it will be necessary to reduce the clumps of the more strong-growing kinds, and thinning out the growths of others. Especially is this necessary in the case of herbaceous phloxes, for when well thinned the quality of the flower spikes will be much higher. The surface soil should be neatly hoed once a week, and all plants supported with suitable sticks and stakes before they are allowed to fall about.

SHRUBBERIES.—Assuming the borders of these have been forked over, it will be now necessary to break down the surface finely with a suitable tool, and the best tool for the purpose will depend on the nature of the soil. Many of our more beautiful early-flowering shrubs are now laden with flowers, and it should be borne in mind that the great majority of these, when pruning is necessary, should be cut back immediately the flowers are past their best. All kinds of ulex, if allowed to remain unpruned, become unsightly, and these respond readily if cut close to the ground immediately they begin to go out of flower. The beautiful double-flowering gorse, so much superior to the single varieties both as regards duration and colour, will last for a great number of years and the effect will be much superior if this is cut close to the ground every fourth or fifth season.—E. BECKETT, Aldenham House Gardens.

HARDY FRUITS.

APRICOTS.—The young fruits will, in some instances, be ready for the first thinning, and to carry out this operation successfully it is necessary that the operator should have some knowledge of the varieties, as the smaller-fruiting kinds, such as Breda and Alberge, may, at the final thinning, have the fruits left more closely together without overtaxing the trees unduly, than would be advisable for the larger-fruiting sorts, as Moorpark, Large Red, and Oullin's Early. This work should be carried out gradually, removing, in the first instance, the smallest fruits where they have set in pairs, also all those fruits which are found growing between the branches and the wall, and those which are so situated that they will not have sufficient space to develop. The trees should be looked over once a week, removing a few fruits each time, and selecting those which do not swell up so rapidly as others, but leaving rather more than will be required for a full crop until the fruits have finished stoning, when the final thinning should take place. The larger varieties may have the fruit left at an average of eight inches apart, while the smaller varieties may have one fruit left to every six inches of wall space. Of course, a good deal depends on the condition of the trees as to whether they may be allowed to mature a full crop. It is much more satisfactory to see a tree carrying a medium crop of choice fruits than one with a large crop of small, immature fruits.

DISBUDDING.—This may be carried out simultaneously with the thinning of the fruits. Remove all growths from the back of the branches, and all foreright shoots not required for spurs, laying in only sufficient of the young growths as will be required to replace a portion of the older fruiting wood which will be cut away during the next autumn. Beware of overcrowding, ample space being allowed between the branches, so that the foliage and fruit may have plenty of room and light for their perfect development. Stop all shoots left for spurs at the third leaf, and any subsequent lateral growths to one leaf. This work, like that of thinning the fruit, should be done gradually, so as not to cause any undue check to the trees, by removing at one time a large amount of young growths. Few insect pests attack the apricot, but the Apricot Moth (Tortrix angustiorana) is very troublesome in some seasons. A close examination of the young foliage is necessary for the first tokens of leaf curling, prompt action for the destruction of the caterpillar, by pressing the curled-up leaves between the finger and thumb, will prevent any serious damage to the foliage.—GEO. WOODGATE, Rolleston Hall Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

APRIL 20.

A part of the hall was on this occasion devoted to the auricula and primula show, but there was, nevertheless, plenty of room for a large exhibition of orchids, daffodils, hardy flowers, roses, and other beautiful plants and flowers.

FLORAL COMMITTEE.

Roses were beautifully shown by Mr. George Mount, Canterbury, his large bunches of glorious blooms of Kaiserin Augusta Victoria, Souv. de Pierre Notting, Richmond, Madame Abel Chatenay, Dean Hole, Mildred Grant, Liberty, and Mrs. R. G. Sharman Crawford, attracting a great deal of attention by reason of their size and lovely fragrance and colour. Double primroses and big daisies, and colonies of Primula cashmeriana, P. viscosa, P. denticulata, and alpine auriculas, came from Messrs. W. Artindale and Son, Sheffield.

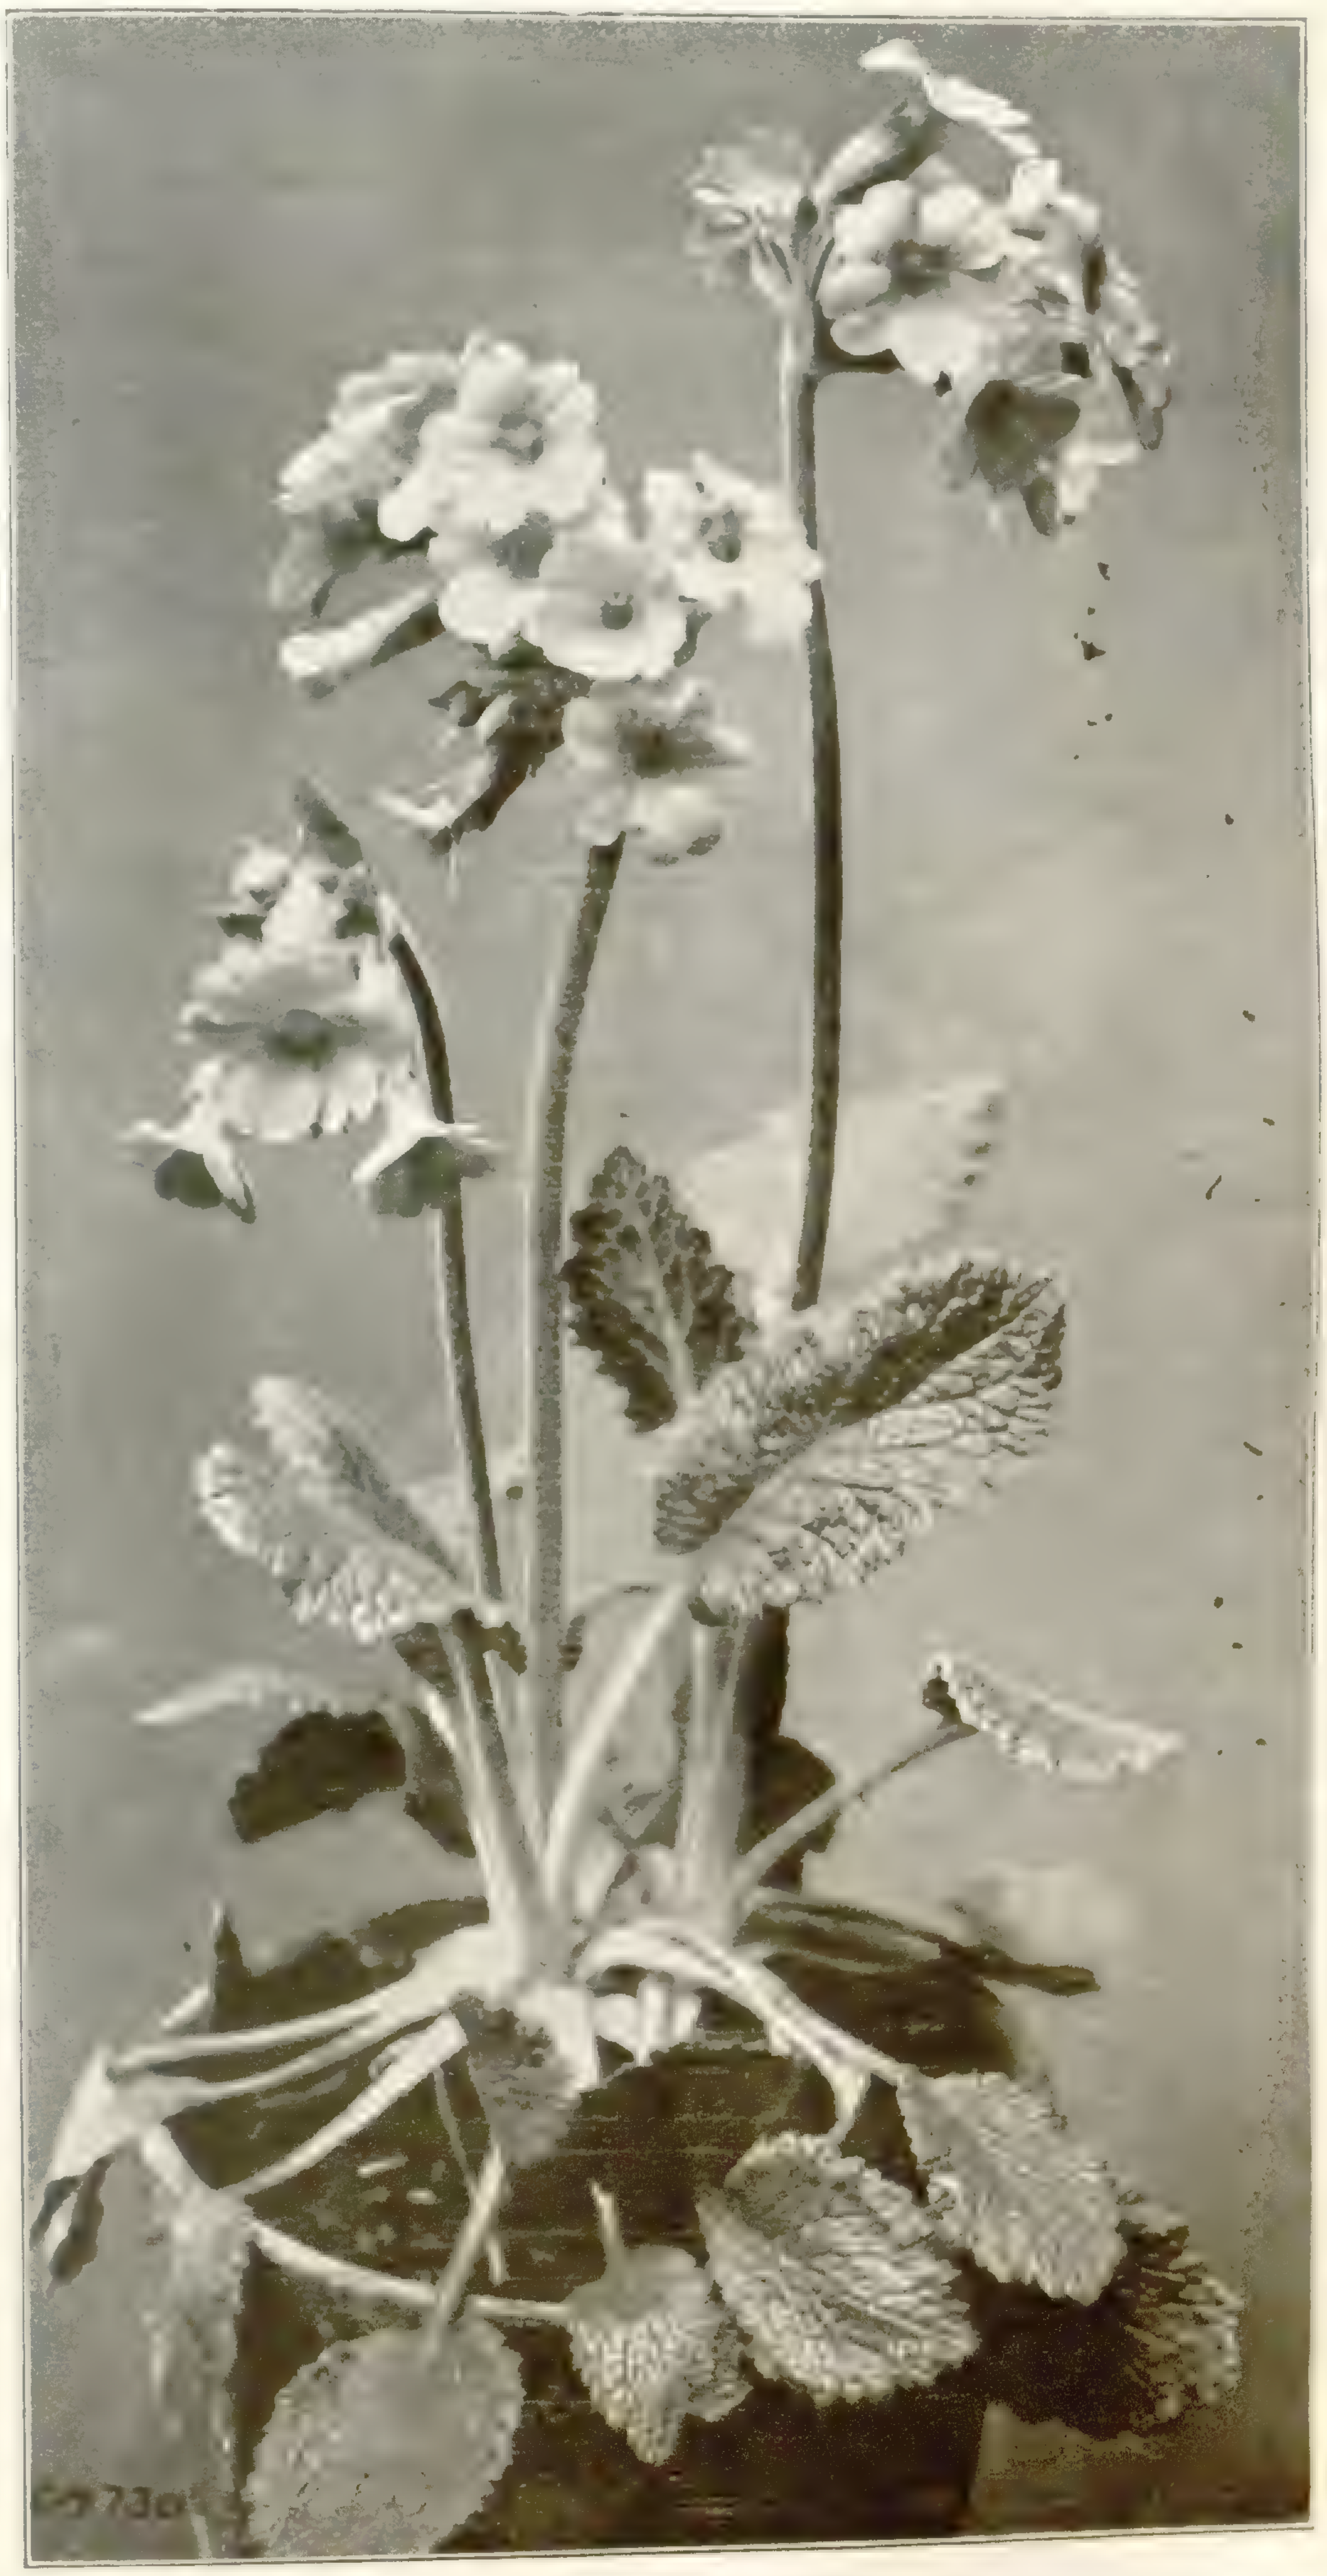
The beautiful Tritonia Prince of Orange, crowded with spikes of soft orange-coloured flowers, was grandly shown by Messrs. Barr and Sons, Covent Garden. This is a grand hardy flower, and worthy of extended culture. Messrs. Storrie and Storrie, Glencarse, Perthshire, showed some lovely polyanthuses, chiefly selfs, carrying fine spikes of beautiful blooms. They also had some fine new gold-laced polyanthuses, remarkable for their vigour and fine markings. Mr. H. C. Pulham, Elsenham, contributed a rock garden planted with small alpine flowers.

A large group of elegant and fragrant cinerarias was shown by Messrs. James Veitch and Sons, Chelsea; these included the very graceful Feltham Beauty cactus-flowered variety, and the pink Feltham Beauty. The same firm sent C. flavescens, a creamy-white hybrid between C. Feltham Beauty and Senecio auriculatissimus, and they staged a few amaryllis and gerbera hybrids. A very fine exhibit of well-grown roses, Lilium longiflorum, and such good carnations as Winsor, Enchantress, White Lawson, and Governor Roosevelt, was staged by Mr. W. H. Page, Langley Nurseries, Hampton. Some good roses, notably Florence Pemberton, W. R. Smith, William Shean, Molly Sharman Crawford, Mons. Paul Ledé, Mrs. Mawley, and Frau Karl Druschki were staged by Mr. G. Prince, Longworth, Berks.

A handsome display of carnations was made by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, their flowers of Rose Pink Enchantress, Beacon, Enchantress, Red Lawson, and Winsor, being unusually good. The same firm submitted a group of acacias, and a group of roses, that included some beautiful flowers of the new sport, White Killarney, very large, white, and fragrant.

Forced shrubs, shown by Messrs. W. Cutbush and Son, Highgate, made a brave show. This firm's carnations were also fine, and among them was their new and magnificent Malmaison variety named Lady Coventry (A.M.); this is undoubtedly the biggest carnation yet seen, and its brilliant colour and fragrance are sure to make it very popular. Double primroses in great variety, daffodils, alpine primulas, and violets were contributed by Messrs. G. Bunyard and Co., Maidstone.

The beautiful new golden-yellow Primula Forrestii, about which we wrote last week, was finely shown by Messrs. Bees, Lim., Liverpool; this is a grand new hardy plant, and deservedly gained an F.C.C. Messrs. J. Cheal and Son, Crawley, submitted Baby Rambler roses and violas. Messrs. Bakers, Wolverhampton, showed a fine lot of freely-flowered polyanthuses, Aubrietia J. S. Baker. Primula Cockburniana, P. denticulata, and P. d. alba, and varieties of Saxifraga decipiens. Messrs. Phillips and Taylor, Bracknell, Herts, showed Primula rosea in quantity, and some excellent auriculas. An interesting rock and water garden arrangement from Messrs. G. and A. Clark, Dover, was greatly admired for its design and free planting of simple flowers.



PRIMULA FORRESTII.

A handsome Chinese species, exhibited by Messrs. Bees, Lim., at the R.H.S. meeting on Tuesday last, when a First Class Certificate was conferred upon it. The freedom with which the rich golden-yellow flowers are produced is shown in the illustration, which is considerably below the natural size.

Messrs. Frank Cant and Co., Braiswick, Colchester, showed Lady Gay rose well, and also Leuchtstern, Tausendschon, and Mrs. F. W. Flight, all grand climbing varieties. Messrs. J. Peed and Son, West Norwood, sent up alpines and daffodils. Messrs. Paul and Son, Cheshunt, sent a group of the single white Sea Shell rose, a very pretty perpetual-flowering Wichuraiana variety. Agate is a double white dwarf variety of the same class. Roses were well shown by Messrs. William Paul and Son, Waltham Cross, Herts, who had freely-flowered plants in pots, their chief varieties being Aennchen Muller, Waltham Bride, the fine white H.T. Albatross, Margaret, and fine blooms of the new and beautiful Lyon Rose.

Violas in variety were most successfully shown by Messrs. Dobbie and Co., Rothesay, some of the most remarkable flowers being Duke of Argyle, Louie Granger, Mary Burnie, Agnes Kay, William Lockwood, Jenny McGregor, Lizzie Storer, and Snowflake. Miss Willmott, V.M.H., Great Warley, showed the bright Arctotis aureola robusta, and Mr. Staward, Panshanger Gardens, sent bunches of sweet violets and of Fortune's Yellow rose. Messrs. H. Cannell and Sons, Swanley, made up a gorgeous exhibit of zonal pelargoniums, cut flowers arranged in large bunches.

Mr. James Douglas, Great Bookham, Surrey, brought up some wonderfully fine show and alpine auriculas, and beautiful bunches of Lady Margaret Boscawen daffodil. Some grand amaryllis were brought up by Mr. A. Chapman, gardener to Lieut.-Colonel Holford, Westonbirt, Gloucester, and the elegant rose-shaded Pinkie was deservedly granted an Award of Merit; Rose Cardinal was another fine thing.

Messrs. J. Carter and Co., High Holborn, had a big central display, filling a circular staging with pots of schizanthuses, with baskets of these graceful flowers suspended overhead. The whole display was a particularly light and pleasing one. Messrs. Sutton and Sons had a fragrant exhibit of Italian hyacinths, white, blue, and pink varieties, associated with the deliciously-scented freesias.

Messrs. H. B. May and Son, Upper Edmonton, showed clematises, statices, dwarf roses, and big pansies, and also had a delightfully cool corner group of choice hardy ferns, the crested and much-divided Lady ferns being especially beautiful. Mr. G. Reuthe, Keston, sent choice early flowers, including rare rhododendrons. Messrs. T. S. Ware, Lim., Feltham, showed anemones, fritillarias, primulas, etc., arranged in a miniature rock garden. Mr. H. Hemsley, Crawley, set up a small group of popular daffodils, and a good selection of hardy heaths. Very interesting was the group of early flowers shown by Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham, which contained camellias and rhododendrons in great variety, daffodils, magnolias, azaleas, and heaths; the rhododendrons were particularly good.

Bougainvillea Rosa Catalina (F.C.C.), with deep rose-pink flowers of fine size and great beauty, was shown by Mr. G. D. Davison, gardener to Colonel Petre, Westwick House, Norwich.

DAFFODIL COMMITTEE.

Miss F. W. Currey, Lismore, Ireland, submitted a beautiful group of daffodils, showing a grand lot of varieties, and setting up good vases of each variety. We noted fine examples of The Geraldine, King Alfred, White Lady, Albatross, Lycidas, The Sirdar, Lord Kitchener, Banshee, Lyric, Lady of the Snows, Incognita, Mrs. Robert Sydenham, Una, and Vivid. Messrs. Barr and Sons, Covent Garden, had a very lightly arranged and pleasing exhibit of daffodils, that included numerous fine sorts, such as Lord Roberts, Peter Barr, Hamlet, Mascotte, Cossack, Seraphim, Chancellor, Pilgrim, Amazon, a beautifully formed new yellow trumpet daffodil as yet unnamed, and a number of the more popular varieties.

In the group of daffodils arranged by Messrs. Pope and Son, Kings Norton, there were good vases of Glory of Noordwyk, Van Waveren's Giant, Lady Margaret Boscawen, Glory of Leiden, Mrs. Betteridge, Boatswain, Sebastian, the new Ben Simonite, Nymph, Bernardino, Will Scarlet, King Alfred, Albatross, and many other beautiful daffodils. Messrs. R. H. Bath, Lim., Wisbech, displayed an interesting and attractive group of daffodils, and in it they showed good blooms of King Alfred, Crystal Queen, Torch, Glory of Noordwyk, Horsfieldi, Lady Margaret Boscawen, Cornelia, Duke of Bedford, Primrose Queen, Fireflame, Golden Ball, and Primrose Phœnix.

Mr. F. Lilley, Guernsey, showed daffodils, tritonias, and tulips. Messrs. G. Jackman and Son, Woking, had roses, and also a pretty collection of early-flowering shrubs and alpines, the latter including some fine Primula cashmeriana. Messrs. R. W. Wallace and Co., Colchester, submitted a group of Darwin tulips, some choice daffodils, Iris Susiana, and a delightful bit of rock garden, with colonies of anemones, tulips, primulas, aubrietias, and fritillarias. Messrs. Hogg and Robertson, Dublin, contributed a collection of daffodils that contained Glory of Leiden, Madame de Graaff, Beauty, Brigadier, King Alfred, Lady M. Boscawen, Seagull, Mr. J. Thorley, and other charming varieties.

Mr. G. Churcher, Woodcote, Alverstoke, submitted a small group of the better-known daffodils, and Mr. W. A. Watts, St. Asaph, had a very good amateur's collection of the better varieties of these lovely spring flowers.

ORCHID COMMITTEE.

A magnificent plant of Odontoglossum Pescatorei, carrying about a hundred and fifty flowers, on three branching spikes, was shown by Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, and secured a cultural commendation. From the same collection came Cattleya Robert de Wavrin (A.M.), L.-c. Dorothy var. splendens, the golden L.-c. Goldcrest (A.M.), very lovely; the fine Odontoglossum Phœbe, Westonbirt var., and a glorious plant of Cattleya Enid, Westonbirt var.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, showed a very bright group of Cattleya Schroderæ, Dendrobium Wardianum, Ionopsidium acaule, Masdevallia Pourbaici, Cypripedium Olivia, and other beautiful orchids. From Sir Trevor Lawrence's collection at Burford Lodge, Dorking, came finely-flowered plants of Dendrobium crepidatum (Cultural Commendation), the lovely Odontoglossum Loochristiense aureo-fulvum (A.M.), and a box full of rare masdevallias. M. Maurice Mertens, Mt. St. Amand, Ghent, showed some very beautiful odontoglossums, all of fine form, and grandly marked; O. amabile, O. Wilckeanum, O. Wiganianum, several hybrids, and an odontioda were the chief features.

Mr. A. W. Jensen, Lindfield, Sussex, showed a fine lot of plants of Cattleya Trianæ and a few odontoglossums. Mr. W. J. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks, showed Odontioda Charlesworthi Theodora, and Odontoglossum Theodora (F.C.C.), the latter a very fine cross between O. Rossi rubescens and O. triumphans—a very pretty orchid, showing evidence of both parents.

Mr. T. W. Thurgood, gardener to H. T. Pitt, Esq., Stamford Hill, N., showed a group of odontoglossums, dendrobiums, cattleyas, and cypripediums, the former being very well represented. The white Cattleya intermedia alba was beautifully shown by Messrs. J. Cypher and Sons, Cheltenham, who also had Dendrobium infundibulum, D. atro-violaceum, Chysis bractescens, Bifrenaria Harrisonæ, Cattleya citrina, Diacrium bicornutum, and other good things.

In the group of orchids submitted by Messrs. Sander and Sons, St. Albans, we noticed Lælio-cattleya Choletiana, Cattleya Schroderæ, Miltonia Bleuana Sander's var. (A.M.), the beautiful Odontoglossum Dreadnought III., a fine cross between O. Prince Albert and O. sceptrum, the brilliant Renanthera Imschootiana, and several pretty little orchises.

Messrs. Charlesworth and Co., Haywards Heath, contributed a beautiful group of orchids, that contained, among other very handsome things, good specimens of Cypripedium caudatum, Epilælia Lionetti (A.M.), a curious cross between Epidendrum macrochilum rosea and L. purpurata; Cattleya Mendeli Distinction, Renanthera Imschootiana, Ærides Fieldingi, Odontioda Bradshawiæ Pleurothallis Birchenallei, and the beautiful Oncidium concolor.

FRUIT AND VEGETABLE COMMITTEE.

The homely cabbage is of unusual interest this spring, after the dreary winter, and the nice green little heads of the April cabbage, shown by Messrs. Sutton and Sons, Reading, were admired almost as much as the orchids and roses.

Mr. R. Staward, gardener to Countess Cowper, Panshanger, contributed good dishes of Duke of York, Britannia, Midlothian Early, Sharpe's Victor, and Early Balfour potatoes, all this year's crop. Mr. J. Poupart, Rainham, showed magnificent asparagus, and gained first prize and a silver Knightian medal for his produce.

An interesting exhibit of small fruits of Cape pineapples was set up by the South African Constantia Fruit Company, Wandsworth Road, Nine Elms, S.W.; the smooth Cayenne fruits were the largest and by far the best in flavour.

CERTIFICATES AND AWARDS.

First Class Certificate.—To Odontoglossum Theodora, from De Barri Crawshay, Esq., Sevenoaks.

To Primula Forrestii, from Messrs. Bees, Lim., Liverpool.

To Bougainvillea Rosa Catalina, from Mr. Davison, gardener to Colonel Petre, Westwick, Norwich.

Awards of Merit.—To Saxifraga decipiens grandiflora, from Mr. Kitley, Bath.

To Hippeastrum Pinkie, from Lieut.-Colonel Holford, Westonbirt.

To Hippeastrum Gracchus, from Messrs. James Veitch and Sons, Chelsea.

To Alpine Auriculas Robert Bruce, Claude Halcro, Ulleswater, and Admiration, from Mr. James Douglas, Great Bookham, Surrey.

To Malmaison Carnation Lady Coventry, from Messrs. W. Cutbush and Son, Highgate.

To Cattleya Robert de Wavrin, from Lieut.-Colonel Holford, Westonbirt.

To Lælio-cattleya Goldcrest, from Lieut.-Colonel Holford.

To Odontoglossum Loochristiense aureo-fulvum, from Sir Trevor Lawrence, Bart., Dorking.

To Epilælia Lionetti, from Messrs. Charlesworth and Co., Haywards Heath.

To Miltonia Bleuana Sander's var., from Messrs. Sander and Sons, St. Albans.

MEDALS.

Silver-gilt Banksian.—Miss F. W. Currey, Lismore, Ireland, for daffodils.

Silver Flora.—Messrs. J. Carter and Co., Holborn, for schizanthuses; Messrs. W. Cutbush and Son, Highgate, for forced shrubs and carnations; Messrs. Hugh Low and Co., Enfield, for carnations, etc.; Messrs. H. B. May and Sons, Edmonton, for ferns; Mr. G. Mount, Canterbury, for roses; Mr. W. H. Page, Hampton, for carnations and lilies; Messrs. William Paul and Son, Waltham Cross, for roses; Mr. G. Prince, Longworth, Berks, for roses; Messrs. James Veitch and Sons, Chelsea, for cinerarias, etc.; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Messrs. James Cypher and Sons, Cheltenham, for orchids; Messrs. Hugh Low and Co., Enfield, for orchids; H. T. Pitt, Esq., Stamford Hill, for orchids; Messrs. Sander and Sons, St. Albans, for orchids; Mr. M. Mertens, Ghent, for orchids; Messrs. Barr and Sons, Covent Garden, for daffodils; Messrs. Hogg and Robertson, Dublin, for daffodils.

Silver Banksian.—Messrs. Pope and Son, Kings Norton, for daffodils; Messrs. R. H. Bath, Wisbech, for daffodils; Mr. G. Churcher, Alverstoke, for daffodils; Mr. W. A. Watts, St. Asaph, for daffodils; Mr. J. Poupart, Rainham, for asparagus; Messrs. Sutton and Sons, Reading, for cabbages; Mr. A. W. Jensen, Lindfield, for orchids; Messrs. R. W. Wallace and Co., Colchester, for alpines, etc.; Sir Edmund Loder, Leonardslee, Horsham, for rhododendrons, etc.

Bronze Flora.—Messrs. Sutton and Sons, Reading, for hyacinths; Messrs. H. Cannell and Sons, Swanley, for pelargoniums.

Bronze Banksian.—Messrs. Dobbie and Co., Rothesay, for violas; Guildford Hardy Plant Company, for alpines; and Messrs. T. S. Ware, Lim., Feltham, for alpines.

National Auricula Society.

WESTMINSTER, APRIL 20, 1909.

The thirty-third exhibition of the Southern Section of this society could not be recorded as a success. The season has been about as bad as it could be, hence many well known growers were conspicuous by their absence, and only in exceptional cases were these spring flowers in proper form; no doubt most growers are about three weeks late in their calculations.

The premier class for twenty-four plants, in not less than twelve varieties, only induced three competitors to take the field. Mr. James Douglas, Great Bookham, had an easy victory with well-developed plants of Favourite, Abraham Barker, Harrison Weir, Rev. F. D. Horner, Queen of Spain, George Lightbody, Queen of Sheba, Marmion, Shirley Hibberd, Ouida, Dinham, H. Wilson, Eucharis, Mrs. Phillips, Colonel Champneys, Abbe Liszt, Lovebird, Sultan, and Lapwing; a very fine collection, in good form. Mr. W. M. Shipman, Altrincham, was second with a much weaker display, the plants being about a fortnight later in development. The best were Favourite, George Rudd, G. Lightbody, Acme, Eucharis, Mikado, and Heatherbell. Mr. G. H. Wilson, Handsworth, Sheffield, was third.

For twelve varieties, distinct, there were but two entries, Mr. James Douglas leading well with the following varieties: Dido, Abbe Liszt. Favourite, Lovebird, Harrison Weir, Beauty, Westhumble, Marmion, Mrs.Phillips, Conservative, Lapwing, and George Lightbody. Mr. W. Smith, Bishops Stortford, made a good display for second prize, staging Mikado, Abbe Liszt, Majestic, and Dr. Hardy in good form.

Fir six dissimilar varieties only Mr. J. Bennett-Poë, Ashley Gardens, staged, his varieties were J. Hannaford, Robert Headley, Mr. Phillips, Mrs. Henwood, and the Rev. J. D. Horner.

A smaller class for four distinct plants secured two entries, Mr. J. Bennett-Poë winning first prize with plants of Mrs. Henwood, Mrs. Phillips, Rachel, and Prince Charming; Mr. F. W. Price, Beckenham, was second with Acme, Olympus, and Mr. Phillips as his best efforts.

For a single specimen, green-edged, Mr. James Douglas was awarded first and third prizes, while Mr. W. Smith secured the second, all staging Abbe Liszt.

The grey edges were not so well represented. Mr. James Douglas was second with Dinham and fourth with George Lightbody; the other plants were not on the table at the time these notes were taken. The white-edged varieties were not numerous, Mr. F. W. Price was first with Acme; Letetia was second (no exhibitor's name); Mr. R. Staward third with Heatherbell.

The selfs were more popular, for there were nine staged, Mr. James Douglas leading with Favourite; Mr. W. Smith came second, and Mr. Bennett-Poë was third with Harrison Weir. Seedlings were not well represented. Mr. W. Smith won first with Majestic, a crimson self; the other sections did not appear to be represented.

The alpine classes were better filled, though they were not up to the standard of former years. For twenty-four plants, in not less than twelve varieties, Mr. James Douglas was again the first prize winner, with a fine set of plants. The varieties were Ettrick, Rosy Morn, Olivia, Argus, Firefly, Robert Bruce, Janet, Brightness, Mrs. James Douglas, Chieftain, Purple Glory, Mrs. Markham, and Dazzle. Messrs. Phillips and Taylor, Bracknell, were second with a weaker exhibit. The best examples were Mrs. M. B. Smith, Mrs. R. C. Cartwright, Thetis, Madiera, Veronica, W. Smith, and Argus.

Mr. James Douglas was again successful with twelve distinct plants. His varieties were Phyllis Douglas, Ulleswater, Mrs. J. Douglas, Chieftain, Firefly, Argus, Rosy Morn, Janet, and Duke of York. Messrs. Phillips and Taylor were second with Majestic, Mrs. Gorton, Duke of York, Thetis, Firefly, and Argus as their best examples.

In the class for six plants Mr. R. Staward, Panshanger, Herts, won first prize with Argus, Teviotdale, Rosy Morn, and some seedlings. Mr. F. W. Price, Beckenham, was second with nice plants of Flora McIvor and Thetis, while Mr. J. G. Baxter, Beckenham, was placed third.

The smaller class for four plants contained five contestants. Mr. R. Staward was the victor, relying chiefly on seedlings; Mr. F. W. Price was second with Alex. Dean and Bluebell; and Mr. C. C. Price, Brentwood, third.

The single specimens with a gold centre brought out some good plants, Mr. James Douglas winning first prize with Chieftain, and second with Claud Halcro; Mr. R. Staward was third.

The white or cream centres did not make such a good show. Mr. F. M. Price won with Argus, Mr. R. Staward taking second position with the same variety, and the third prize with Teviotdale.

In the novices' class for six alpines Mr. C. C. Price was the only exhibitor, but was deservedly awarded the first prize. His varieties were Thetis, Rosy Morn, Urania, Argus, Flora M'Ivor, and Firefly.

Class 20 was for six seedling plants. Here Mr. F. W. Price was placed first with a nice even exhibit, followed by Messrs. R. Staward and W. M. Shipman in the order named.

Mr. James Douglas was the only exhibitor in the class for twelve fancy varieties, and a beautiful exhibit they made, too. The most attractive were Kate Nickleby, Bronze, Caprice, May Day, Nanessa, Innocence, and Epsom.

The classes for primulas were not represented, and this section was much missed by those who remember the fine displays they have made in former years.

The primroses and polyanthus were disappointing, the plants not being up to the standard of former years.

For twelve polyanthus Mr. W. A. Watts, St. Asaph, was placed first, with Messrs. Till and Son second, while the same exhibitors won the primrose prizes in the same order.

For a single primrose, in pots eight inches in diameter, Mr. W. A. Watts won with a white variety; he also won second with a good yellow form; Messrs. Till and Son third. In a similar class for polyanthus Mr. W. A. Watts was first, the Rev. H. A. Soanes second, and Messrs. Till and Son third.

The group of primroses and polyanthuses arranged for effect secured two entries, Mr. S. Mortimer, Swiss Nursery, Rowledge, Farnham, winning easily with a fine strain of well-staged plants. Messrs. Storrie and Storrie, Glenaske, Perth, were second with a fine strain, but it lacked arrangement.

Mr. James Douglas staged a nice exhibit of auriculas in all sections, with some excellent trumpet daffodils. The fancy varieties were particularly attractive.

Mr. J. Crook, Camberley, Surrey, exhibited a choice strain of polyanthuses; the colours were very varied, and the flowers large and bright; evidently a capital strain.

Mr. James Douglas won the prize for the premier plant with a beautiful variety called Queen of Spain, a crimson self.

East Anglian Horticultural Club.

There was a large gathering at the April meeting of this flourishing club. Mr. J. Powley presided. The subject for the evening was a paper upon "Birds in the Garden," given by Mr. H. Goude, head gardener at The Grange, Old Catton, Norwich. The essayist stated that for twenty years he had kept an observation upon birds in the several gardens he had been at, and the conclusion he had arrived at was that, generally, the verdict went against the birds. Throughout the year some kind of bird seemed to be doing some kind of damage in some part of the garden, and this caused extra labour to keep them off trees, plants, and seed beds. Netting, black cotton, scarers, etc., all had to be provided, and for what? For a partial co-operation in the destroying of insect pests. It was only partial, for nowhere had he found that, if left to the resources of birds, the plants had been entirely freed from insects. Moreover, our present knowledge and appliances made it easy now to rid the garden of insect pests thoroughly. Too much sentiment seemed to go in the birds' favour, and

CANARY GUANO,
"The Best in the World"
For GARDEN and GREENHOUSE.

Canary Guano ensures perfection in Flower, Fruit, and Foliage; there is nothing like it for producing luxuriant growth.

Thousands of Prizes are obtained by its use every year.

It is used in the Royal Gardens and by leading professional gardeners and principal trade growers throughout the kingdom.

Sold in Tins, **6d., 1/-,** and **2/6** each. Bags: 14 lb., **3/6;** 28 lb., **6/-;** 56 lb. **11/-;** 1 cwt., **20/-** each.

Canary Guano may be obtained through any Seedsmen, or direct from the manufacturers—

their usefulness was made too large a point. As objects of beauty and adding charm to the countryside birds were all right, but in the garden they were not so useful as most people supposed. The most useful and the most destructive birds were noted, and other points dealt with.

A large number of the members took part in a splendid discussion.

The monthly exhibition provided a capital display. Orchids, from Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, were very good; carnations, from Mr. W. Laws, gardener to G. E. White, Esq., Eaton, were splendid examples; and strawberries were shown in first-rate condition, as were also pot plants.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

DAHLIA TRIALS.—C. F. A., Leighton Buzzard: The Royal Horticultural Society is holding a trial of garden dahlias at its gardens at Wisley this year, but show and cactus varieties are to be excluded from the trials. The plants will be judged entirely on their merits as grown at Wisley, and the judges will consist of a committee of twelve, six nominated by the Royal Horticultural Society and six by the National Dahlia Society, with Mr. William Marshall as chairman. The latter society is holding a trial of cactus dahlias at Shenfield, Essex, under the care of Mr. J. T. West, and a trial of pompon dahlias at Slough, at Mr. Charles Turner's nurseries.

CALIFORNIAN WASH FOR FRUIT TREES.—S. P., Ripon: The winter wash for fruit trees known as the Californian wash is made up from 3lb. to 6lb. of quicklime, 3lb. of sulphur, and 3lb. of salt. These are mixed together, and sufficient water is added to slake the lime; while the whole is hot, as a result of the slaking of the lime, more water is added, and then the mixture is boiled for three-quarters of an hour. After the boiling more water is added to make up ten gallons of wash, and the mixture is ready for use. The great value of this wash lies in the fact that chemical changes occur, and result in the deposition of free sulphur that adheres strongly to the trees sprayed, cementing the eggs of insects, and preventing hatching, and also acting as a fungicide. This wash should be used as soon as made, otherwise it loses much of its value.

BIG BUD ON BLACK CURRANTS.—M. M., Brixham: The microscopic mite (Eriophyes ribis) that causes the big swollen buds in black currants are now migrating from bud to bud and bush to bush. Pick off and burn all the big buds, and then dust the bushes with a mixture of one part powdered quicklime and two parts of flowers of sulphur. This should be used when the bushes are wet, and three dustings should be given, one in March or early April, one towards the end of April, and one during early May. You will be able to give two good dustings and thus minimise the attack. Winter spraying appears to have not the slightest effect upon the black currant bud mite. Where the infestation of new stock is suspected it has been found a good plan to immerse the bushes for ten minutes in water at 115 deg. Fahr. before planting.

PLANTING OUT FORCED BULBS.—E. H. B., Brighton: There is no need to wait until the leaves have entirely died down before planting out the forced bulbs. If watering has been done since the flowers faded, and the plants have been hardened off, they may be planted out at once in the borders, where the leaves will soon ripen.

SWEET WILLIAMS.—S. V., Luton: Sow the seeds at once in good soil either in a cold frame or a nursery bed. Prick out the seedlings when a couple of inches high in good soil, to which some crushed mortar rubbish is added. From this planting fine plants will result ready for being put out in September where they are to flower.

CHERRIES AND PLUMS ON WALLS.—Sol, Sussex: Cut back the shoots of the Morello cherry to about one-third of their length, and bend the portion retained into a horizontal position to secure growth from the basal buds, and thus provide a good foundation for the tree. Later on, when growth has progressed somewhat, train out the rods to form a fan. The plum will need similar treatment, otherwise all the base of the tree will be bare in a few years. Be sure and bend the rods down, when pruned, until new growth starts freely from the base.

HERB PARIS.—O. W. J., Plymouth: Herb Paris is a moisture-loving plant, native of Great Britain. Its name is Paris quadrifolia. The flowers open in May and June, and have four green sepals and four narrow yellow petals, and the foot-high stems carry one whorl of four leaves. The black berry that succeeds the flowers is four-sided. In shady spots near the water herb Paris will grow readily, and it may be increased by root division or from seeds.

PEAS FOR SMALL GARDENS.—W. W., Ottery St. Mary: The tall peas occupy too much space, and interfere so greatly with other crops that they should not be included in selections of vegetables for small gardens. The best peas for such gardens are those that in average seasons attain a height of three feet. There is no great objection to varieties that rise to a height of four feet, except where the soil is strong and deep, and in northern districts; and the objection to them in such cases is the increase in the height of a foot or more. The following are excellent varieties for the production of supplies at seasons when peas can be had in the greatest abundance, and of the highest quality, and that range from thirty to forty-two inches high: Sutton's Prizewinner, The Gladstone, Sharpe's Queen, Sutton's Prolific Marrow, Eureka, and Webb's Senator. Autocrat is an immensely productive variety of high quality, but it grows to a height of four feet, and has, therefore, not been included in the six.

WOUND IN TREE.—T. F. J., Keswick: Cut the wounded part back to clean, healthy wood and bark, and then paint the cut portion with Stockholm tar.

BLUE DAISIES.—G. B. M., Southend: There are many plants that have received the popular designation of blue daisy, notably the greenhouse plant, Agathæa cœlestis, and the annual Brachycome iberidifolia, or Swan River daisy. But, as you suggest the plant you refer to is "a real daisy," we assume it must be Bellis rotundifolia cœrulescens, the blue Moroccan daisy. This is a true daisy, but it will not survive our winters without protection except in the most favourable districts, hence it has never become popular. The leaves are two inches or three inches long, and the flowers, varying from white to blue and blue-purple, are about an inch across.

NAMES OF PLANTS.

M., Gerrards.—Yes; Anemone fulgens.

H. W., Shotley.—Cypripedium villosum.

H. S. R., Broxbourne.—1, Berberis aquifolia; 2, Erica herbacea; 3, Ribes sanguinea.

M. T., St. Albans.—1, Cœlogyne occellata; 2, Cymbidium Lowianum; 3, Begonia President Carnot.

S. C., Chichester.—1, Forsythia suspensa; 2, Anemone pulsatilla; 3, Draba Aizoon; 4, Saxifraga apiculata; 5, S. Burseriana.

S. G., Godalming.—1, Anemone blanda; 2, Adonis amurensis; 3, Muscari conicum Heavenly Blue; 4, Narcissus Johnstoni; 5, N. triandrus albus.

NOW IS THE TIME TO PLANT.
KELWAY'S CELEBRATED GLADIOLI
for the most beautiful effect in beds, and for groups and lines in borders, from July throughout the autumn.

Plant beds and groups of a colour. Or for special beds near the house, or for exhibition use, choice exhibition kinds as below:—

Fine sorts for grouping, flowering bulbs, 15/- to 21/- 100.

Choice named varieties, Collection "2," 34/- per 100.
" " " " "4," 7/6 per doz.
" " " " "6," 12/- " "
" " " " "8," 27/- " "
KELWAY and SON, Langport, Somerset.

GOLD OF THE GARDEN.
NOW IS THE TIME TO PLANT
Herbaceous Plants generally, but especially
KELWAY'S GOLDEN GAILLARDIAS.

Kelway's Gaillardias should be in every garden. The striking effect of their glorious golden and ruddy copper-coloured blooms cannot be obtained with any other plants. Insist on Kelway's, the most improved Gaillardias in the World.

Collection "B," 12/- per doz.
" "C," 18/- " "
Kelway's best named varieties.
KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

NOW IS THE TIME TO PLANT KELWAY'S PYRETHRUMS. Perfectly hardy, flowering in grand profusion, and lasting long in fresh beauty, they are invaluable for a constant supply of cut flowers. Kelway's new single flowered kinds are particularly recommended. Strong plants are sent on receipt of order as follows: Kelway's choice named kinds, Collection "B," 12s. doz.; Collection "C," 21s. doz. Everything free for remittance with order. KELWAY and SON, The Royal Horticulturists, Langport, Somerset.

BUNYARD'S NEW CLIMBER LIST.—This list is now ready, and contains descriptions of over 390 different varieties, including some 40 distinct Ivies and over 65 different Clematis. Many beautiful Illustrations. The plants are all in pots and can be planted at once. Send us a postcard and receive this interesting Catalogue free by return of post; and also full prices and particulars of our two Novelties, Aster "Norah Peters," and "Pyrus Japonica Bunyardi." Now ready for distribution, 5s. each. GEO. BUNYARD and CO., Ltd., The Royal Nurseries, Maidstone.

GARDEN IRON and WIRE WORK of every description.—Garden Arches, Espaliers, Iron and Wire Garden Fencing, Wrought Iron Tree Guards, Rose Screens and Trainers, Iron Garden Stakes, Wood Trellis. Illustrated Catalogue, with prices, free on application. BOULTON and PAUL, Ltd., Manufacturers, Norwich.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

AN APPEAL TO THE GARDENERS OF GREAT BRITAIN.

MANY Professional and Amateur Gardeners are aware of the fact that a fight has been going on for years between the Traders in Poisonous Compounds Protection Society and the Pharmaceutical Society in reference to the sale of poisonous compounds used in horticulture. The new Act, known as "The Poisons and Pharmacy Act, 1908," came into force on April 1st of this year, and Clause 2 reads as follows:—

2. In granting licences for the sale of poisonous substances for use exclusively in horticulture, preference shall be given to nurserymen, florists, seedsmen, and other persons whose business is specially connected with horticulture.

The only correct construction which can be put upon this clause is that it was the intention of the Government that the Borough and County Councils should grant licences to Nurserymen, Seedsmen, Florists, etc., who have been accustomed for very many years—in fact, ever since the articles were introduced—to supply Nicotine Vaporising Compound, Nicotine Insecticide, Weed Killer, etc., etc.

As a matter of fact, they have always held the trade for such poisonous compounds as these, and the gardening public have always sent their orders to them.

The Chemists' Associations all over the country have done their best to bamboozle the licensing authorities by making mis-statements to the effect that they, and not the Horticultural Trade, have been doing this business, and that there is no necessity to grant licences to the Horticultural Trade. Now, as the largest manufacturer of poisonous compounds (XL ALL) used in gardening, I appeal to Professional Gardeners not to place a single order with a chemist.

There is no question that the sympathy of Professional Gardeners will be with their own fraternity, and I shall be much mistaken if Gentlemen Amateur Gardeners who buy these kinds of articles themselves do not take the same view of the situation. Such mercenary greed on the part of the pharmacists, to rob horticultural tradesmen of the business which they have created and introduced to the public should be beneath the action of professional men.

PHARMACY FOR THE PHARMACIST! TRADE FOR THE TRADER!!

I wish to explain to gardeners and amateur gentlemen buyers that should their Nurseryman, Seedsman, or Florist be denied a licence for the time being, they can, all the same, legally book orders for XL ALL poisonous preparations, to be sent on by the manufacturer; and still further, they can legally invoice the goods and receive payment for same. Very little delay will be caused by having to follow this course, and I trust that gardeners generally will show their disapproval of this mean action on the part of the pharmacists of Great Britain by not placing orders with them.

G. H. RICHARDS (XL ALL), 234, BOROUGH HIGH ST., LONDON, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Thinning Out.

Undoubtedly one of the most difficult things to get the amateur gardener to grip and to practice is the absolute necessity of giving a plant full room to grow if he wants it to flourish and display its beauties to the best advantage. In Nature, crowding may be the rule: seeds are produced and scattered in numbers out of all proportion to the number of the plants required to maintain the numerical status of the species. The result is a constant struggle for existence, which, as we know, has had marvellously beneficial results in the evolutionary way. In a garden, however, it is the flower lover's province to prevent such struggles, as far as possible, by giving his protégés every opportunity, and removing every handicap to their welfare. What, however, do we see in innumerable cases? The seeds so abundantly produced are usually collected or supplied on correspondingly liberal lines, a packet containing, as as rule, ten, twenty, or even more times as many seeds as are really required, or can even be grown into plants. The result is, as a rule, the sowing of scores of seeds, within a space that a single plant will require in its adult form. The experienced man knows full well that a seedling handicapped at the outset by being crowded by its immediate neighbours rarely recovers entirely from the weakness thus engendered, but the inexperienced one is too tender-hearted, and cannot bring himself to perform the Herodian decimation which, in many cases, especially with annuals, is absolutely essential to the welfare of the survivors. As a consequence, he obtains a tangled mass of weaklings, in which the natural grace of the individual plant is entirely lost, and its flowering capacity immensely deteriorated. It is true that allowances must be made for accidents, insect depredations, and so on, and to this end, when transplanting to the final stations, more seedlings than one are advisable. When, however, these have established themselves, all but the strongest should be removed if the space allotted to the group is no larger than a properly-grown plant can fill. In this connection it must not be forgotten that above ground light and air are the vital factors of plant life, while below the surface the root systems require free space for their fibres to collect the moisture and earthy salts, which it is their province to transmit to the foliage. Every plant elbowed by another is thus robbed in both directions, above and below, to the detriment of both, the roots intermingling in the soil and competing with each other, while the foliage, by overlapping, deprives the leaves of their full share of light. A common-sense deduction from these facts is, of course, that very thin sowing is advisable at the outset. If the seeds be obtained from a reliable source, the presumption is that all, or nearly all, will germinate if sown under proper conditions, and, bearing this in mind, the amateur would do well to consider how many plants he can properly accommodate, that is, give full growing space to, in their adult stage, and only to sow, say, two or three times as many seeds. In this way most of the evils we have indicated will be avoided, and he will subsequently be spared much of the pain involved in the destruction attending thinning out on healthy lines. To those who are interested in fern culture, and the raising of ferns from their spores, our remarks apply with even greater urgency. Here the microscopic spores may be reckoned in millions, though each one is as fully capable as the largest seed of reproducing a fern, possibly of great size. The tiniest possible pinch consequently may produce an abundant crop, and as ferns resemble all other green plants in their need for root room, light, and air, it is clear that it is an absurdity to sow thickly, and thus handicap them in their babyhood, with the inevitable result that a slaughter of the innocents must follow, or an acre or two of land be devoted to the eventual crop, with an adequate staff of men to do the planting. In short, it is better to give away, or even throw away, surplus seeds, rather than sow in ridiculous profusion, with the handicapping results indicated.

MR. FREDERICK BEDFORD.

Mr. Frederick Bedford has been so long in Ireland that many of his friends believe him to be a son of Erin. For thirty-four years he has been head gardener to the Barton family at Straffan, Co. Kildare, where, under three different members of the family he has made the gardens famous. Mr. Bedford was born at Gosport, in Hampshire, and after serving under his father, and at various establishments, he became orchid grower to the Earl of Londesborough, who at that time had a wonderful collection at Grimston Park, Tadcaster, where Mr. W. Denning was then head gardener. From Grimston he went to act as orchid grower and expert to Mr. B. S. Williams, of Holloway, and he paid numerous visits on behalf of the latter to the leading Continental orchid collections. Mr. Bedford then became head gardener to the Earl of Kenmuir, at Killarney House, and from thence passed on to the charge of the gardens at Straffan House, where Major and the Hon. Mrs. Barton then resided. Mr. Bertram Barton is the present owner of the estate, and our readers know how well Mr. Bedford grows orchids, stove plants, conifers, and fruit and vegetables, and especially how successful he has been with choice hardy plants, notably Cypripedium spectabile and bamboos. It gives us great pleasure to give Mr. F. Bedford's portrait in this issue. We may add that two of Mr. Bedford's sons are following his profession, Mr. Arthur Bedford being foreman under Mr. J. Hudson, at Gunnersbury House.

Noteworthy Newcastle Gardens.—In the issues of the GARDENERS' MAGAZINE for May 8 and 15 we shall give a freely illustrated account of some of the more noteworthy gardens around Newcastle-on-Tyne. The gardens will include those of Howden Dene, Castle Hill, Prudhoe Hall, Oakwood, Holeyn Hall, Jesmond Dene, Heaton Park, and Willow Wood.

Damage by Frost during the Past Winter.—In view of the great severity of the weather during the past winter (1908-9), and the number of plants recently introduced to British gardens, the Council of the Royal Horticultural Society consider it desirable to collect all available information concerning the damage done by frost, in order that it may be made public in the society's "Journal." Forms have been provided for entering the information, and those who have not received copies may obtain them, on application to Mr. F. J. Chittenden, R.H.S. Laboratory, Wisley, Ripley, Surrey. The extent of the damage done may not be apparent until the middle or end of May, but it is suggested that notes of the apparent damage should be made at once, and checked subsequently at the time the plants should be in full growth. As the report will be of great practical value to all who are engaged in gardening, those who are able to do so should make returns.

The Royal Gardeners' Orphan Fund annual festival dinner will take place at the Hotel Cecil, Strand, London, on Thursday, May 6, at 6.30 for 7 o'clock. His Grace the Duke of Rutland will preside, and there is every prospect of a large, influential, and successful function.

Gardeners' Royal Benevolent Institution.—In aid of this excellent charity Mr. Edward Sherwood is arranging for a performance, on Wednesday, May 12, of a new musical play, entitled "In Cyderland," at the Cripplegate Theatre, Golden Lane, E.C. The play has been written by Mr. R. Carey Tucker, and the music composed by Mr. Edward Sherwood. The full orchestra, by the courtesy of "The Hurst and Son" Musical Society, will be under the direction of the composer. The prices range from 3s. to 10s. 6d., and tickets may be obtained from Mr. G. J. Ingram, 175, Victoria Street, S.W.; Mr. N. N. Sherwood, Dunedin, Streatham Hill, S.W.; and Mr. Edward Sherwood, 152, Houndsditch, E. The doors will open at 7.30 p.m., and the performance terminate about 10.45 p.m. The Cripplegate Theatre, we would add, forms part of the Cripplegate Institute.

The Eaton Hall Gardens are remarkable for their annual displays of daffodils, and in no season has Mr. N. F. Barnes provided for the entertainment of his noble employers a more delightful display of these beautiful flowers than in that through which we are now passing. With his customary kindness, the Duke of Westminster opened the gardens and grounds to the public on two days to enable them to participate in the feast of flowers, and on the 20th and 21st ult. the large numbers who passed the gates proved to demonstration that the privilege was highly appreciated by the residents in and near Chester. Choice varieties are extensively cultivated, and such varieties as Emperor and Empress, Sir Watkin, Grandee, and Poeticus varieties are grown in immense numbers in the grass.

The Savatier Herbarium.—We learn that Madame L. Raoul, the daughter of the late Dr. P. A. L. Savatier, having offered the herbarium of her father to Kew for purchase, the whole of the collections included in that herbarium have been acquired for the Royal Botanic Gardens. They consist of two sets: one, numbering 730 specimens, comprises only Japanese plants, whilst the other, which numbers 735 specimens, is made up of several collections, mainly from Tahiti, Peru, the Straits of Magellan, and other parts of South America, under the general description "Campagne de la Magicienne." M. Savatier was a doctor in the French Navy, and in this capacity travelled largely, and was ten years in Japan with the French Naval Engineers. The Japanese set is of particular interest and value, as it goes a long way to illustrate the "Enumeratio Plantarum in Japonia Sponte Crescentium," by Franchet and Savatier, the first comprehensive and methodical attempt at a flora of Japan on a scientific basis. Savatier's Tahiti plants were worked out and incorporated by Drake del Castillo in his "Flore de la Polynésie Française," and furnish, therefore, authenticated and important material for the study of the flora of Eastern Polynesia. The American plants, on the other hand, are only partly named, but as they are well localised, and, like the rest, well preserved, they represent a valuable accession to the collections at Kew.

Excess of Magnesia in Soil.—Dr. Voelcker, in his report, made as consulting chemist to the Royal Horticultural Society, instances an interesting case of soil from Malvern, where currants were said to be very unhealthy in appearance. Dr. Voelcker analysed the soil, and found that there was not any one constituent that was markedly deficient, except, possibly, the organic (vegetable) matter and the nitrogen derived from this source. There was a very fair supply of potash; in phosphoric acid the soil was distinctly rich, while the amount of lime could not be said, in itself, to be low. A remarkable point, however, brought out by the analysis was that the amount of magnesia (1.39 per cent.) contained in the soil was more than double that of the lime (.60 per cent.). This is a matter to which, says Dr. Voelcker, my attention has been of late directed in a somewhat special way. Moreover, experiments conducted by myself at the Woburn Experimental Farm have brought out very clearly the influence which magnesia may exert on the crops of the farm. To briefly summarise the information gained on these points, it would appear to be brought out that whenever the proportion of magnesia in a soil exceeds the lime that is present, conditions unfavourable to the successful growth of crops are produced. I am of opinion that to this may very well be attributed the failure of the currant bushes in the present instance. The subject is still under investigation, but I certainly believe that the best thing to do in such a case as that mentioned is to apply lime liberally, for, while it is impossible to take the magnesia out of the soil, it is possible to reduce its preponderance by the addition of lime.

Poisonous Excretions of Roots.—Investigations have been carried out by Mr. F. Fletcher, deputy director of agriculture in the Bombay Presidency, of the excretions of roots of plants. As the result thereof, Mr. Fletcher has arrived at the following conclusions: (1) All plants excrete substances which are toxic, both to themselves and to other species; (2) the quantity of toxic material excreted by the different crops varies, when reckoned per unit area of a field sown in the ordinary way; (3) sensibility to the excreted substance varies with the plant; (4) the substance excreted by all crops is apparently identical. The nature of the substance, which may be an alkaloid, is being investigated. The toxic substance appeared to have an injurious effect on adjacent crops according to the extent to which it was distributed through the soil, while its effect on subsequent crops grown on the same land would depend on the extent to which the roots came into contact with it, especially by occupying the same layer of soil.

A Big Apple Orchard in Kansas.—Secretary Coburn, of the Kansas State Board of Agriculture, has published a glowing account of the enterprise of Judge Wellhouse, of Topeka, Kansas, in apple-growing. He has over 1,600 acres devoted to this fruit, which he began to plant in the latter part of the "seventies." He must have had a strong faith in the suitability of his district for apples, as he began by planting 437 acres, which his neighbours deemed as a great act of folly. He has now gathered and sold twenty-six crops, amounting to over half a million bushels. The largest crop was 80,000 bushels in 1890, and the smallest was 488 bushels in 1899. The largest crop sold for over 50,000 dollars; but if there were 1,600 acres then the gross return was only £12 5s. per acre, which is not much to boast about, and the smallest must have left a very heavy loss. If the area was 1,600 acres in 1890, the yield was only 50 bushels per acre, which is a poor maximum, and even if only 1,000 acres were bearing fully then, 80 bushels per acre cannot be regarded as remarkable. The Judge may have been enterprising enough, and his orchards must number among the big things in the United States, but the results of his enterprise, supposing the figures to be correct, we could easily beat in this old country of ours.

An American National Sweet Pea Association is in course of formation, and the leading spirits are Messrs. Harry A. Bunyard and A. T. Boddington, of New York. The latter has been in communication with the N.S.P.S. of this country, for the purpose of obtaining a knowledge of the working of the latter body. Mr. H. Turner, president of the New York Florists' Club, and Mr. W. Atlee Burpee, of Philadelphia, are lending their influence and financial aid to the new venture, and already June 14 is the date booked for a sweet pea exhibition and inaugural meeting at New York. If the American society and the British one work hand in hand in the matter of trials, too-much-like varieties, synonymy, etc., great good will result, and sweet pea lovers will be grateful.

Presentation to R.H.S. Library.—Professor A. H. Church has presented three books which he had had privately printed, to the Royal Horticultural Society's Library. These are catalogues of some 6,000 manuscripts, scarce pamphlets, etc., contained in the library of the Royal Society, and dating from about 1606 to the beginning of the nineteenth century, containing many interesting references to well-known botanists and other scientific men of this and foreign countries.

Plants and Flowers for London Workers. — Lord Monkswell, Chairman of the Kyrle Society, writes: "Allow me again to appeal through your columns to those who have gardens to send us flowers, plants, seeds, or bulbs, to bring some brightness into the lives of the poor workers of London. Lovers of flowers can easily understand the pleasure they bring to those whose lives are spent among the dull and crowded streets and tenements of London. Flowers should be gathered in bud, before the sun is on them, and sent tied up in bunches. A postcard to the hon. secretary, Kyrle Society, 2, Manchester Street, London, W., will receive a prompt reply giving addresses where flowers may be sent direct."

Tree Carnations as Border Plants.—We have already pointed out the value of Perpetual Carnations for beds and borders, and are therefore glad to find the matter dealt with in the current issue of the "R.H.S. Journal." It is there stated that "the best results outdoors are obtained from old plants that have been blooming through the previous winter and spring: they should be planted out at the end of May, on a sunny but sheltered border, not cutting them back at all, but putting them out just as they are. For a time they will appear very shabby, and be somewhat of an eyesore, but in a very short time new growths will be made which will produce an abundance of blossoms during the late summer and autumn. The soil for the plants ought to be deeply dug, say eighteen inches deep, adding a liberal supply of well-decayed manure or well-rotted leaf soil; and if the soil is stiff and heavy, coarse sand or road grit may be used to keep it porous and warmer. If the weather is very dry after planting, copious supplies of water should be given until the plants are well established, and a good syringing occasionally after hot days is very beneficial. Later on, when the plants are established, frequent hoeing to keep a loose surface is called for, as it not only conserves moisture, but the plants thrive the better for it, and respond much better to this treatment than to feeding with chemical or natural manures. We should advise that no manure of any kind be given to the plants after putting them out in the border, as it tends to the production of foliage at the expense of the quantity and quality of the flowers."

The Stone Seat in the Kew Arboretum.—Inquiries are from time to time made, says the "Kew Bulletin," as to the stone seat among the beech trees towards the southern end of Kew Gardens. The seat, which was placed in the position it occupies in February, 1904, was presented to Kew by a group of friends of the late Miss Cassell, who was for twenty years lady superintendent of the College for Working Women. It was provided as a memorial by past and present students of the college, to express their sense of Miss Cassell's unique personality. "That it should be a resting-place in sight of sky and trees in such an altogether beautiful place as Kew, and within reach of working Londoners, seems, in accordance with her life spent in working for the working poor, what she would like," is a sentence which occurs in a letter on the subject, written by Mrs. Maclehose, at whose instance the memorial was erected. In the same letter Mrs. Maclehose says: "We should like some motto or words carved on it, but no obviously memorial words—no names." The actual inscription is: Life—the gift. Let us take hands and help this day we are alive together. Look up on high and thank the God of all.

BUNCH PRIMROSES.

We often hear it said that no garden is complete without this, that, or the other flower, and it is certainly true that there would be a sense of something missing if we went over a garden in the spring and saw no members of the primrose family. The single and double solitary-flowered primroses of various colours, as well as the polyanthuses, are very old inhabitants of our gardens, but the primrose-polyanthus is of comparatively recent introduction, though now well-known everywhere. The flowers in various shades of crimson, pink, yellow, mauve, and white, coming up at first as ordinary solitary-flowered primroses, but later on in polyanthus, or bunch-flowered form, the individual flowers suffering little, if any, diminution of size by being bunched. It may be said by some that they will grow anywhere without any difficulty, the plants lasting for years, and reproducing themselves from seed. This is by no means universally true, as I know only too well from experience, and many, especially those on the London clay, find that the choicer sorts, if not all, need some little cultivation.

The foliage of the primrose family, when well grown, is very beautiful, and forms a pleasing relief to the flowers, and it would be worth while giving them good cultivation for this alone. A soil that is both rich and moist produces the best results in flower and foliage, and, if in partial shade, all the better. It does not matter if they are not exposed to full sunshine in the summer. If we study the situation in which the primrose grows in a wild state, we shall be helped in choosing positions for the bunch primroses in our gardens. Early in the summer, and even in July, we are usually told that "now is the time to sow" seeds of various things, and among them primroses, and so it may be, but seed sown at that time will not produce flowering plants the following spring. The earlier the seed is sown the better, February being the best month. Heat is not necessary, perhaps not advisable, and I always sow the seed in pans and set them in an unheated frame in February, and in a month or six weeks, according to the character of the season, they are up. They are very slow in development above ground at that stage, though they are making good roots, and they should be ready to prick out in a rich bed of soil in partial shade sometime in May, putting the seedlings six inches apart, and keeping them moist, if the weather is dry, until they are well established. Seed may also be sown in the open in April, but if choice seed has been obtained—and it is advisable to purchase the best—it is better to obtain the maximum number of seedlings possible by careful raising, and we are not likely to have too many if the strain is good. Some save their seed from selected plants, and sow it as soon as ripe in a nursery bed, pricking out the young plants early the following spring. Very good plants are obtained in this way under favourable conditions, but if the situation or climate is not favourable, many of these, probably the best varieties, will come to grief during the winter.

Though the young plants will appear to be making little progress most of the summer, they will go ahead in September and early in October, making fine plants for putting out in their flowering positions—along the margins of shrubberies and nut walks, in beds, grouped among the perennials in the mixed borders, etc., not forgetting their use in pots. Though they may be successfully moved at any time in the spring, even when in bloom, the best results are obtained if the plants are potted up in October, made firm in good, rich soil in thirty-twos, or, in the case of extra fine plants, twenty-fours. They should then be put in an unheated frame for the winter, and given weak liquid manure occasionally, increasing the frequency and the strength as spring approaches, when the plants will grow most luxuriantly, producing large dark green leaves, with fine trusses of blossom, and making most decorative objects for the house. If they are brought into a cool, not a cold house, in January, they may be obtained in flower during those chilly weeks of early spring when everything is ready to come out, but nothing does because of the biting winds, and there is no time when we appreciate them more. We too often see primroses dotted about in the mixed borders, but their effect is lost there, as they are not intended by Nature for such use, being usually found in a wild state growing more or less closely together.

The method of propagation adopted must depend upon the suitability or otherwise of the soil and situation. In some gardens plants will last for several years without being touched, whilst in others they are of little use after the first year. When this is the case, there is nothing for it but to raise a stock from seed every year. Where primroses are indigenous in the neighbourhood, a better way is to gradually build up a stock of the finest varieties, either by buying plants of the best named sorts or by sowing some choice seed every year, and retaining the best varieties for propagation by division. In suitable soils this latter process is a very simple one, though with me the plants obtained in this way are never so good as those raised from seed. As soon as the flowers of the plants which it is desired to propagate have lost their beauty, they should be taken up and be cut into pieces with a sharp knife. Every piece with any root attached will make a flowering plant for the following season. Whether one cuts them up into the smallest pieces possible, or just divides the old plants enough to give them room for proper growth, depends upon the scarcity or otherwise of the stock, though small portions with a nice piece of root properly belonging to them will make much stronger plants than larger pieces with less root.

ALGER PETTS.

Psychotria (Gloneria) jasminiflora.—This is one of the whitest of all white flowers that I am acquainted with, and at the same time it blooms with great freedom at this season of the year. It is a native of Brazil, and therefore needs the temperature of a stove for its successful culture. This psychotria forms a neat-growing evergreen shrub, clothed with ovate leaves about three inches in length. They are smooth and bright green on the upper surface, and of a glaucous whiteness underneath. The flowers, which very much suggest those of a bouvardia, are borne in compact terminal clusters, and, as above stated, they are of unusual whiteness. This psychotria needs careful attention, particularly in the matter of water, as the roots are somewhat delicate, and are quickly injured by an excess of moisture. Cuttings of the half-ripened shoots strike root readily if they are put into pots of sandy soil in a close propagating case. The "Kew Hand List" contains seven species of psychotria, but, except this, they are almost unknown. One kind that often used to be met with some years ago is P. cyanococca, whose flowers are uninteresting, but the berries which succeed them are bright blue, and decidedly ornamental. This last-named species is a native of Nicaragua, and was introduced by the late Dr. Seemann about forty years ago.—W. T.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM THEODORA.

This is a remarkable, as well as a beautiful odontoglossum, and one of the Rosefield successes. It is the result of crossing O. Rossi rubescens with O. triumphans. The flowers are very neat, of fair size, and pretty colouring. The sepals and petals are heavily barred and blotched with deep red-purple over a yellow ground, the latter showing between the dark colouring, and also at the tips of the petals. The large lip is prettily frilled, white, with a purple tinge, and a yellow crest behind the semicircular red-brown blotch. F.C.C., R.H.S., April 20. Mr. De Barri Crawshay, Rosefield, Sevenoaks.

ODONTOGLOSSUM LOOCHRISTIENSE AUREO-FULVUM.

In this variety the bright yellow of the sepals and petals show up the deep, rich red-brown blotches and bars finely. The lip is white, with a few brown spots, and a yellow crest. The flowers are of excellent shape, and the variety is very distinct and attractive. A.M., R.H.S., April 20. Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

CATTLEYA ROBERT DE WAVRIN.

A large-flowered, handsome hybrid between C. Schroderæ and C. Schilleriana. The broad white petals are faintly tinged with rose, as also are the sepals. The lip is deep rosy-mauve, with a yellow throat, and some dark veins at the base. A.M., R.H.S., April 20. Lieut.-Colonel Holford, Westonbirt, Tetbury.

LÆLIO-CATTLEYA GOLD CREST.

A very beautiful bright-yellow orchid, derived from the intercrossing of Cattleya Schroderæ and Lælia Cowani. The blooms are of moderate size, borne freely in an erect spike. The colour is clear bright yellow throughout. A.M., R.H.S., April 20. Lieut.-Colonel Holford, Westonbirt, Tetbury.

EPI-LÆLIA LIONETI.

A distinct and curious hybrid between Lælia purpurata and Epidendrum atropurpureum. The flowers are bright purplish rose, carried in an erect spike. A.M., R.H.S., April 20. Messrs. Charlesworth and Co., Haywards Heath.

DAFFODIL QUEEN OF THE WEST.

A magnificent clear golden-yellow daffodil belonging to the Ajax, or large trumpet group. The flowers are large, carried on fine stems, and the variety is sure to become popular for market. F.C.C., R.H.S., April 20. Messrs. Walter T. Ware, Lim., Bath.

BOUGAINVILLEA ROSA CATELINA.

This handsome bougainvillea probably possesses a strain of B. speciosa in it, for, as yet, it has not flowered in a small state. It is very beautiful, and, from its showy rose, pink-shaded bracts, all the magenta-purple that spoils B. glabra from a decorator's point of view, has been eliminated. The variety was found at Las Palmas, and appeared to be the only one of its kind in the Grand Canary. F.C.C., R.H.S., April 20. Mr. G. Davison, gardener to Colonel Petre, Westwick, Norwich.

PRIMULA FORRESTII.

This new primula has been already referred to, and figured in these pages (p. 325). It comes from a considerable altitude in Yunnan, and has proved hardy in this country. In old plants the root stocks grow to a considerable length, but the plants shown were very neat, and in quite small pots. The flowers are yellow, but the shade varies almost to orange, and they are sweetly-scented, as are the green leaves. The style of the plant is suggestive of a strong-growing, large-flowered cowslip. F.C.C., R.H.S., April 20. Messrs. Bees, Lim.

SAXIFRAGA DECIPIENS HYBRIDA GRANDIFLORA.

A very effective mossy saxifrage, growing about four inches high, and carrying a great profusion of deep crimson flowers. The mossy foliage and the deep-hued stems are further attractions. A.M., R.H.S., April 20. Mr. J. Kitley, Bath.

AURICULAS.

Admiration.—An effective flower of the grey-edged alpine type, with a clear pale-yellow centre. A.M., R.H.S., April 20. Mr. Jas. Douglas, Great Bookham.

Claud Halcro.—A beautiful alpine variety with crimson and bronze-shaded segments surrounding the clear yellow centre. A.M., R.H.S., April 20. Mr. James Douglas, Great Bookham.

Ulleswater.—A purple alpine auricula with creamy-white centre. A.M., R.H.S., April 20. Mr. Jas. Douglas, Great Bookham.

Robert Bruce.—This alpine variety has a pale-yellow centre, and greyish segments. A.M., R.H.S., April 20. Mr. Jas. Douglas, Great Bookham.

HIPPEASTRUMS.

Gracchus.—A splendid flower, large and shapely, and of an intense and deep crimson colour throughout. A.M., R.H.S., April 20. Messrs. Jas. Veitch and Sons, Chelsea.

Pinkie. — A beautiful variety, heavily shaded and veined with rose over a white ground. Fine in form, size, and substance. A.M., R.H.S., April 20. Mr. A. Chapman, gardener to Lieut.-Colonel Holford, Westonbirt, Gloucester.

CARNATION LADY COVENTRY.

This is one of the very finest of Malmaison carnations, as it combines fragrance with immense size and splendid colour. The variety grows well and flowers freely, and a plant in a 3in. pot carried one grand bloom. The colour is deep crimson. A.M., R.H.S., April 20. Messrs. W. Cutbush and Son, Highgate.

ROSE MARECHAL NIEL.

The almost entire absence of this rose from ordinary gardens is, I fear, a proof of its waning popularity. Nowadays, varieties are preferred that give double the number of blooms and little trouble. Difficulties common to the culture of this old favourite are shunned rather than tackled. The finest blooms for size, form and colour that I ever saw were the produce of standards growing on the ordinary hedge briar, planted at the foot of the southern side of a mansion eight miles north of York. I have occasionally seen fairly good blooms on outside trees in the south, but never saw a desirable full crop.

I cannot but think that soil has an effect upon the growth, or why should we see such good results in various parts under glass, and from stocks which some think quite useless? For instance, plants growing upon their own roots will give all that is necessary in some gardens, while in others it is the reverse. I think, upon the whole, the best general results are obtained from plants worked on the ordinary briar, especially if the stock was, and is, healthy and vigorous. It is useless to employ old hide-bound stocks; we want vigour.

As to the principle of close pruning after flowering, with a view to getting growth for next season's flower crop, the bulk of those who grow this rose for profit, practise that plan, cutting back to within a few inches of the base. Of course, there is still another reason why this rose is not so much grown, i.e., owing to its flowering but once in a season—nowadays it is continuity in flower production that makes favourites of one sort over another; and, again, Maréchal Niel has rather short flower stems, which all too often are weak, allowing the flowers to droop in vases if they are not artificially supported, and seldom can we obtain them with long stems, such as are nowadays favoured, as Liberty, Mrs. John Laing, Mdme. Abel Chatenay, and such like.

E. Molyneux.

OUTDOOR CULTURE OF PITCHER PLANTS.

I have been asked to give a short account of the manner in which the North American pitcher plants are grown in the open at Leonardslee. I would first mention that these plants have been established for some years in the gardens here, and we continue to raise a few from seed every season, and as the plants bloom freely they produce a beautiful effect when in bloom. The flowers are bright crimson, and Eriophorum angustifolium, growing freely between the plants, gives a contrast that is very pleasing, these being white. There are growing here also good examples of Darlingtonia californica, a distinct and handsome species. The darlingtonias and sarracenias occupy large beds that are in a moist position, fully exposed to the sun throughout the day, and they thrive well under these conditions. In the beds also are the charming sundews Drosera rotundifolia and D. longifolia.

In the cultivation of outdoor pitcher plants a warm position should be chosen, and this should be fully exposed to the sun, and sheltered from the cold winds. A position facing due south is the best, and it must be a damp one. Where there is water coming through the soil, such as one often finds where rushes, etc., grow freely, will be suitable. There must not be too much water, or the plants may be washed away in winter, nor must it become dry in summer, as, in the latter case, the plants will quickly die. In preparing the ground, the top spit of turf must be taken off and laid grass downwards; then prepare some good peat and sphagnum moss, which should be chopped up and laid to the depth of 5 or 6in. over the ground in which the plants are to be grown. They should then be fixed firmly with a mixture of the same material, pressing the sphagnum well up to the collar of each one. The plants should be protected with some branches to screen them from the sun and wind until growth has commenced.

They are planted at Leonardslee in eight or ten positions; and some of the specimens have from 100 to 200 pitchers. I have sown some in a small ditch, with Pinguicula grandiflora, where they are growing. Of course, they must be protected from animals or anything likely to run over them. Mice are very fond of nibbling them, so that a sharp look-out is necessary and traps be set.

I would mention that the sarracenias make a beautiful display of colour through the dull months of the year; during the months of November, December, January, and February, they are simply lovely, and form a great attraction. The seed vessels are taken off during October, when seeds are generally ripe and ready for sowing; the seeds may be sown in a box or pan, and kept in a cool frame, or they may be sown on the spot where they are intended to grow. In either case, they must be kept moist; if they are sown on chopped peat and sphagnum, it would be well to place a little more sphagnum over the seed, as the seedlings would push through this covering quite easily. The grower must have patience in raising these plants, but, as a rule, the seedlings make their appearance in three or four months.

W. A. Cook.

Leonardslee Gardens, Horsham.

USEFUL GUIDE TO GARDEN WORK.—A handy all-round guide to work in the garden month by month is the Gardening Year Book, by George Gordon, V.M.H., price 1s. net from booksellers, or by post 1s. 3d., from W. H. and L. Collingridge, 148 Aldersgate Street, London. The book is freely illustrated and the cultural details thoroughly practical and up to date.

PREPARATION OF BEDDING PLANTS.

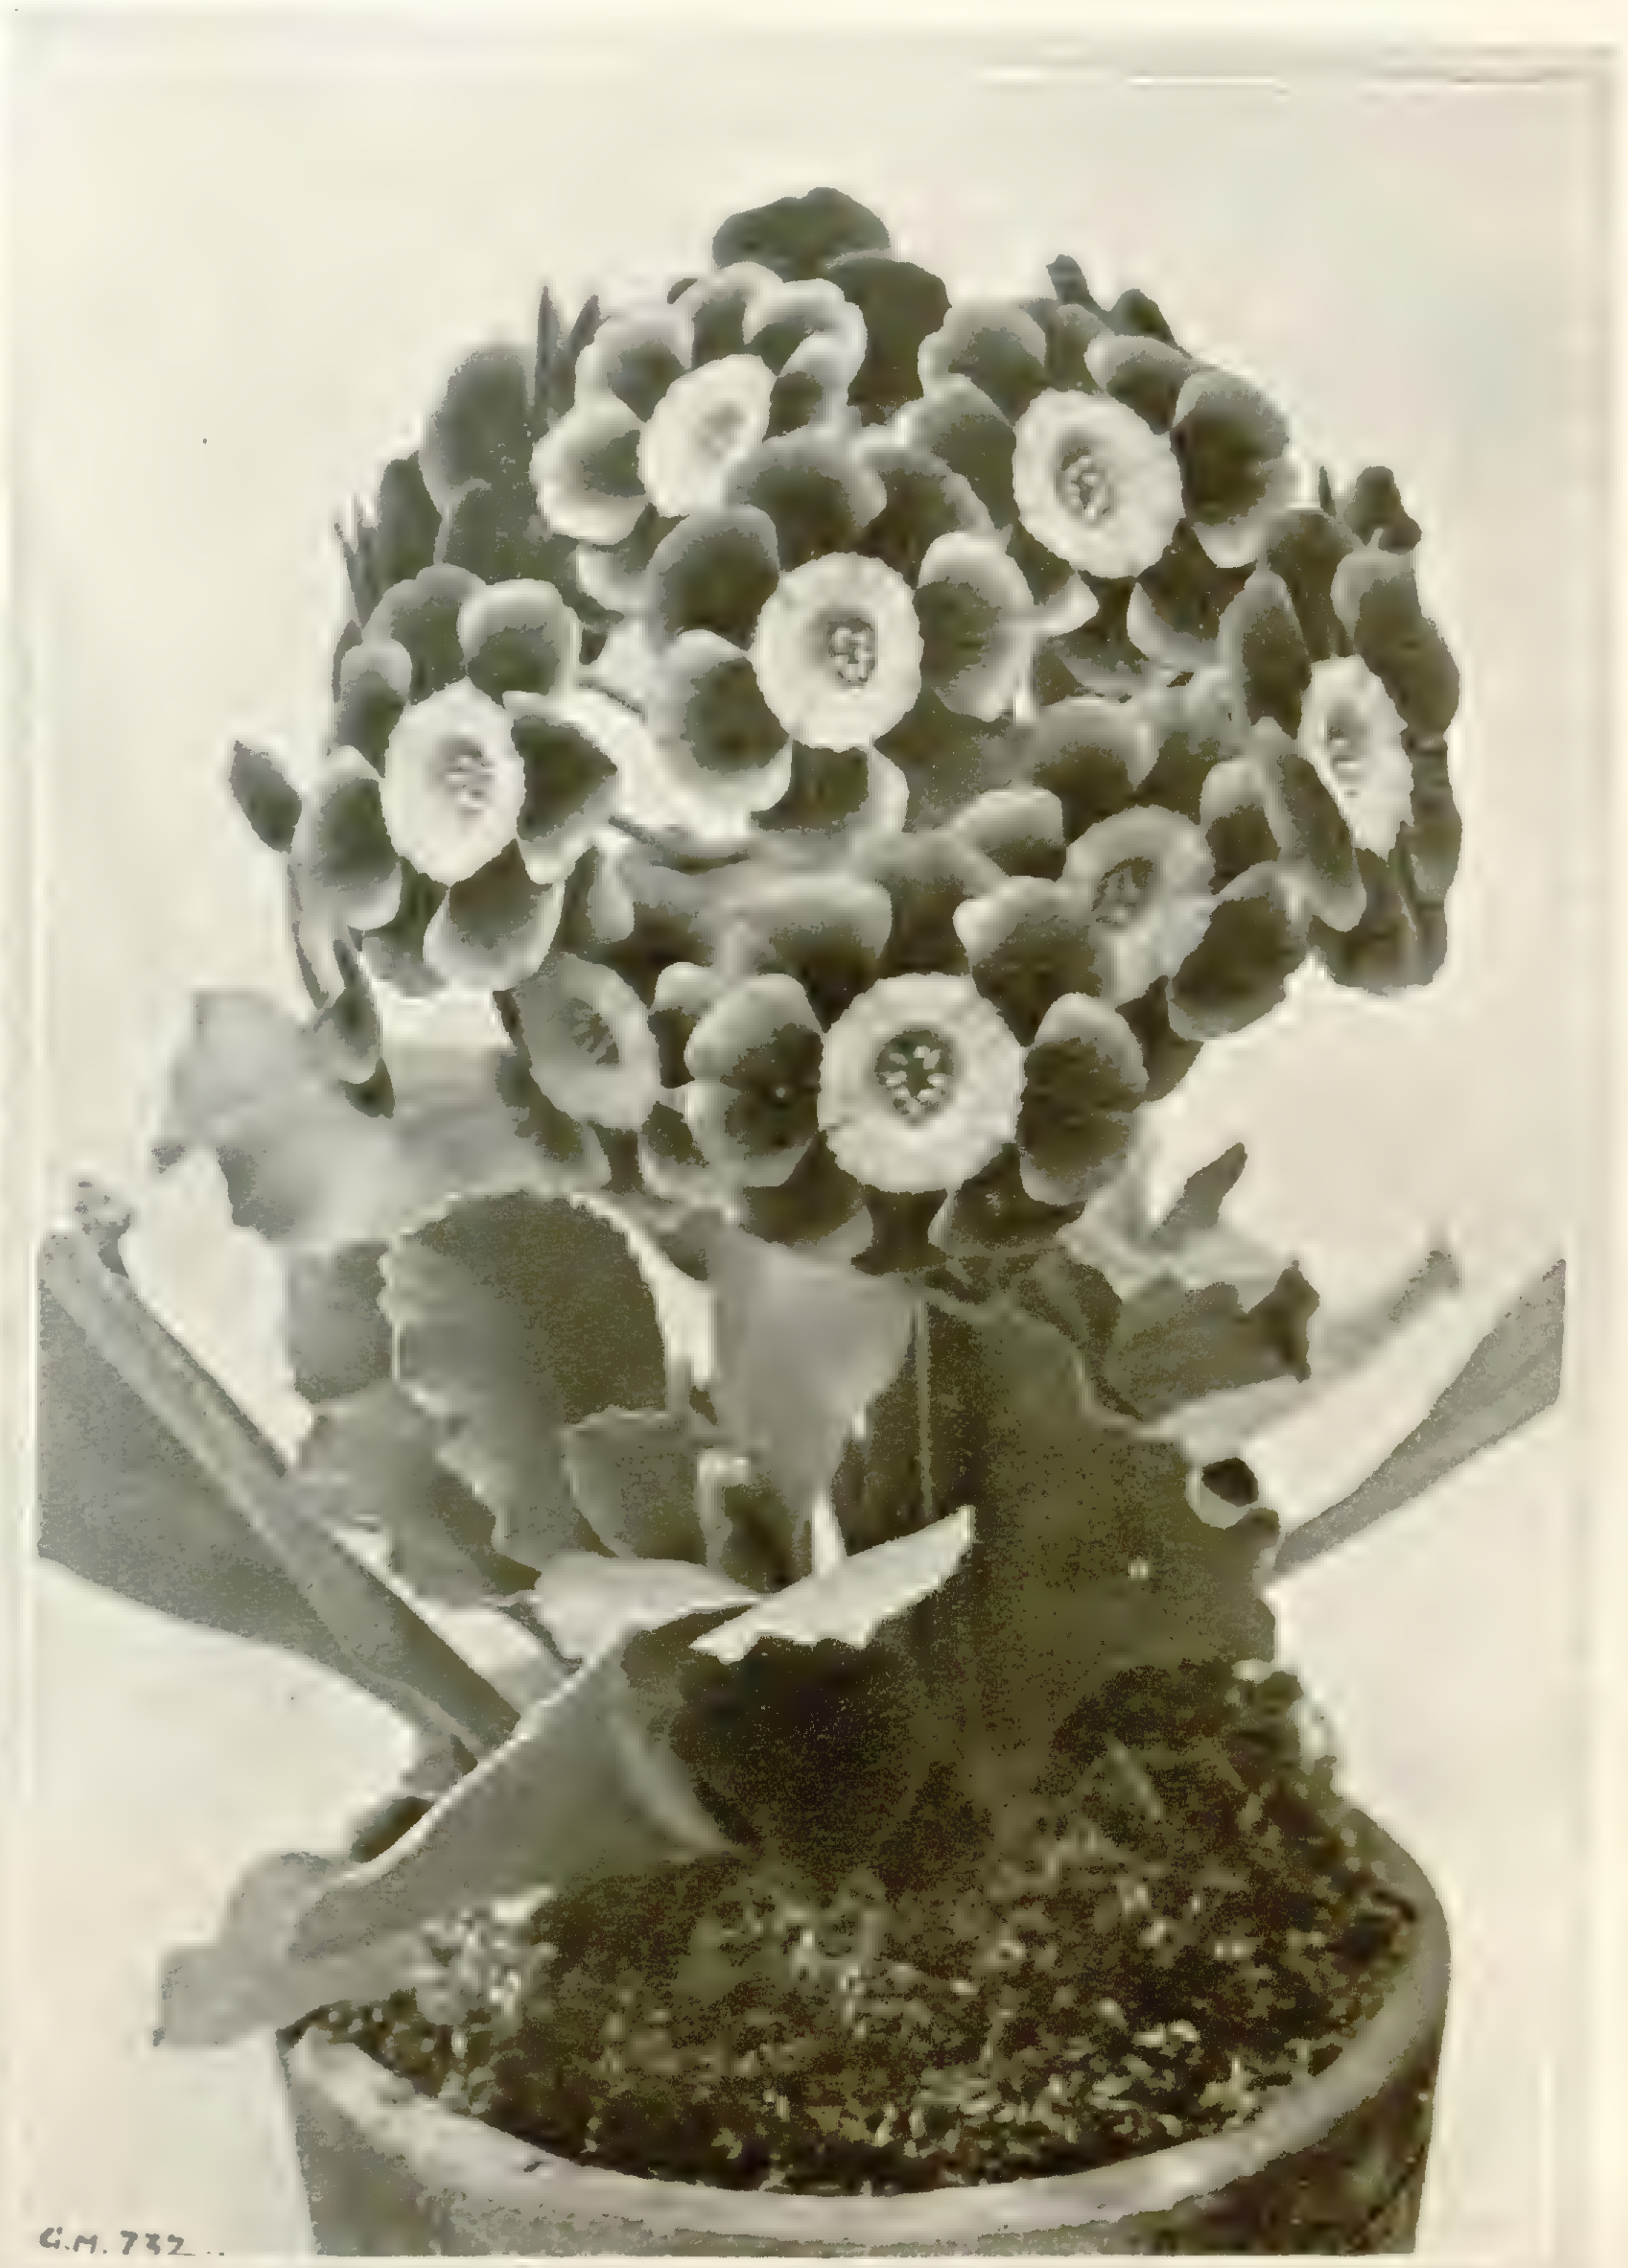
Plants, whether propagated in autumn or spring, should be well hardened off in order to ensure their success after being planted. How often do we see that starvation is substituted for hardening off. It is not a very uncommon thing to meet with calceolarias, pelargoniums, etc., in small pots, exposed to the full blaze of sun, and all the influence of cold, drying winds in April and May, with the view of making them hardy. Under such treatment the plants become stunted and wiry, and when planted out in such a condition they stand still a long time before they commence to grow freely. The tissues of the plants are so dried up and contracted that midsummer passes before they commence to make a really healthy growth. If, instead of exposing small pots to the full sun and wind for weeks, they are shaded during the hottest part of the day, or else turned out of their pots into beds of light, rich soil, they would present a very different appearance by the middle or end of May.

When the accommodation for plants is not far from the flower garden, I would suggest that those which have been potted off should, as soon as they have filled their pots with roots, be turned out of these, and planted in frames or temporary pits in soil composed of equal parts of loam and leaf-mould. There are great objections to matted balls in tiny pots, and when plants are in pots that are less than three inches wide, and the same in depth, the turning out system that has been recommended above obviates the evil arising from small pots, and, at the same time, saves trouble in watering, and produces far finer plants. Besides all this, it admits of the necessary amount of exposure for properly hardening off, without stunting and starving the plants. Even under more favourable circumstances they should not be exposed to cold, cutting winds, even though accompanied with bright sunshine, the effect of which is, as already referred to, to dry up and stunt their growth. It is much better during such weather to keep the lights on, merely giving air to prevent the opposite extreme.

A good plan in the case of those who have to turn out plants from under the protection of glass during the cold winds of spring, is to stretch some strong calico tightly about a foot above them, and let it remain so constantly. The plants obtain a fair share of light through such a covering, while they are protected from drying winds, and, if tightly stretched, the calico throws off rains also. Any additional night-covering required can be applied over it.

Throughout the month of April and in the early part of May bedding plants managed in this way usually make rapid progress, and an evil quite the opposite of stunting must be guarded against, namely, that of the stock becoming drawn and weakly. To prevent this freely expose during fine weather, and when the coverings are put on at night, do not forget to provide for the admission of a little air. The soil should be kept in a medium condition of moisture. Just enough water to keep the plants steadily growing and healthy should be given. The quick-growing things, such as calceolarias, etc., should be frequently looked after, and stopped, not allowing them first to make long, straggling growths, and then pinching severely back, but be regularly attended to, and have merely the points of the growth pinched off. Every sign of green-fly must be checked by fumigating, for if once this insect is allowed to overrun the plants they rarely ever thrive so well afterwards. When it becomes necessary to move bedders from the protection of glass, etc., to temporary places, where all the protection they can receive is that of being covered with mats or canvas, they should be well established and hardened off previously. The position chosen for such temporary protection should not be shaded, although well sheltered. If placed in a position where they get no sun for weeks before being planted out, they become tender and weakly, and when ultimately planted out in the full sun, the foliage invariably becomes scorched, and they lose their leaves and are sadly checked. This is more especially applicable to pelargoniums of the variegated class, but to all it is very injurious. T. B. FIELD.

Ashwellthorpe, Norwich.



NEW ALPINE AURICULA, CLAUD HALCRO.
Raised by Mr. J. Douglas, and received an Award of Merit at R.H.S. Meeting, April 20. Flowers rich crimson, shading to old gold. (See New Plants.)

Tydæas.—Though the quaintly marked flowers of these pretty gesnerads may be had throughout the greater part of the year, at no time are they more appreciated than when most summer flowers are on the wane. A varied selection may be obtained from seed, and, on the other hand, there are some very striking named varieties.—K.

EARLY LETTUCES.

The most important of all the salad plants grown in English gardens are the lettuces. It is not only in this country that the best seed houses have turned their attention to highly selected types, but in the United States and on the Continent much time and trouble is yearly spent upon the lettuce crops. It is quite bewildering to study some of the French catalogues, so lengthy are the descriptions of the numerous varieties of lettuces.

Some three years ago I grew upwards of sixty stocks of the Cabbage and Cos varieties; all were sown upon the same day, and a very instructive trial it gave, because it showed very plainly that there are varieties suited for producing crops in their own respective seasons, which, out of that season, are out of character and of no commercial value.

My object now is to say a few words about lettuces for late autumn, winter, and spring use, and I will give those I have found suitable for the purpose in a foggy town atmosphere, and these I am sure may be seen to greater perfection in a country district, providing the accommodation is there for growing them. Earliest of All, Commodore Nutt, Improved Tom Thumb, Early French Frame, Golden Ball, and Golden Queen, were amongst the best cabbage forms; and Dwarf Perfection, Little Gem, Verte Maraichére, Grise Maraichére, and Blonde Maraichére are very good Cos forms. The three latter may be described as taller Perfection, White Heart, and Peerless Cos varieties.

All the cabbage varieties named are early ones, but it has been found in at least one case that those that are naturally the earliest under open-air treatment are not so when sown in the autumn and subjected to frame cultivation. Late September and October sowings have proved that highly-selected stocks of Commodore Nutt and Tom Thumb heart more quickly than Earliest of All, which matures so quickly when sown in the open garden. In my own particular case, I still find Golden Ball hard to beat, and, grown in a large house, heated frames, or manure frames, I still get the best commercial returns from it.

I have found that for a winter-growing crop the frames heated by hot-water pipes have given the most satisfactory returns, as damp is more easily expelled, and mildew is less troublesome. For producing plants to transplant into newly-prepared frames, the bell-glass produces the most satisfactory results, and it is wise to make frequent sowings from the end of September up to November. These autumn sowings require no special treatment, in fact, the hardier they are kept at this stage the better. After Christmas, when gentle hotbeds are formed, with a few inches of rich mould placed upon them, and lettuces are transplanted from the bell-glasses, growth is soon active, and the produce matures with amazing rapidity.

A WELL-FURNISHED BED OF HYACINTHS, HYDE PARK.
The variety is the single light-blue Priestley.

There are a few simple but important points in the management of lettuces for winter and early spring use. Firstly, when the seedlings are large enough, transplant them thinly under other bell-glasses. Secondly, the soil in the frames must be within a few inches of the glass. Thirdly, when transplanting take care not to plant deeply, merely covering the roots is all that is required, for if the plants are sunk into the soil close to the leaf base, many of them will damp off. Our best results during the winter months, as before stated, have been from frames heated by hot water, and some of these are now (mid-April) producing their third crop, but this is only accomplished by having successive batches ready for following on as soon as others are cleared. The last batch is now, in fact, carrying two crops, cabbage and cos varieties together. The latter type is unresponsive for very early use, but, with brighter days during March, they move rapidly. All my lettuces grown in heated frames have had no manure for bottom warmth; they are growing in rich material made by mixing one part of old hotbed manure with one part of ordinary garden soil, which is light and sandy.

Those lettuces growing under bell-glasses at this season will require a slight shading during the hottest part of the day, or the glasses may be lightly smeared with whiting and milk made into a thin wash. I have found the bell-glasses most serviceable during this backward season in forwarding other crops; in fact, the uses they may be put to are almost endless and are worth recording. CHARLES FOSTER.

FRUIT PROSPECTS.

The winter we have just passed through has been a long and cold one, and trees are slow to unfold their leaves and blossoms, but the lateness of the spring is not without its compensating reward, as the flowering period of our fruit trees, thus retarded, is less likely to be visited with biting winds and frost. As a result of the lateness of spring, we can count with more confidence on a good fruit crop than would otherwise be the case. This year, too, is remarkable for the amount of blossom on fruit trees and flowering trees and shrubs. Even Prunus Pissardi, which is usually grown for its foliage, is wreathed in masses of its pale pinkish-white blooms, and espalier and wall fruit trees are producing wreaths of their charming flowers.

This condition of things I have observed most marked in gardens where the soil in which the trees are growing has been liberally supplied with phosphates and lime, and the early pinching method of culture has been in practice. In one instance, the trees have shown a tendency to produce nothing but fruit buds. Of course, the growths cut hard back at the winter pruning will, a little later, push out shoots, and furnish the plants with the necessary leaves to manufacture food to meet the demands of the crop. In order to lessen the strain on plants in this floriferous condition, the flowers should be thinned, or, better still, the buds rubbed off before they have expanded. This will prevent a waste of the carbonaceous matter, which flowers have the power of throwing off. The flower buds to remove are the worst-placed ones and those likely to get the least of the sun. The older and more feeble trees will benefit most from this kind of treatment, as they are less able to bear the strain on their resources occasioned by the developing and supporting a superabundance of flowers and fruit. Besides conserving the plant's vigour for the purpose of maturing a marketable sample of fruit, it also assists the tree in resisting the inimical effects of cutting winds and frosts should they prevail at any time during the flowering period.

In the event of the genial weather we are now having being prolonged throughout the flowering season, very heavy crops may be looked for, and these, as well as the flower buds, will have to be thinned, if decent sized fruit is desired. When thinning fruit, we are apt to aim at accomplishing too much by saddling the trees with more work than they are equal to, and when it is late learn the fact. In this case a few applications of sulphate of ammonia, at the rate of 1½oz. to the square yard of ground in showery weather, will do much in the way of assisting the plants to complete their task.

It is only by adapting conditions to meet prevailing circumstances that we are able to accomplish much with our crops, and in connection with fruit growing, we have to reckon not only with the trees, but with the soil and climate, and seasons as well; therefore, we have to look ahead, make our deductions early, and be ever watchful, and ever ready to supply the fostering aid to attain our aims. PEDESTRIAN.

Pentstemon Newbury Gem.—Mr. T. Smith (on p. 260) draws attention to Newbury Gem as one of the lesser known pentstemons. By some it is thought to be new, or comparatively so, but such is not the case, as when calling on Mr. Shingler, at Melton Constable, in Norfolk, nine years ago, he was using it largely as a bedding plant, and said he had known it intimately for forty years. In any case, it is a desirable plant, flowering profusely and continuously over a lengthy season. It is of easy propagation, and, what is important, is quite hardy, even in such winters as that just past. I have had plants stand for five years without being once replanted, and annually give a full crop of flower.—E. M.

Cauliflowers.—Cauliflowers are less hardy than cabbage, and while both are indispensable in every well-ordered garden, the former is regarded the greater delicacy, while it also entails considerably more expense and attention in forwarding and maturing the crops. The earliest sowings made under glass will have now advanced to the stage for planting out; careful hardening off is imperative, otherwise a severe check may follow, and thereby cause the plants to produce heads prematurely. Rich soil worked to a substantial depth, and preferably on a warm border at the foot of a south wall, will largely accelerate the earliest crop in the open. Any light protection in the way of spruce tops or light hurdles laced with the same material will assist in forwarding the growth, both by conserving the sun's heat among the plants and in breaking up cold currents of air. Varieties that produce medium-sized heads are most reliable for early use, such as Snowball, First Crop, and Early Erfurt, to be followed by Early London, Dwarf Mammoth, and Eclipse, while an April sowing of Walcheren and Autumn Giant will continue the supply of this vegetable till the end of the year.—THOMAS SMITH.

BULBS IN THE LONDON PARKS.

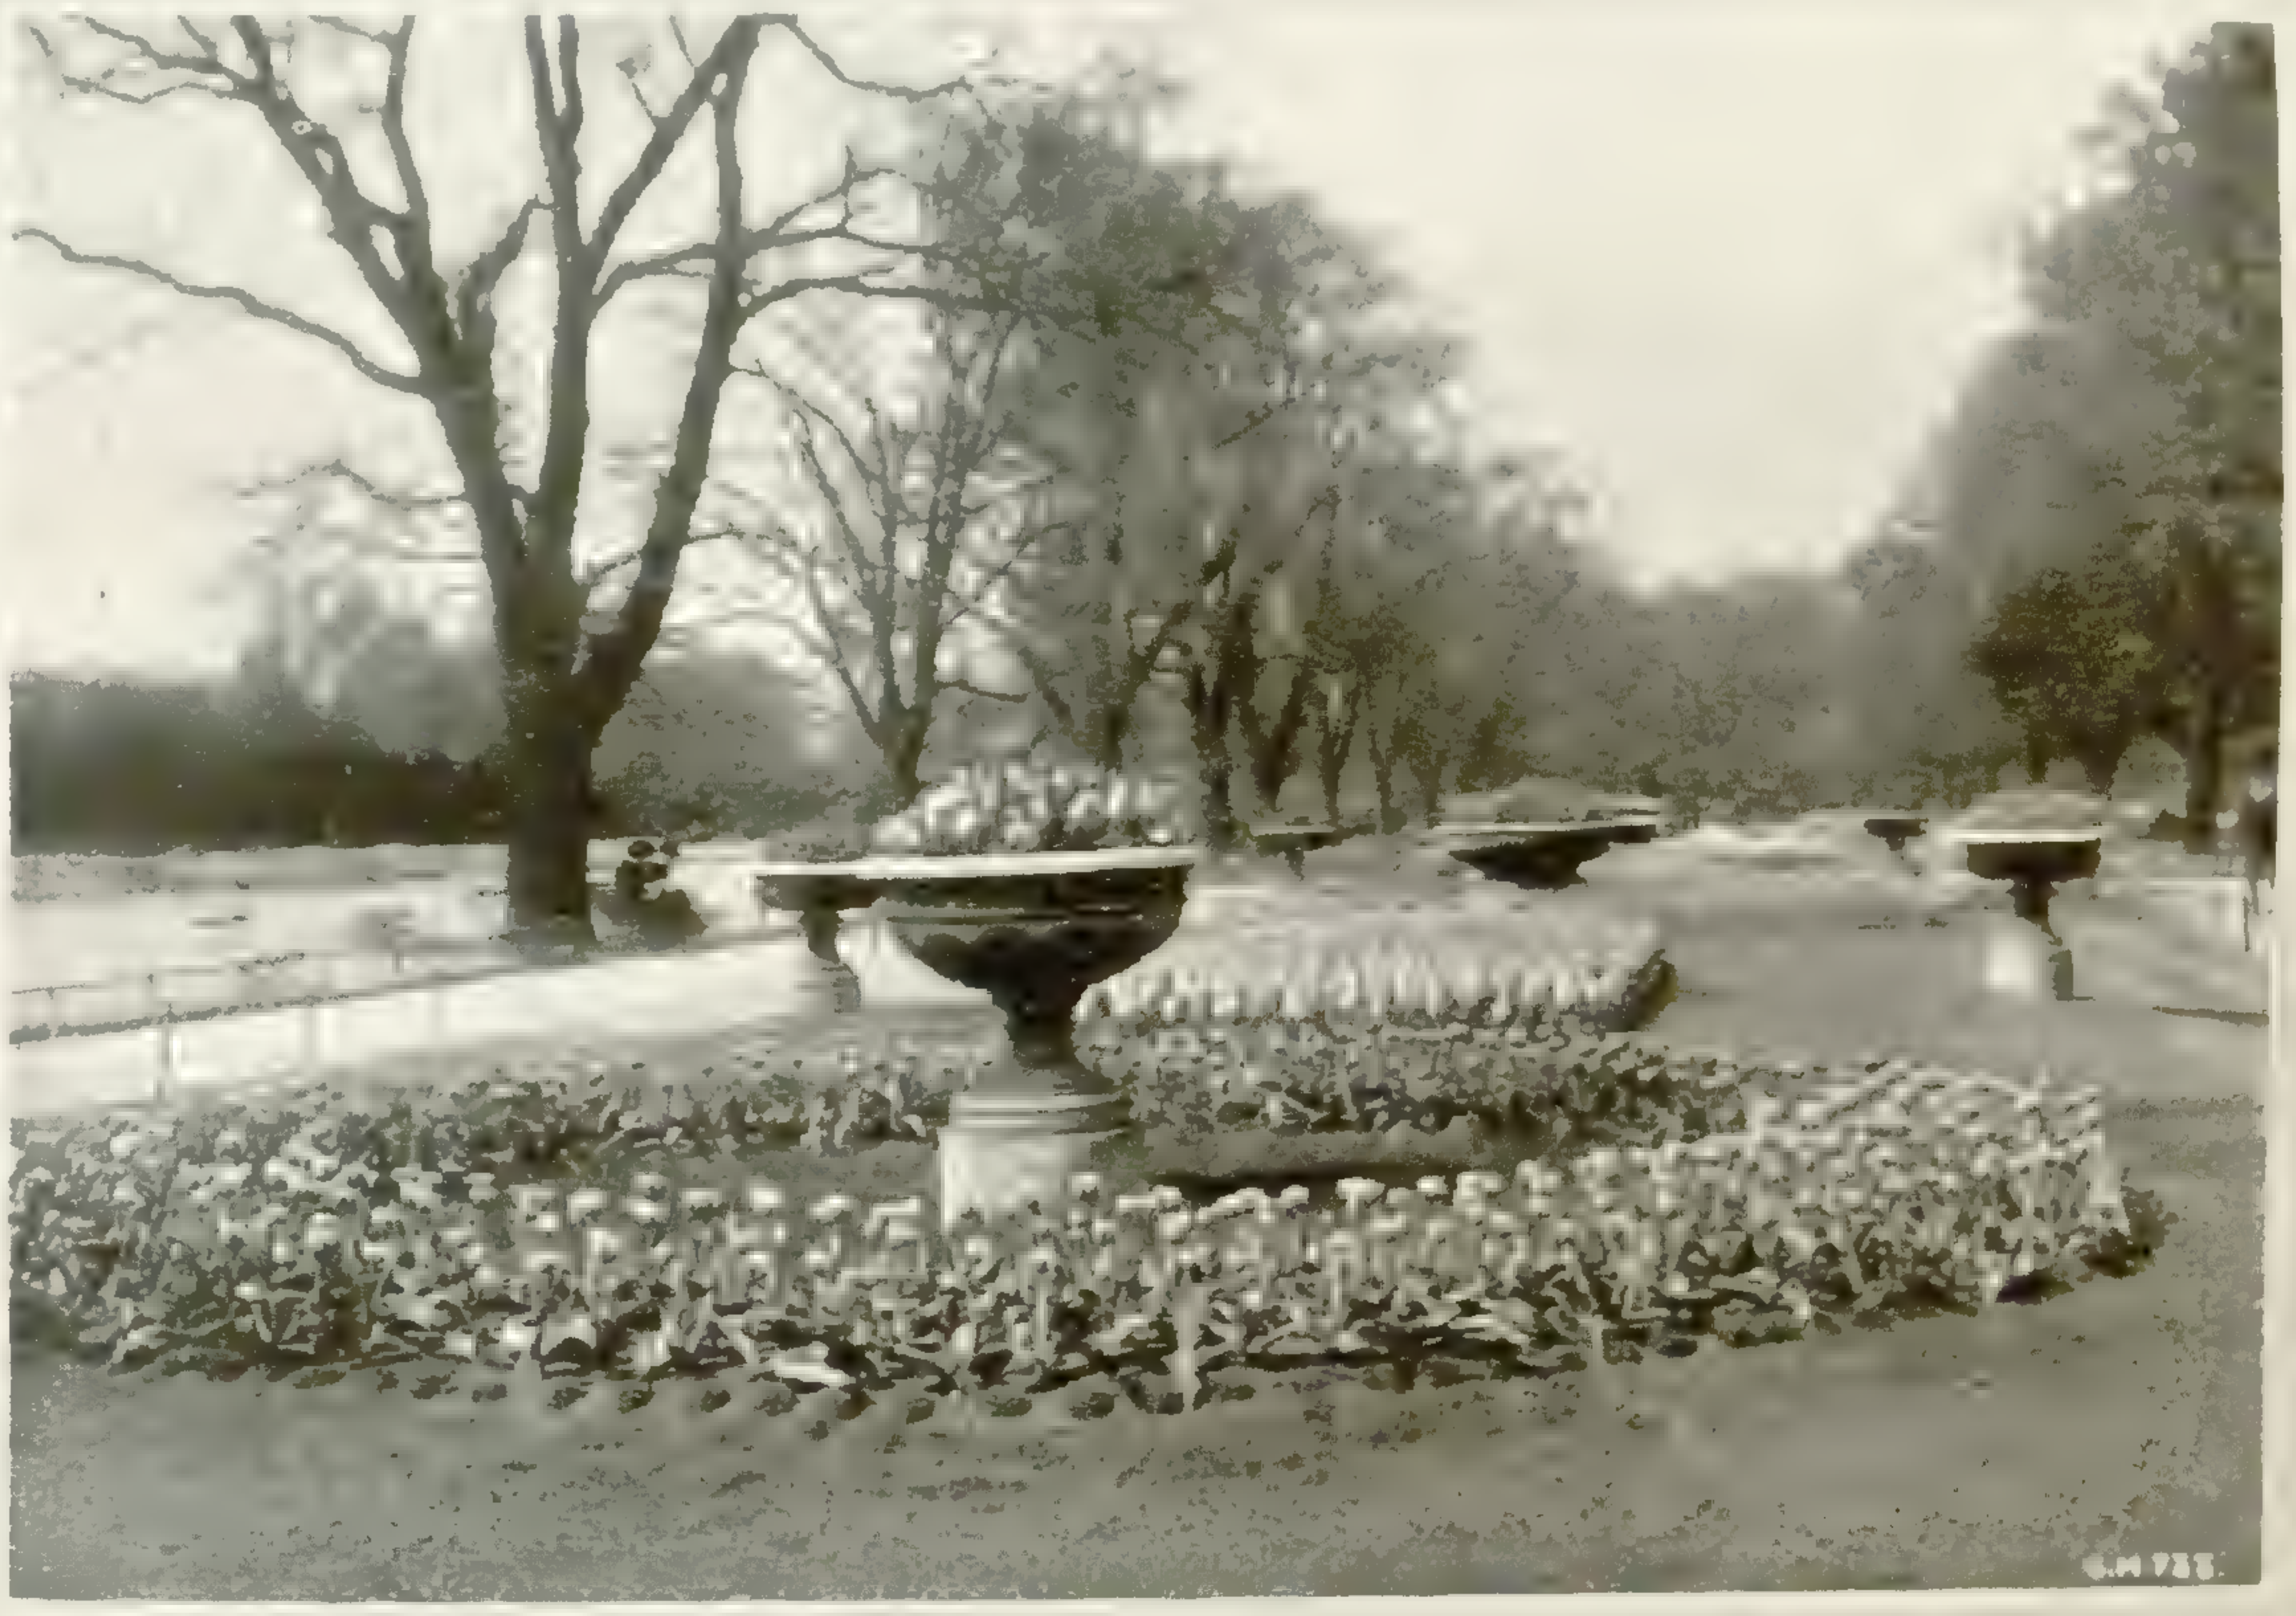
At the present time the Royal and other parks within the metropolitan boundaries are bright with the colour of the flowers of daffodils, hyacinths, tulips, and other subjects that yield of their charms in the season of spring, and the humblest of London's dwellers may enjoy displays of flowers equally remarkable for their magnitude and beauty. It matters not in which direction we may turn, there are flowers in plenty, and in association therewith evidence of an appreciation of their beauty. Those responsible for the management of the parks under the direction of the London County Council have not been wanting in zeal in providing displays of bulbous plants for the entertainment of visitors; and, whether we journey north to Finsbury Park, south to Dulwich Park, east to Victoria Park, or west to Battersea Park, we find that the endeavour of the respective superintendents to arrange the various bulbs in such manner as to give pleasure to visitors, and afford object lessons of much value to those engaged in horticultural pursuits, has been eminently successful.

The Royal parks are not less remarkable for their displays of bulbous flowers than are those under the management of the officials of the London County Council, and in no season have their traditions been more worthily maintained than in the one through which we are now passing. In the Hyde Park display Mr. Gardiner has fully maintained the high reputation he obtained as the result of the success he achieved at Hampton Court, and those who have annually to provide arrangements of spring-flowering bulbs, and are not far distant from London, should endeavour to visit the park. The principal effects are those produced in the enclosures alongside Park Lane, which forms the eastern boundary to this park. Here, as befits the surroundings, the arrangements are characterised by boldness, and from whatever point of view selected, the effect is rich and tasteful. The flowers chiefly used are daffodils, hyacinths, and tulips, and in some cases they are arranged separately, and in others two kinds have a place in the same bed. But in no cases do the beds contain mixtures of the ordinary type. In some cases the useful white bedding tulip is associated with the Empress daffodil. In other beds dark tulips may be seen in association with such strong yellow daffodils as Emperor and Glory of Leiden. Again, yellow and crimson wallflowers are associated with both daffodils and tulips, and as a harmony of colour is at all times obtained, these combinations are very pleasing.

Some of the fine beds of hyacinths consist wholly of one variety, and one of these is herewith illustrated for the purpose of showing the method of planting that is adopted in Hyde Park with so much success. In not a few cases hyacinths are planted so far apart as to show a considerable area of the surface of the beds when they are in bloom, and when this happens the colour effect is not altogether satisfactory. There is some excuse for thin planting, for, owing to the small space occupied by one plant, a large number of bulbs is required for a bed of any considerable size. The variety illustrated is one known as Priestley, a single pale blue variety producing large spikes of bloom. The beds of hyacinths in which several varieties have been planted are especially attractive, and in every instance a delightful harmony of colour has been produced. Especially noteworthy is the bed furnished with Alba superbissima, Gigantea, and Gertrude, in equal proportions, and even more so, perhaps, are the beds in which the light blue and salmon pink varieties are in association.

As for many years, the principal display of bulbous flowers in Regent's Park is in the flower garden in the southern half of the park, but there are bulbs elsewhere, and the glories of the spring are in the several enclosures contiguous to the chestnut avenue which forms so distinct a feature. A portion of the flower garden is herewith portrayed, and from the illustration it will be seen that there is a wealth of flowers of daffodils, hyacinths, and tulips. In the immediate foreground is a circular band of the attractively coloured Keizerskroon which, in its colour and period of flowering, has no superior. Beyond it is a fine mass of hyacinths, which may well be taken as a model for the planting of these bulbs; and still farther on are glorious masses of golden daffodils that strongly appeal to the artistic temperament as they dance in the sunlight. There are numerous beds outside the lines of chestnuts, and these, now gay with their rich colouring, contribute liberally to the general effect.

In the arrangement of the huge triangular bed on the west side of the avenue, Mr. A. D. Webster has surpassed himself, and produced one of the most beautiful arrangements of hyacinths that has yet been made in this country. The bed is of immense size, the three sides are arranged to form gracefully flowing curves, and the surface is broken up to form a series of mounds, the higher points being several feet above the general level. The outer mounds are planted with distinct colours, and between them are large blocks of hyacinths, selected, it need hardly be said, with due regard to harmony of colour. The higher areas in the middle of the bed are occupied by strong-growing golden daffodils, which are flowering, as in other parts of the park, in the most satisfactory manner.



AN EFFECTIVE DISPLAY OF SPRING-FLOWERING BULBS, REGENT'S PARK.

Although outside the London area, the Royal Gardens, Kew, should be visited by those specially interested in spring-flowering bulbs, because of the fine examples they afford of naturalising daffodils, bluebells, etc. The formal beds devoted to bulbs are also remarkably attractive, both in front of the Palm House and on either side of the Broad Walk. G.

Acidanthera bicolor.—This bulbous plant is, botanically speaking, not far removed from the gladiolus, and has long arching leaves, and a flower stem that reaches a height of two or three feet. The flowers, which are loosely disposed on the upper part, have a long slender tube, while the expanded blooms are about three inches across. They are creamy-white, with a patch of purple at the base of each segment, and have a pleasing fragrance. This acidanthera is a native of Abyssinia, and was given a First Class Certificate by the Royal Horticultural Society in the autumn of 1896. It is certainly a very pretty bulbous plant for the embellishment of the greenhouse in its season.—W. T.

SALVIAS FOR BEDDING.

The value of salvias for bedding purposes has been clearly demonstrated in the London parks and public gardens in recent years, and the plants should be coupled with early flowering chrysanthemums for filling the breach and replacing in late summer subjects that have become shabby or flowerless.

Far and away the most effective kind is Salvia splendens grandiflora, with most brilliant scarlet flowers, and one cannot find a more striking object in the garden when in full bloom. Cuttings should be struck in warmth during March, and grown in a greenhouse until the middle of May, when they should be planted out in a sunny spot in the reserve garden. If a fair quantity of cocoanut-fibre refuse is added to the soil, and within six inches of the surface, it will be possible to lift them with a large ball of soil attached, and they will receive no check whatever on removal. It will, of course, occur to the cultivator that spraying overhead in the evenings for a week or ten days will assist their re-establishment.

The type plant, S. splendens hastens into flower at a much earlier date than the foregoing, or at any rate that is my experience, and in order that they may flower simultaneously, it is persistently pinched during the summer. A peculiarity which has been observed in this plant is that if the flower buds are allowed to remain they fail to expand during the hottest months in town gardens, while it behaves in normal fashion with the approach of autumn.

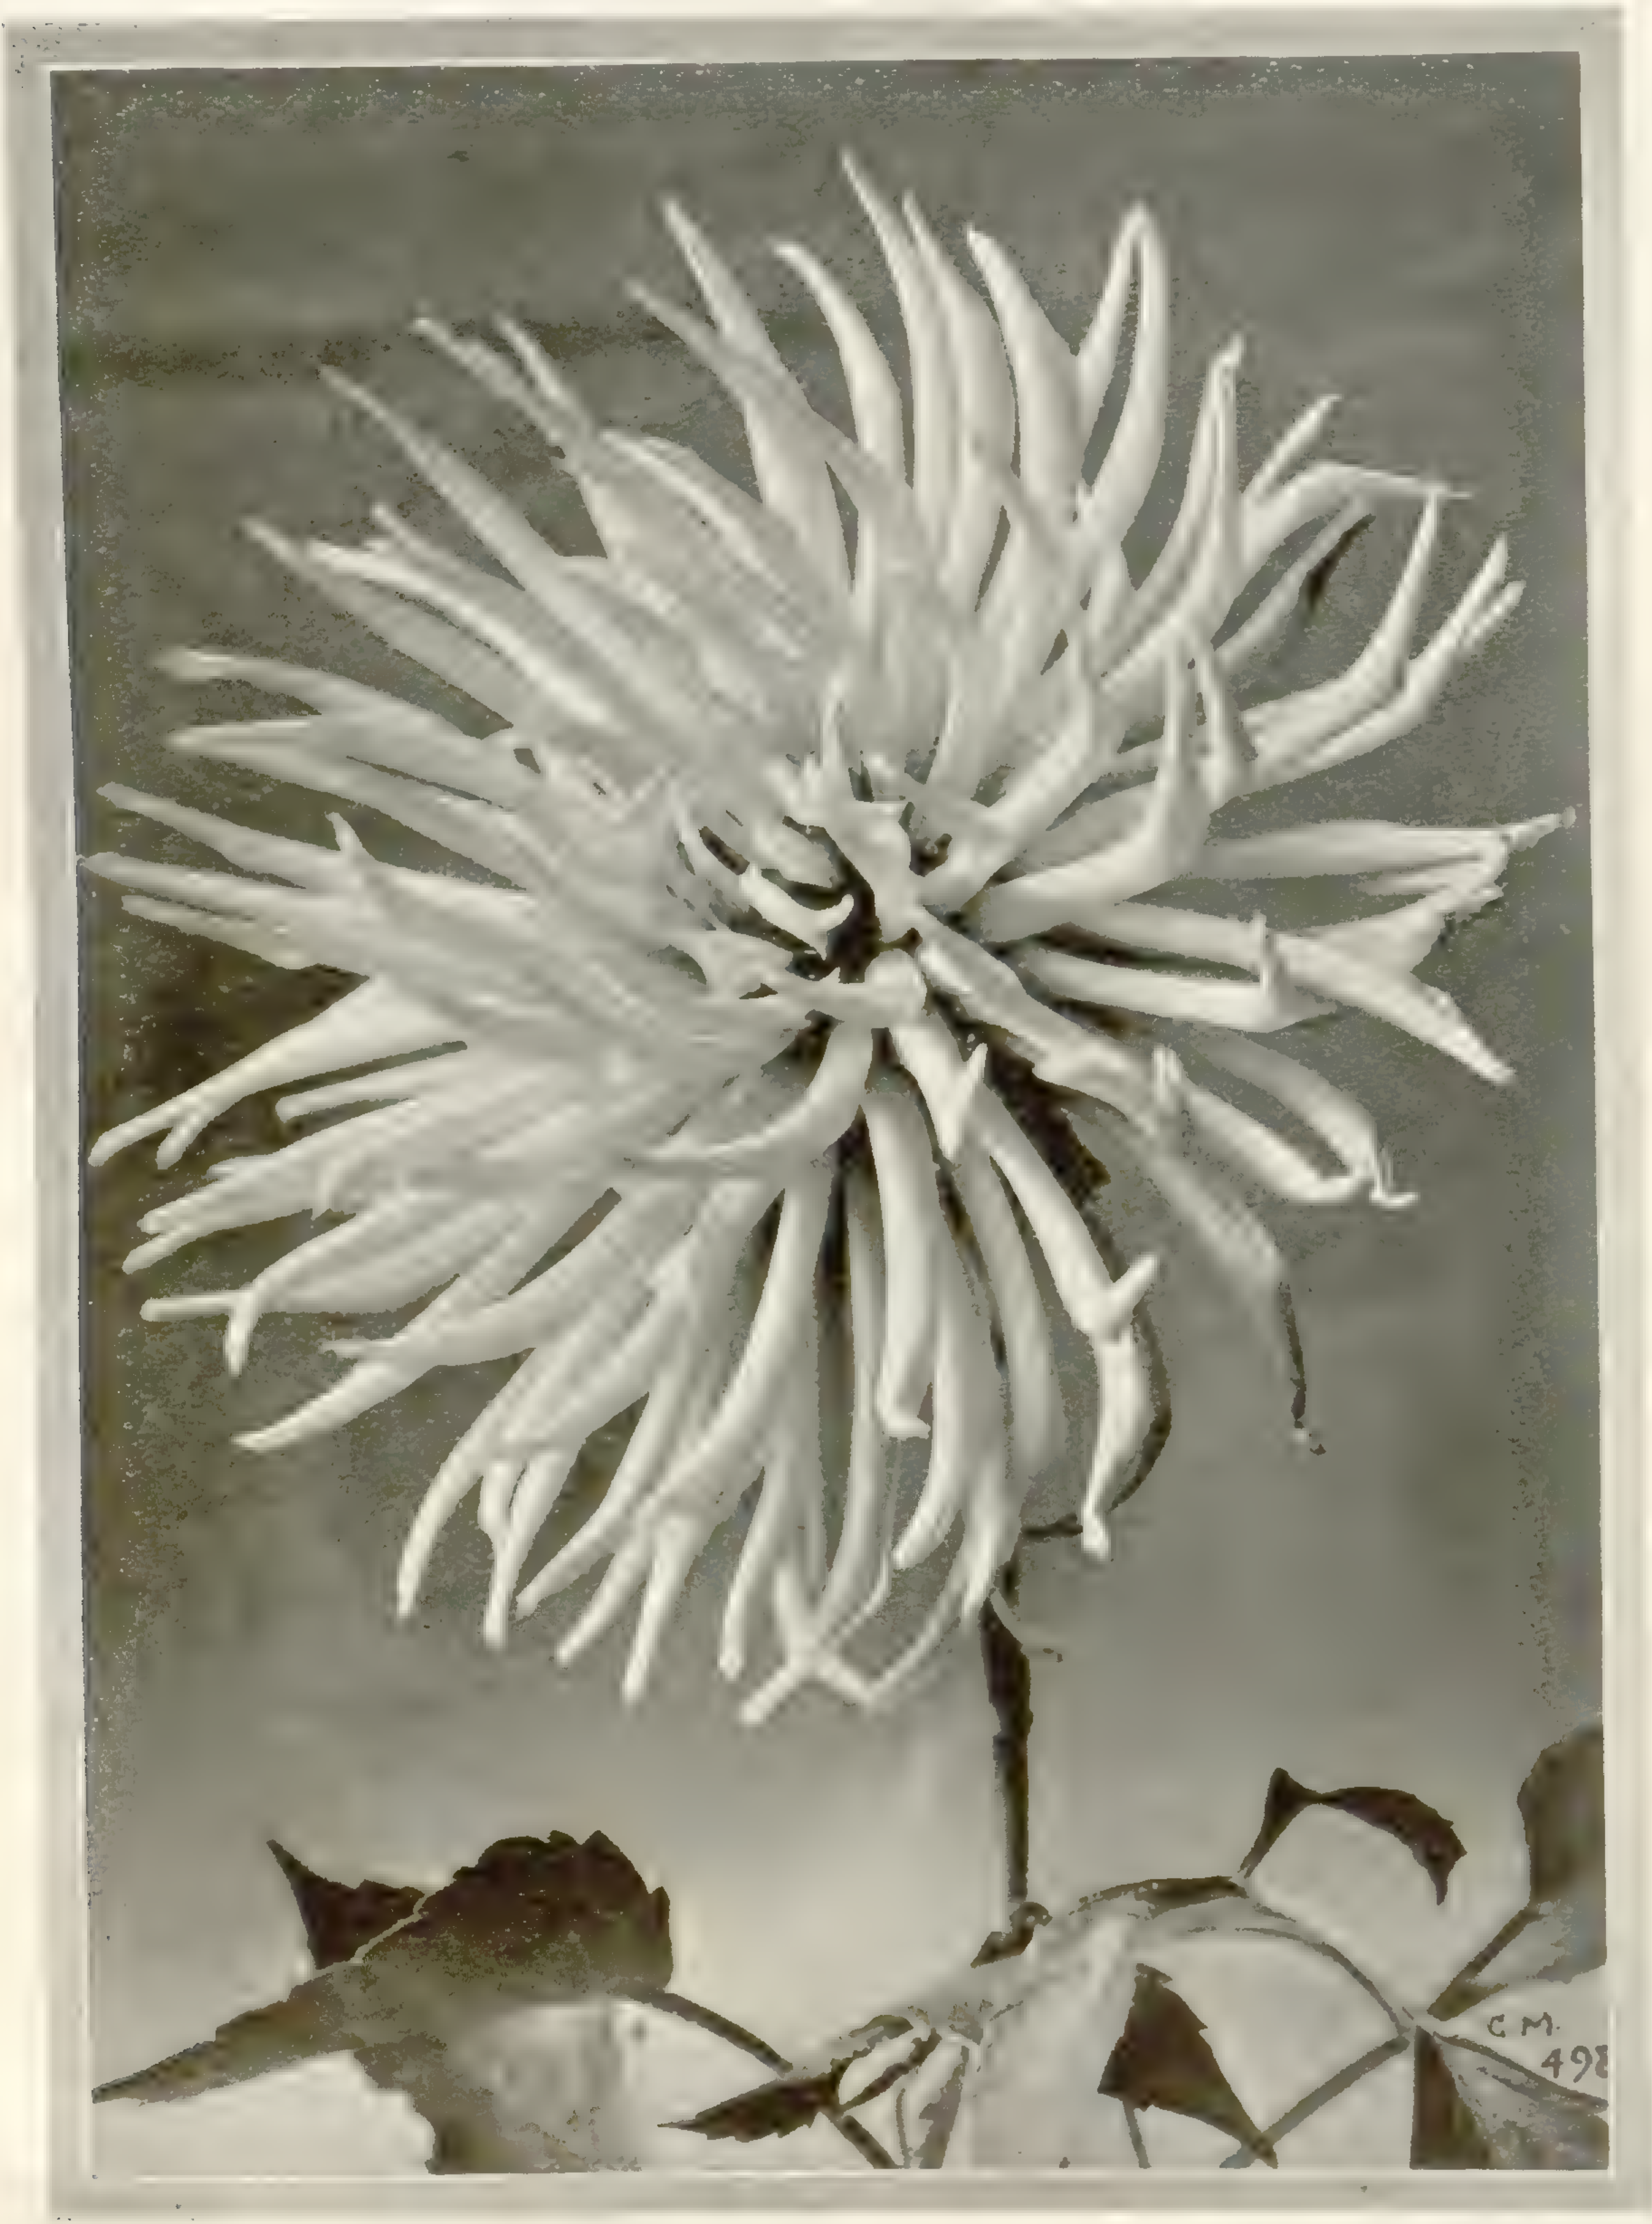
A very fine species is seen in S. Pitcheri, of a very beautiful blue shade. It should be grown in pots, and if placed in a very warm and sunny position a brave show is made by the middle of September. It associates harmoniously with early-flowering chrysanthemums. As seen in very large pots or tubs, towering up to six feet in height, it forms a splendid addition to early autumn and winter-flowering plants in the greenhouse.

Less showy, but worthy of mention and culture, is S. Bethelli with amaranth colouring; it requires the same treatment as the foregoing. The old Salvia patens should be represented in the bedding arrangements and may well rub shoulders with the deep golden Calceolaria Burbidgei and specimen ivy-leaved pelargoniums.

Walter H. Aggett.

NEW CACTUS DAHLIAS.

We are informed officially in the report of the National Dahlia Society that last year was favourable to the successful cultivation of the dahlia. I take it that means so far as the weather was concerned. I fear, however, had a census of opinion been taken from a number of growers, the majority would have reported unfavourably. I certainly have not forgotten the "overcoat" June, the hard, unkind July, and the cold nights of August, while the fourteenth of September saw the majority of my plants hopelessly destroyed by frost. I merely mention these facts to explain the paucity of the 1907 varieties at our leading dahlia exhibitions, for very few of the most promising novelties of the year were staged in good condition, and I fear it is just as likely that the best varieties of last year's introduction will not be seen prominently at our next autumn shows.



NEW CACTUS DAHLIA SNOWDON.
Raised by Messrs. J. Stredwick and Sons. Pure white.

The raiser is generally blamed for this state of affairs, but it is hardly fair that he should bear the whole of the blame; no doubt he propagates as closely as possible, for it is the only way for him to reap a reward, but I fear the buyers of novelties are far more to blame, for as soon as the new plants arrive, in common parlance, "off comes his head," to increase commercially the flowers of the earth.

What is the result? Simply that the plant we have mauled has to be hurried up to make a decent and respectable article at planting time. This operation naturally causes the plant to produce its flowers later in the season; therefore, few of the novelties are seen at the exhibitions the following year, and many of the novelties distributed get a bad name before they have time to exhibit their true form. Consequently, many really good sorts pass into oblivion in an undeserved way.

The novelties of this season cannot be described as a great advance on those produced during the past four or five years, but we must bear in mind that the advance of this section of the dahlia must now be necessarily slow, and, perhaps, in a season or two, it will follow on somewhat different lines. Beyond a doubt, we must have a better habit instilled into the plants, if they are to maintain their popularity in the eyes of the general public; and probably now that the National Dahlia Society has instituted trials, we shall have an opportunity of judging in a better way than formerly the merits of novelties. Now, we have to rely solely on the flowers we see staged. I trust also that the leading society will deal with the duplication of names which causes so much confusion at the present time, an evil that would not be allowed to exist either in the National Sweet Pea Society or the National Chrysanthemum Society. As an illustration the name Dorothy appears to have a particular fascination, for we have the name in the single section, again in the fancy show varieties, and still again in the cactus sorts. How many more Dorothies are we to be blessed or bothered with. The repetition, perhaps, is still more striking in the new garden cactus variety Brightness (Baxter), for we have already a garden cactus of this name, and of the same colouring too. Again, we have Vivid (Ware), a new one, and we have also Vivid of similar colouring in the same section already in commerce. Surely it is time the National Society took this matter in hand.

During the past year eleven novelties received first-class certificates from the National Dahlia Society, quite a small proportion of the new sorts staged, and I might add in passing, that it is now difficult to obtain the coveted award. It must be something really distinct in colouring or form to even arrest the attention of the committee. Now the whole of those so honoured last year are worthy of taking a place in the first rank, but I do not intend dealing with the whole of them, but just mentioning those that I consider the most striking.

Una (Burrell and Co.)—This is, no doubt, the most distinct "break" of the year. Delicate silvery rose, shading to white at the base, the florets are divided deeply, in fact, almost fimbriated; the general appearance of the flower resembles a head of well-curled endive.

Monarch (Burrell) will certainly make its name on the exhibition table, it is bright bronzy red, with a yellow centre, the florets are long and narrow, the whole being well built. I am informed it also possesses a fine erect habit.

Rev. T. W. Jamieson (Stredwick).—This I consider one of the best of the new introductions; in colouring it is best briefly described as yellow, deeply edged with lilac-rose. It is a flower of grand build, with a perfect centre, and as the illustration depicts, the florets are beautifully fluted.

Saxonia (Stredwick).—A colour much wanted by exhibitors, rich purple-red shaded, it is most striking, while the flowers are large, refined, and carry a high centre

Glory of Wilts (Keynes).—The deepest yellow or golden variety yet seen in this section, the flowers are large, and the form most refined.

Snowdon (Stredwick).—One would think it difficult to produce a new white variety, and doubtless the general public would describe most of them, as distinctions without a difference, but to the trained eye, the distinction can be seen at a glance, and in this one (see illustration) we have a quite distinct variety, inasmuch that it is pure white, of excellent form, and, what is better still, it has good stiff stems.

Nellie Riding (J. T. West).—This is the best of the bicolors to date; deep crimson with heavy white tips, the flowers are large and well built, will make a fine exhibition flower. It was illustrated in these pages last autumn.

Fairy Queen (H. Shoesmith).—This is best described as an improvement on Fairy, it having the same delicate florets and refined appearance, while the blooms are much larger than the older form.

Satisfaction (Stredwick). — A pleasing

shade of rose, with the centre of the flower creamy-white. The build of the flower leaves little to be desired, the florets are long, and gracefully fluted.

Wellington (Stredwick).—A bright scarlet shaded purple towards the tips, a very large flower, with a good high centre.

Royal Scarlet (West).—A really grand scarlet flower, pure in colour, the florets are long and narrow, it should make a telling bunch on any exhibition stand.

J. B. Riding.

VALUE OF GLASS PROTECTION.

I was extremely interested in the leading article on the above subject in the Gardeners' Magazine of April 10. The value of portable frames in every kind of garden can hardly be overestimated, and I have for many years proved their usefulness and advocated their increase. At the present moment, when we hear so much about French gardening, the valuable editorial remarks are to the point, and well-timed.

I am one of those who do not agree at all with the so-called French system of gardening, knowing as I do, that in the great majority of cases, especially in private gardens, it is not so much a question of being taught how to produce early and first-class vegetables, as it is of providing the means to produce them. I am fully convinced that, if better means were generally provided, we could well hold our own. Cheaply made wooden frames, in my opinion, provide by far the best and most economical method of bringing forward early vegetables under glass, and, with the aid of a small quantity of fermenting material, chiefly consisting of leaves (which are far too often wasted), the great majority of early vegetables can be brought forward far in advance of anything we may produce in the open, at a very small cost, and good prices may be readily obtained.

The great value and convenience of such frames are, that by judicious management, they may be brought into use, for one thing and another, the whole year through. The great point is that all the frames should be made of uniform size, so that the light can be readily removed from one frame to another as required, and it is also a capital plan to have at one's disposal double the quantity of frames as lights, as it frequently happens that the frame may be left with some great advantage minus the lights for some time, while the lights may be doing duty in bringing forward successional crops.

Such frames, too, as already pointed out, are useful for other branches of gardening, and it cannot be too deeply impressed upon the minds of all who are anxious to obtain the best results from their gardens, that an ample supply of frames should be provided.

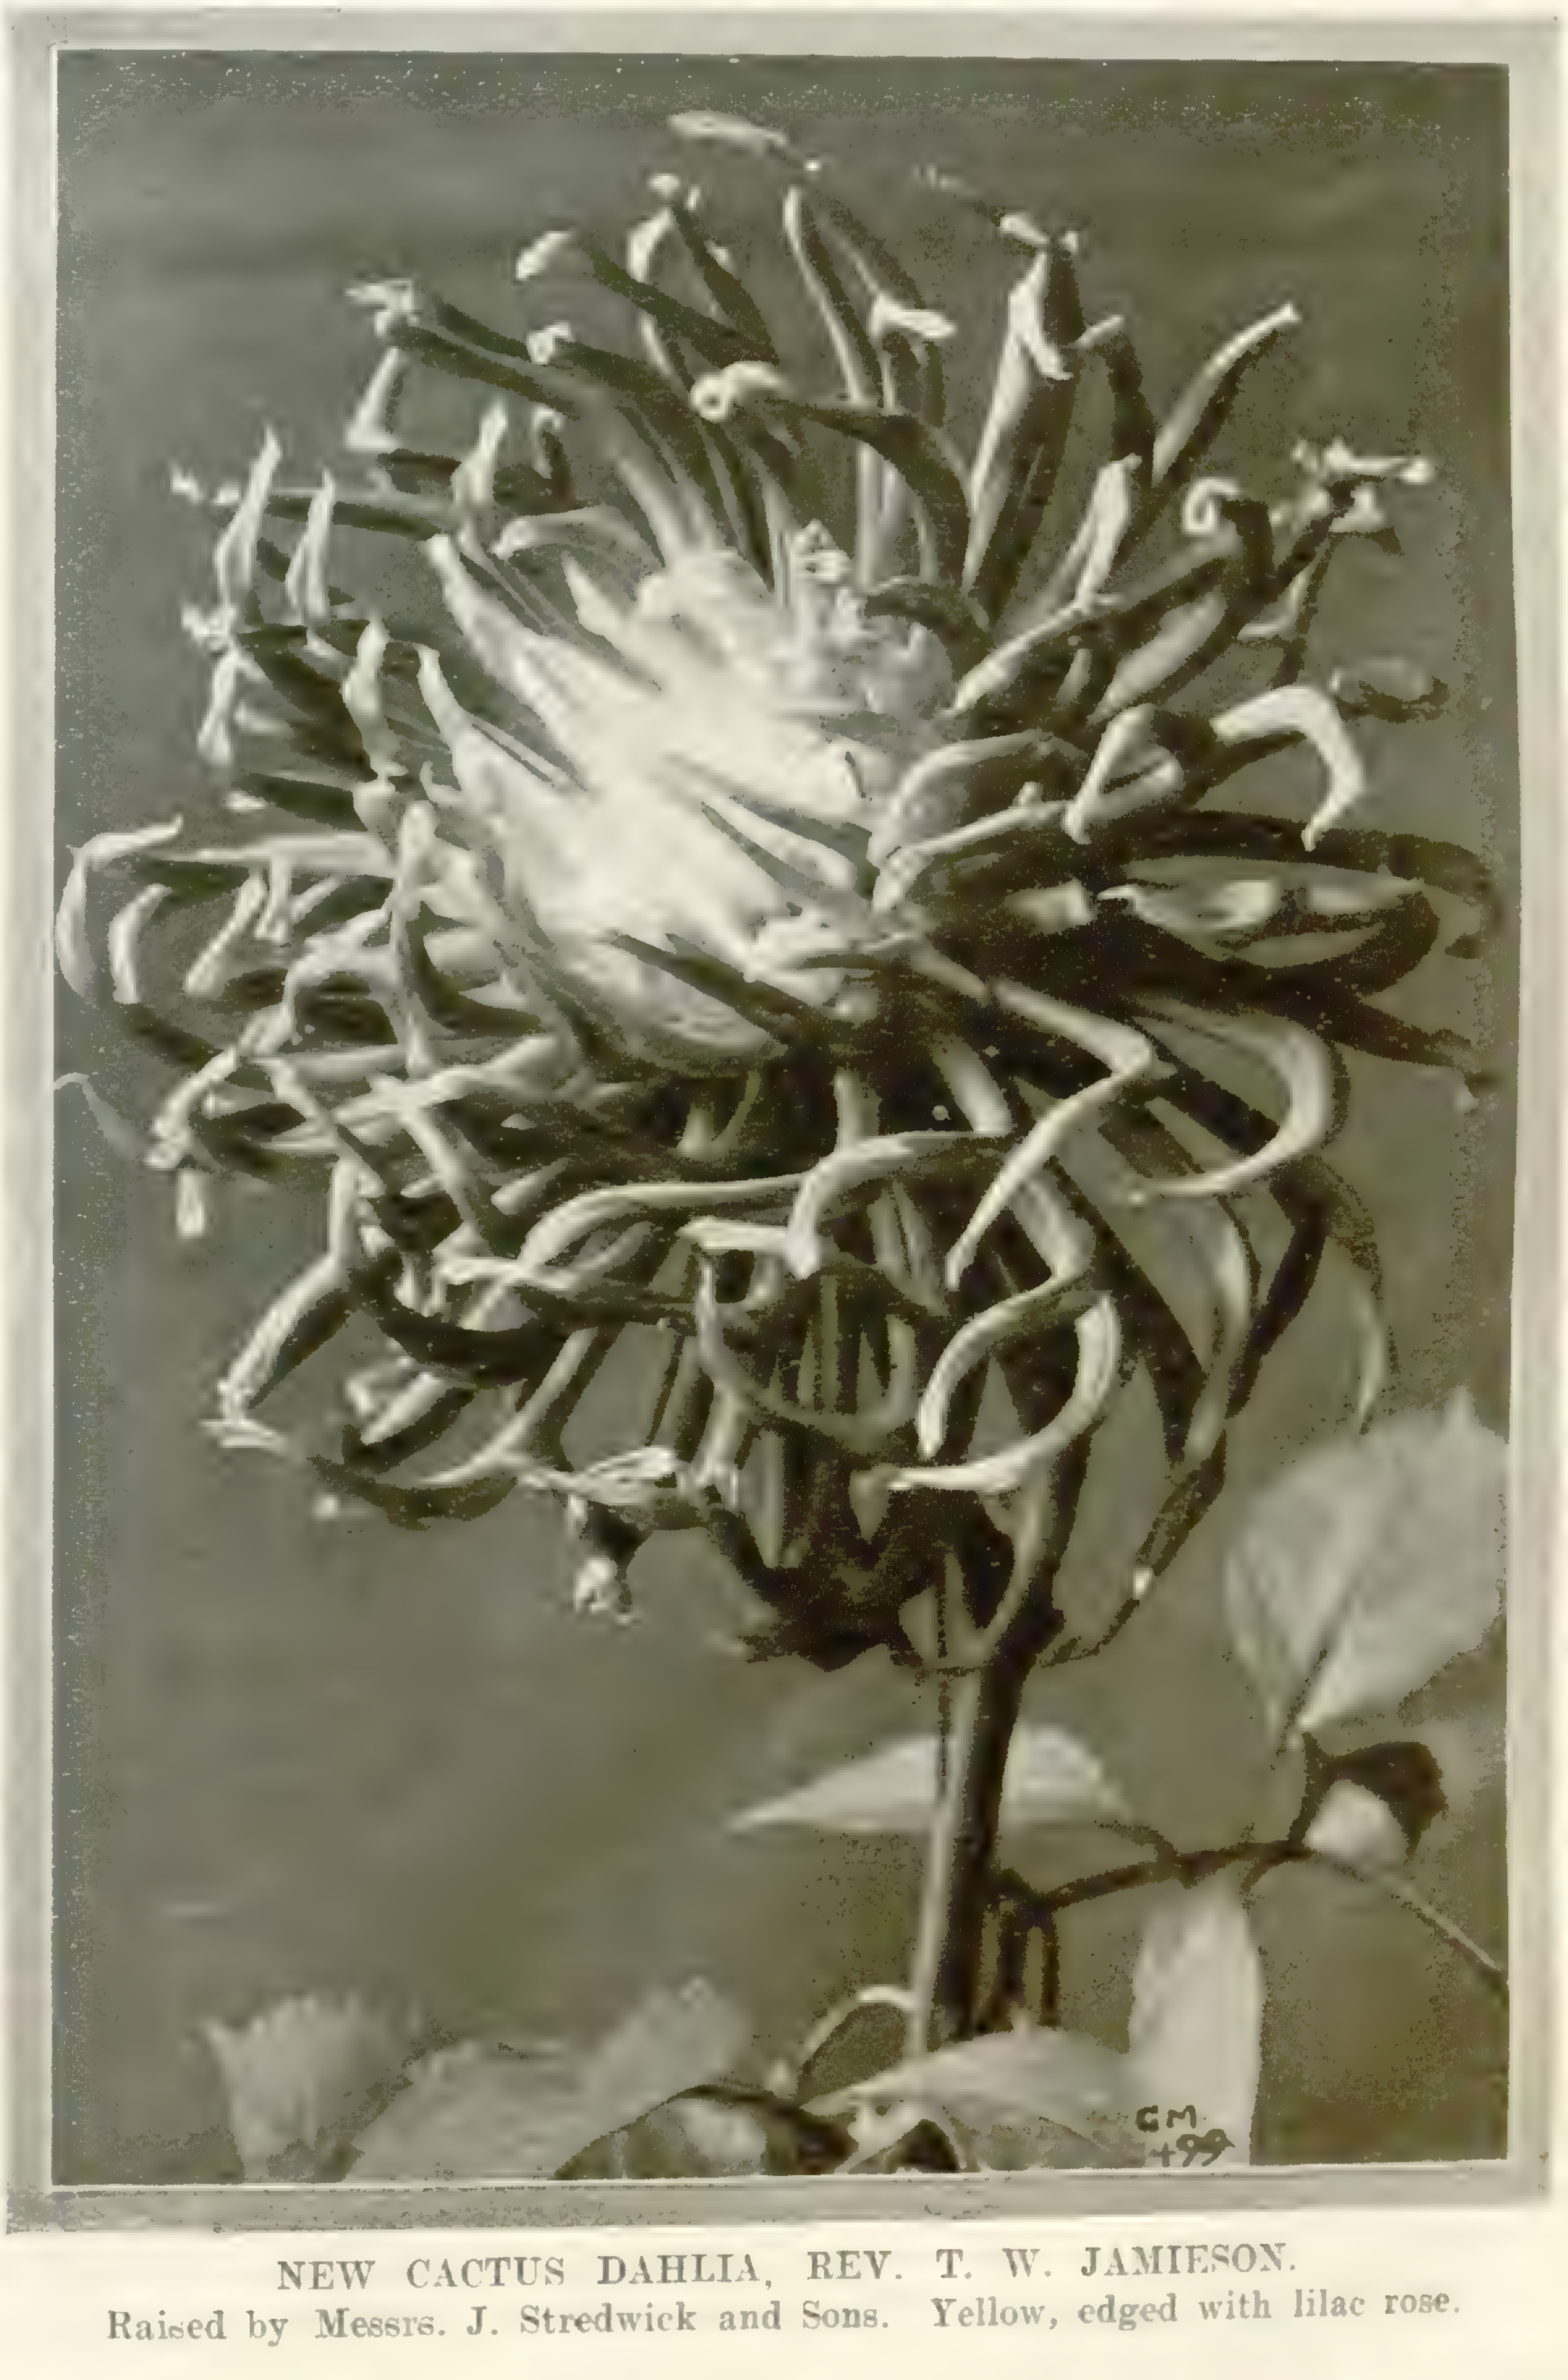
For the amateur proper, and for the cottager alike, frames are invaluable, and it is really surprising what aid these afford to the enthusiastic cottager, first of all in raising the various kinds of seedlings both for his flower and vegetable garden, and afterwards in doing duty for growing cucumbers all through the summer months. And again, when autumn approaches, these frames are carefully filled with late autumn-sown plants, and such like. I have also on several occasions seen some remarkable crops of tomatoes grown in a fairly large three-light frame, by elevating it, putting out good strong plants early in May, and training the growths up, on rods of course, putting out the plants at the bottom of the frame.

E. Beckett.

Aldenham Gardens.

SOME DARK ROSES.

There is a peculiar charm about the high-coloured rose, especially the very dark velvety maroon shades. The softer colours predominate, and we have few really good darks. I do not allude to deep reds, such as Doctor Andre and General Jacqueminot, but propose to note some of the deeper shades. Probably 95 per cent. of the newer introductions belong to yellows, reds, pinks, salmon, and coppery shades; but with all their beauties they lack the peculiar charm of dark velvety maroon, also the exquisite perfume belonging to these I will try to describe.



NEW CACTUS DAHLIA, REV. T. W. JAMIESON.

Raised by Messrs. J. Stredwick and Sons. Yellow, edged with lilac rose.

Empereur du Maroc was sent out as long ago as 1859. It is one of our very deepest maroons, approaching black as nearly as any. A good and hardy grower, fairly free blooming; not very large, but a grand lasting flower for the coat, and better early and late in the season. Géant des Batailles, the parent of Empereur du Maroc, is over sixty years old, and is still a beautiful dark. One of the very earliest to open. It is rather flat, and has a peculiarly imbricated form, somewhat like a camellia. Very dark, and as the light falls on it some of the most dazzling scarlet tints flash out from among the maroon. A short, but not a bad grower, and a capital flower to last. Eugène Appert, another seedling from the last-named, is even more intense in colour, but a shorter grower.

Grand Mogul and Jean Soupert are very similar, if not actually alike. A large and bold bloom this, very distinctly imbricated, and with such stout petals as to last much longer than most roses. It is especially good late in the season, and comes considerably darker at that time. A good grower, and freer with us upon standards than as dwarfs. Jean Liabaud possesses some darker shades than the last, but it also has more deep red. It is a grand dark, and very sweetly scented. Horace Vernet has a distinct touch of purple amongst its deep velvety crimson shadings. Not always a good grower, but quite unsurpassed where it does do well. An ideal exhibition rose, and simply gorgeous when it comes good.

Charles Lefebvre was sent out in 1862, but was followed by Paul Jamain and Marguerite Brassac. The three are synonymous, and the preference is rightly given to the first named. There is no fault in this rose; the deepest crimson, with a purplish-maroon centre. Sir Rowland Hill is a deep port wine and plum-coloured sport from this, quite distinct as a general rule, but apt to revert to the normal type more often than most sports. Even when it does go back it is a grand rose still. Victor Hugo is one of the most brilliant roses we have. Intense and fiery crimson, deeply shaded with maroon, that changes to purple with age. A grand variety, very sweet, and most reliable. It is freer from red rust than most hybrid perpetuals.

Abel Carrière is another of the old favourites, and it is worthy of note how much we are dependent upon the older introductions for our best crimson and maroon shades. This is more a purplish than a maroon-crimson; a good grower, not particularly large flowers, but lasting well. Unfortunately, it mildews more than the majority of its class. Earl of Dufferin, a rich, brilliant, velvety crimson, shaded with maroon, is grand; rather shy blooming, but a good grower, and throwing a greater proportion of flowers when in standard form.

ODONTOGLOSSUM THEODORA.
A beautiful hybrid raised by De Barri Crawshay, Esq., and awarded a First-Class Certificate at R.H.S. Meeting, April 20. Flowers heavily blotched with rich red-purple on a yellow ground. (See New Plants.)

Perhaps the most popular really dark rose is Prince Camille de Rohan, which has remained unbeaten for forty-six years. A good and free grower, both upon dwarfs or standards, every bud useful in one form or another, and the deepest velvety crimson maroon we have. Lord Macaulay, an old favourite of 1864, must not be missed even if it is not so robust in growth as one would like. Its intense colour, combined with unsurpassed perfume, should keep it in the front for many years yet.

Bardou Job, although only semi-double, cannot be left out of this list. It is the richest of crimsons, shaded with maroon almost up to a purplish-black. In flower from first to last, produces large trusses, and most handsome foliage. Maharajah is a single of immense size; a strong, upright grower, very suitable for pillars, and best early and late; one seldom gets a flower during mid-season, but they are always set among deep green clean foliage of the most substantial type.

One should be able to choose a good dark from the above, but my own choice would be the following six, in the order named: Prince C. de Rohan, Victor Hugo, Charles Lefebvre, Grand Mogul, Bardou Job, and Horace Vernet.

If you want a dark rose as a climber I do not think you can find one to surpass Ard's Rover. It is a good flower, exceptionally sweet-scented, lasts well, and is thoroughly perpetual; a great point among climbing roses. A. P.

FUCHSIAS FOR THE FLOWER GARDEN.

There are few more graceful plants than fuchsias; and few more suitable for filling certain beds in the flower garden. They are quite as hardy as the zonal pelargoniums, and will thrive and flower splendidly in somewhat shady, cool positions which are unsuitable for the zonals. It is really wonderful what a lovely display a number of old specimens will make if planted out in a partially sheltered border. If retained in their pots, the old plants may not make much progress, but when planted out they take a new lease of life, as it were, and prove very satisfactory.

We all know how beautiful standard fuchsias appear in borders, with a suitable groundwork of other kinds of plants which are dwarf growing. Small specimens, turned out of large 60's, also fill a bed very attractively; moreover, the fuchsia is a persistent flowering plant, and gives very little trouble during the summer months beyond staking and the removal of faded flowers.

In the Isle of Wight, and in many parts of the southern counties, fuchsias are largely grown, and quite a number of specimens of the hardy varieties attain to a height of ten feet, and even, in some instances, fifteen feet. I well remember being much struck with one old plant which grew against a cottage wall. It is still there, and is quite fifteen feet high.

Geo. Garner.

FAMOUS LONDON PLANE TREES.

The Wallace Plane.

Growing near the main entrance to Gray's Inn gardens is one of the largest and best developed plane trees in London. It was planted about two hundred years ago, is fully 70 feet high, and with a branch spread of twenty-five yards. The peculiarly gnarled trunk unusual for a plane tree, is about four feet in diameter at a yard from ground level, and is clear of branches for three-parts of its height. The Wallace tree is in perfect health. It is questionable whether any other grounds of equal area in London contain so many large plane trees as may be seen in the Gray's Inn gardens.

The Wood Street Plane Tree.

This famous tree, which stands at the left-hand entrance to Wood Street, from Cheapside, marks the site of St. Peter in Chepe, a church which was destroyed by the Great Fire of London. The terms of the lease of the houses at the West-end corner are said to forbid the erection of another storey or the removal of the tree. This tree, growing in a very confined position, is in a healthy condition, as is evidenced by the young growths which have been sent out since it was pollarded about three years ago. It is gratifying to know that this pruning was, unlike much of such work in London, carried out in a practical and sensible fashion, and has interfered but little with the original appearance of the tree. The smooth, well-rounded stem rises for 30 feet without a branch, the diameter being about a yard through at breast high. As late as 1845 rooks built their nests in this tree.

The Plane in Stationers' Court.

This is a magnificent specimen, though growing in a very cramped and confined position, the branches on all sides nearly touching the surrounding buildings. The specimen is in excellent health, with a large, well-formed stem; but, unfortunately, owing to "snag-pruning" the outline has been rendered somewhat unsightly. This plane tree, which grows in the Court of Stationers' Hall, Ludgate Hill, is much prized by the residents around.

The Dean's Court Plane Trees.

Though growing in a very confined and dusty position these two plane trees have attained to a height of fully sixty feet, and are healthy and well developed.

There are many other large and well-developed plane trees in London, such as those in Cavendish, Russell, and Bedford Squares, and in Lincoln's Inn Fields, all of which clearly point out how well-suited the plane is for battling with the impurities of a town atmosphere.

A. D. Webster.

Pruning Roses.—Roses are likely to be a source of worry and anxiety to growers for the best part of this season. Much of the sappy growth of last year is blackened by the severity of the past winter's frost, but with dwarf roses this is immaterial, so long as the base is sound and healthy: but it is otherwise with climbing and free-growing varieties, so largely employed in garden decoration. A wise policy will be to average the shoots, retaining the healthiest or those parts that seem capable of maturing a crop of flowers, and then head a number hard back or at various distances, so that in the event of failure with this year's crop, abundant material may be early developed, and subsequently ripened, to take its place for another year.—Thomas Smith.

CROQUET LAWNS.

The Size and Setting Out.

I have noticed from time to time that inquiries are made through the medium of the GARDENERS' MAGAZINE relative to the size and setting out of croquet lawns. As a member of the committee of the Croquet Association, may I be permitted to offer a few remarks on the subject, in the hope that they will be of service to some of your readers?

The Croquet Association, whose offices are at 47, Fleet Street, London, E.C., is now the sole authority on all matters relating to the game of croquet. This association issues annually the laws of croquet, in which are contained the size of the lawn, and settings of pegs, hoops, etc. These laws are the official ones, and, as such, are recognised by croquet clubs throughout the British Empire and on the Continent. What the Marylebone Cricket Club is to cricket, that the Croquet Association is to croquet. With a view of perfecting the game, the association annually reviews the laws and revises them when thought necessary. Everyone who has to do with the setting out of croquet lawns, and desires to keep abreast with the times, should obtain an official copy of the laws for the current year. Manufacturers of croquet plant sometimes supply a book of laws, but the purchaser should ascertain whether these laws bear the name of the Croquet Association, and also notice the year of issue. In passing, I may say without breach of confidence that the laws for 1909, with the exception of a few verbal alterations, will be practically the same as those for 1908.

The diagrams of the setting of lawns here given show that the size of a lawn is 35 yards long and 28 yards wide, hoops and pegs being arranged in sevens. In diagram No. 1, where two pegs are used, the measurements are as follows: Peg in centre line of ground 7 yards from the nearest boundary; hoops up centre line of ground 7 yards from peg, and 7 yards apart; corner hoops 7 yards from centre line and 7 yards from the nearest boundaries. Diagram No. 2, an alternative setting to No. 1, but seldom used, has a centre peg instead of two. This peg is equidistant from the corners; hoops up the centre line of ground 7 yards from peg; corner hoops 7 yards from the nearest boundaries.

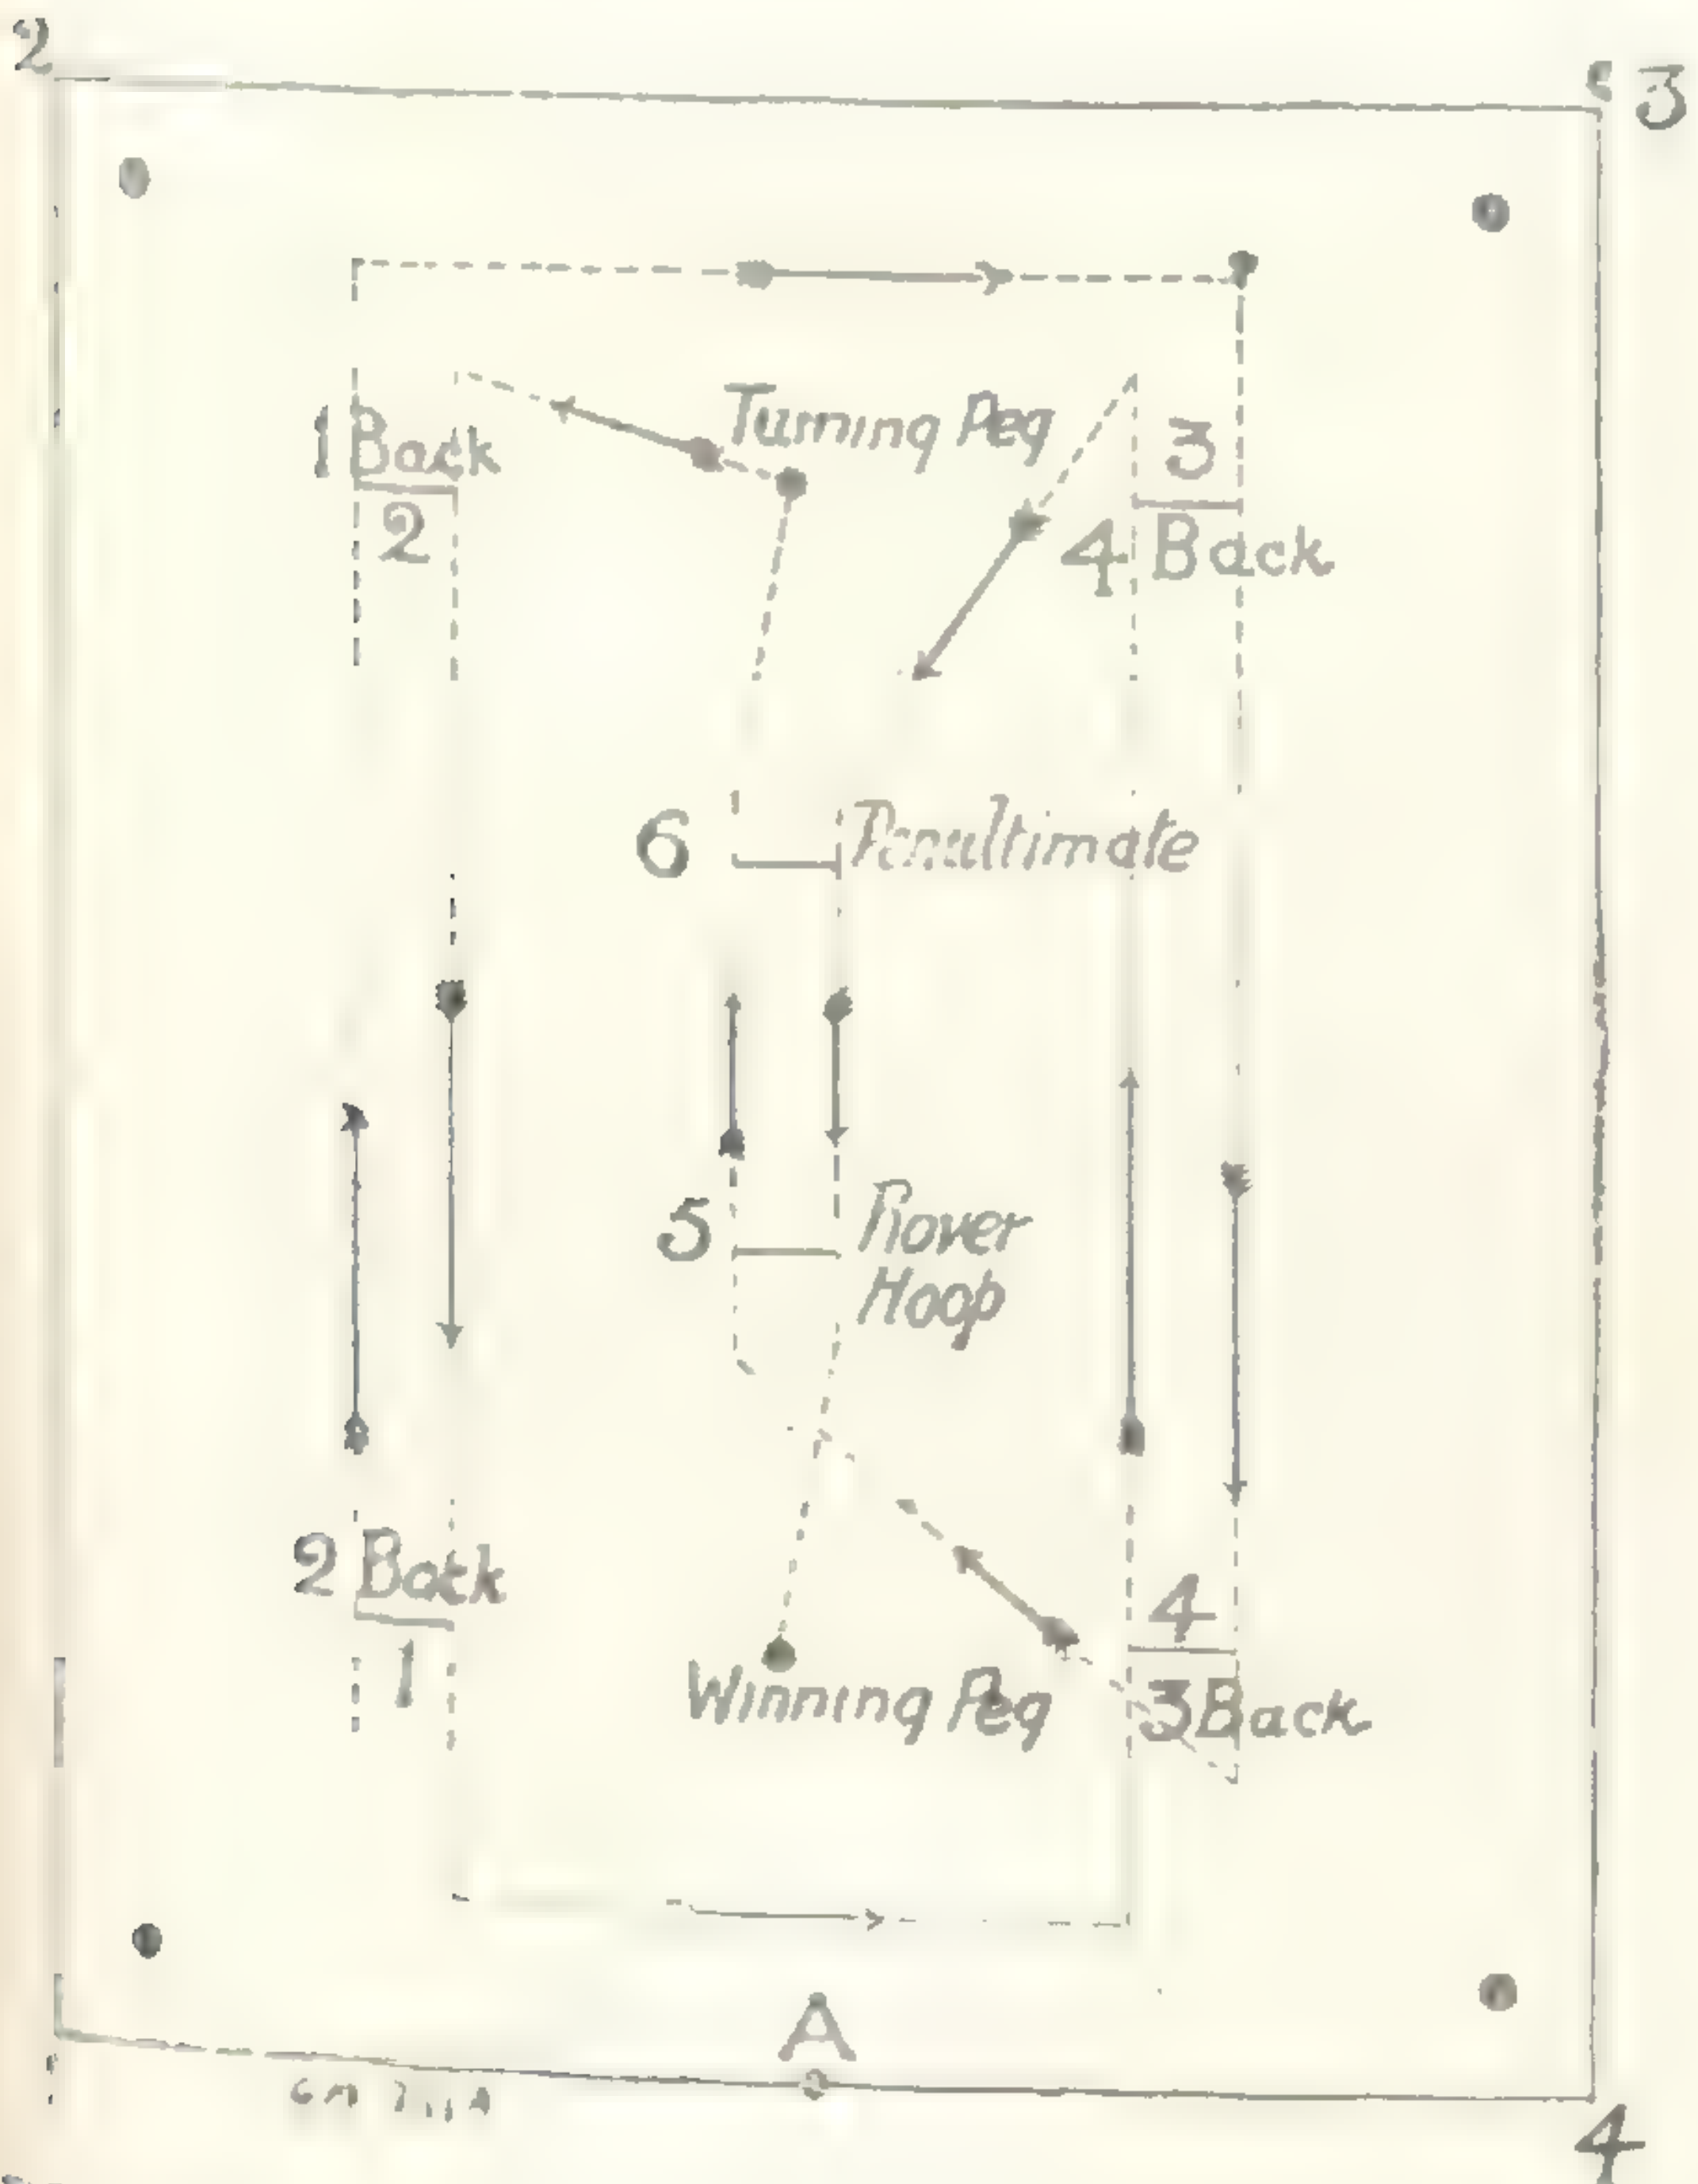


DIAGRAM OF CROQUET LAWN, NO. 1.

The marking out of the croquet lawn is very important. There must be a boundary line on all sides; the spots at the four corners should be indicated, and balk line should also be marked. This balk being "the area within three feet of the boundary, between the spot marked A and the corner marked I on diagram No. 1." A study of the rules will show that all these marks are essential to the game. In marking out a croquet lawn, size or buttermilk should be added to the whiting to make it adhere to the grass. The lines will then not be washed out by rain.

AN ATTRACTIVE CROQUET LAWN, ROCK MOUNT, STAMFORD.

If from lack of space a smaller lawn has to be provided, instead of the lawn being set out in multiples of 7 yards, the setting should be reduced proportionately, say, in multiples of 6, or, at a pinch, 5 yards. But the balk line should always be three feet from the boundary.

JOSEPH H. PEMBERTON.

Apple Lord Burghley.—This is one of the newer varieties, and is not generally known except on the exhibition table, where, however, it does not often make an imposing show. I have grown it now for a number of years, and I have come to the conclusion that in its season—February to April—its quality is second only to that of the Ribston Pippin, to which it bears some resemblance when well grown, both in appearance and flavour, being highly coloured, angular, and the height greater than the breadth. Like all very late apples, it does not come to perfection in a bad season, and always needs to be left on the tree till November. I have found the tree very hardy, and a healthy and fairly vigorous grower, but, owing to its lateness, there is no doubt that for the best results a warm soil is necessary, with as sunny a situation as possible. It is a fair bearer, producing a moderate crop nearly every year. It is not generally recommended for a standard, though I do not know why, but it makes an excellent bush or pyramid, and is suitable for a cordon, being of very regular upright growth, and spurring well. A writer in one of the papers a year or two ago said he had found it the worst grower and the poorest bearer in his collection, and I know of a grower who says pretty much the same thing. Whether the stock or the soil is at fault in these cases I cannot say, but from my own experience I should certainly plant it wherever I had a garden. I may say my soil is a London clay, and that in a cold, low-lying position.—ALGER PETTS.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COCHLIODAS.—There are many less attractive orchids than the three species of this genus that are in general cultivation. Undoubtedly the most attractive is C. Noetzliana, which produces its brilliant orange-scarlet and purple flowers at the present season of the year. Well-cultivated plants are most effective when in bloom, and exceedingly useful for exhibition and the supply of cut flowers. It has also been, and will continue to be, most useful for hybridisation purposes. It is generally found to intercross with most of the oncidiums and odontoglossums. Its influence with the latter genus has resulted in most remarkable, and in most cases desirable, additions to the cool house.

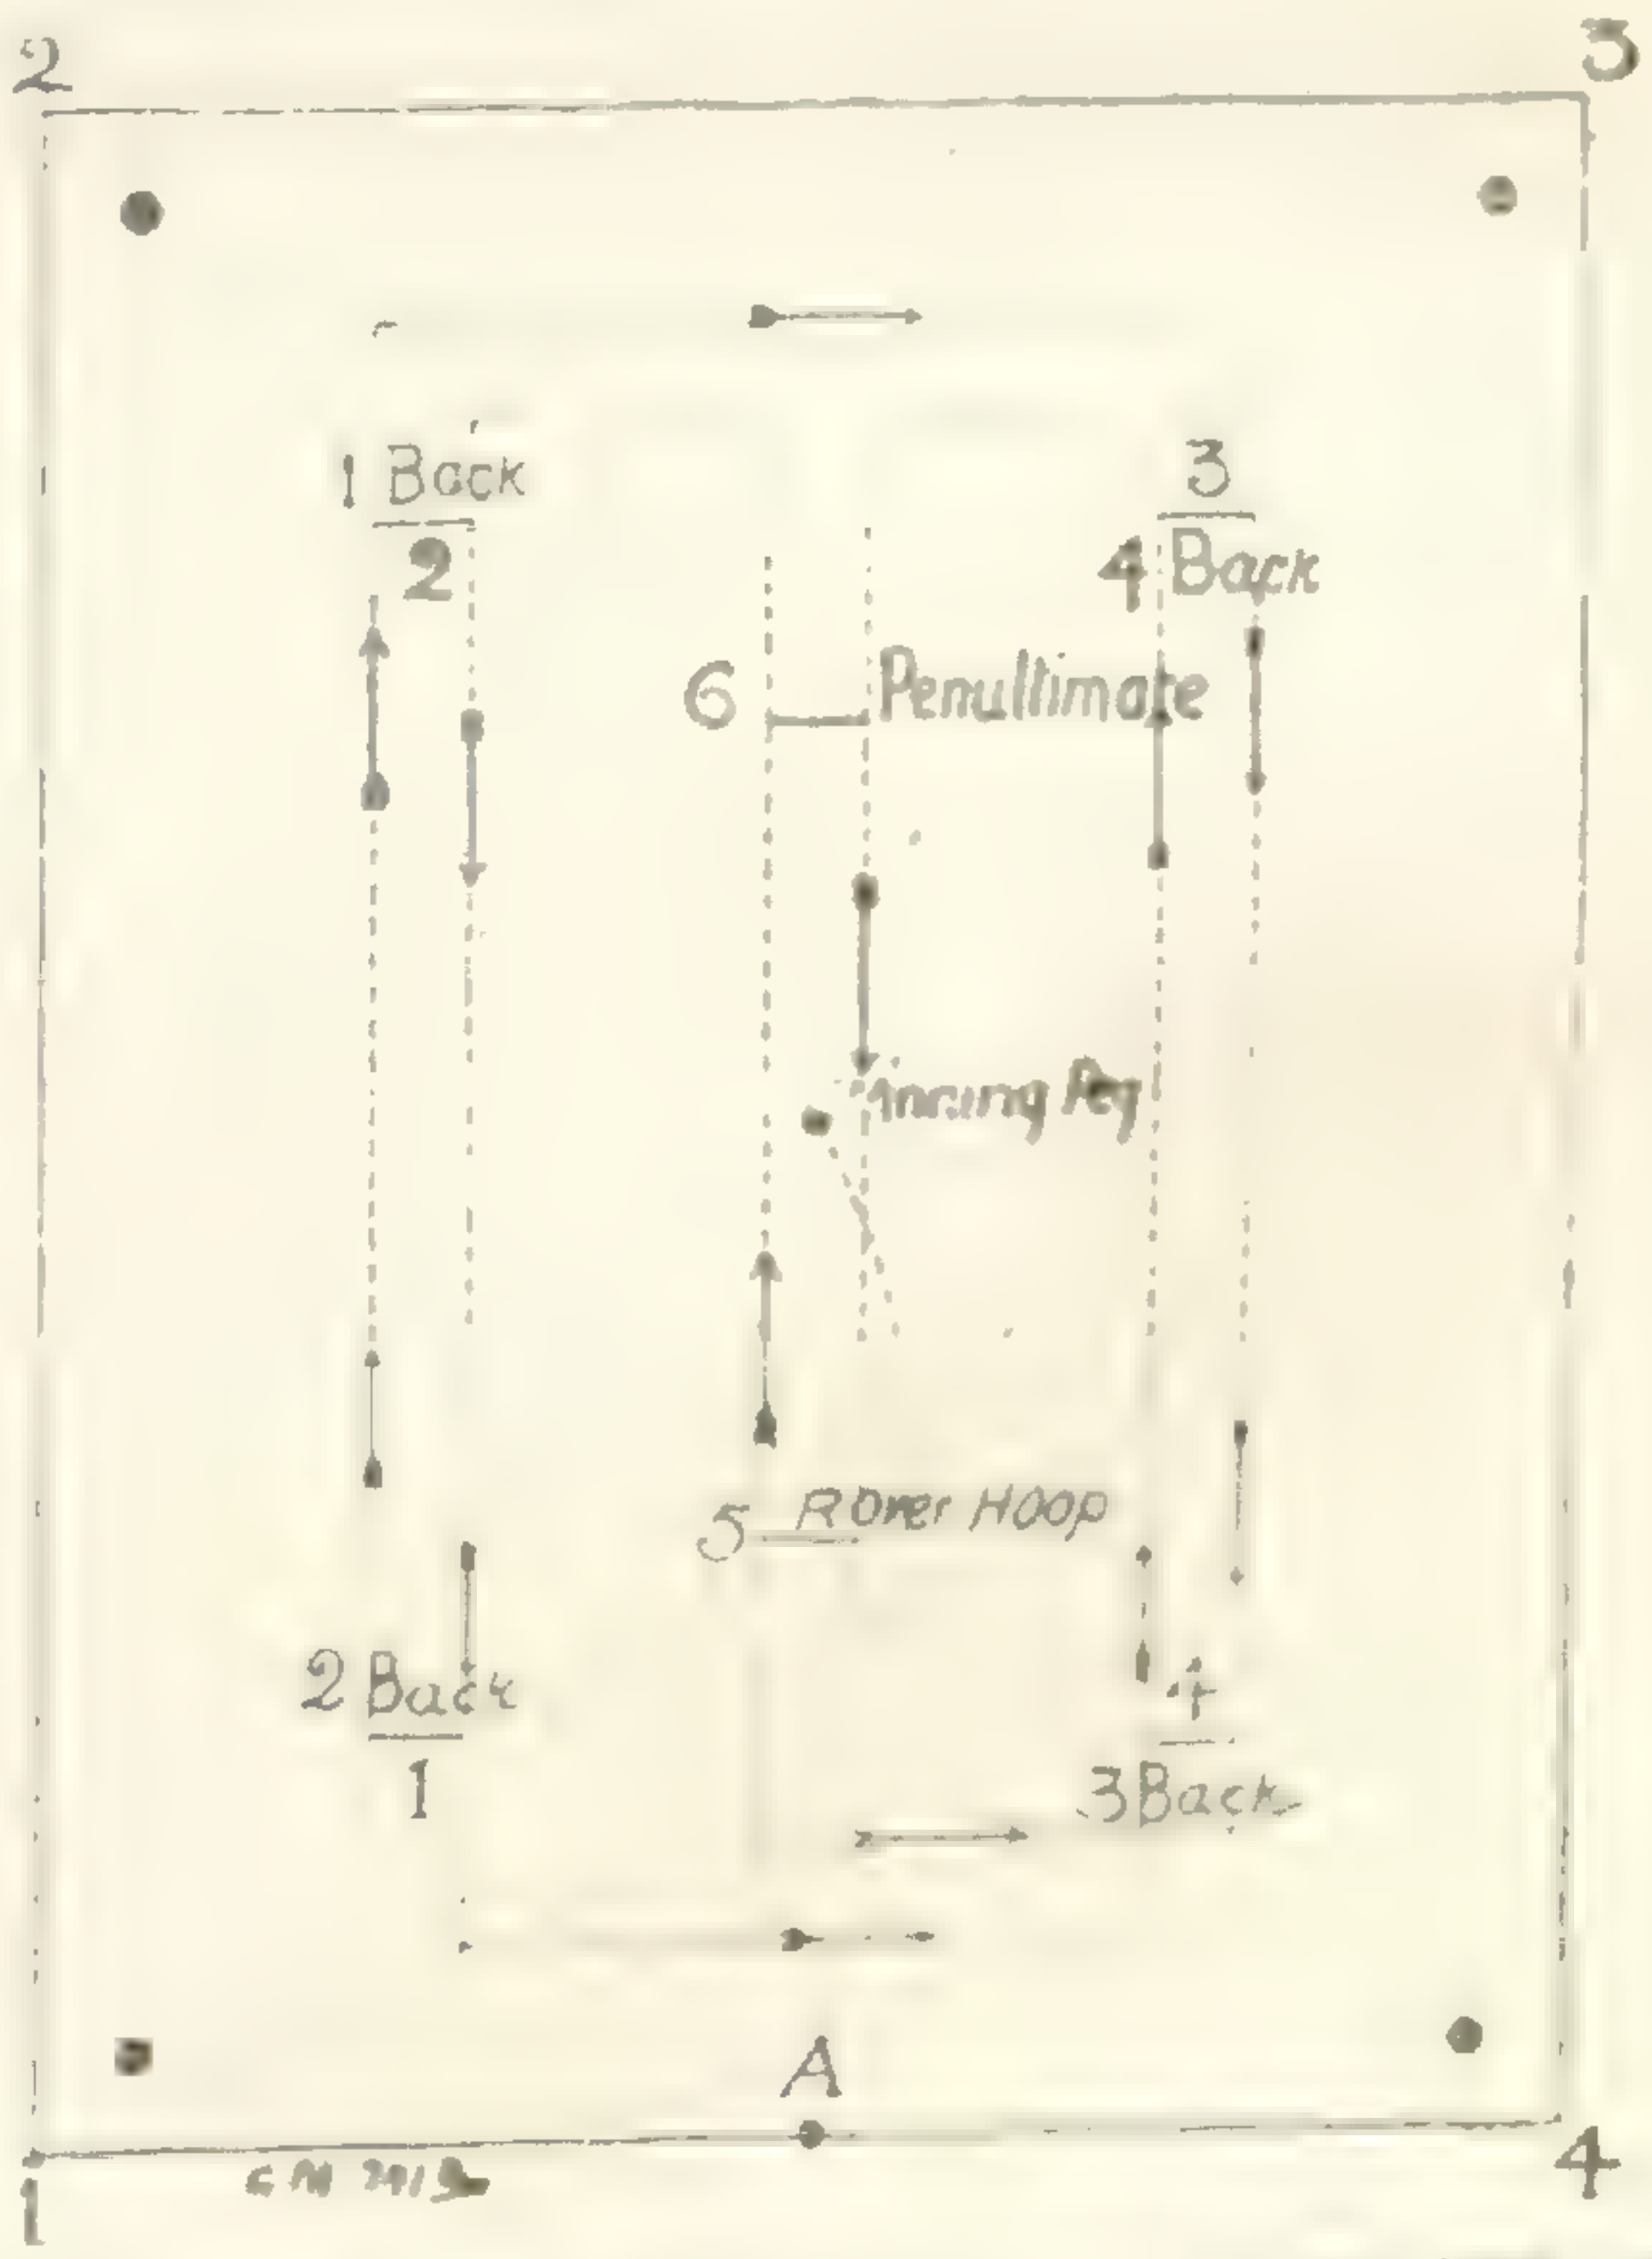

DIAGRAM OF CROQUET LAWN, NO. 2.

CULTURE OF COCHLIODAS.—This may be exactly that of the odontoglossums. I find the plants do not require an abundance of light at any season, and unless they have a cool, shady position during the summer months they are liable to shed their foliage, leaving the pseudo-bulbs leafless, and presenting anything but a desirable appearance. I consider the best time to repot cochliodas is when the new roots make their appearance from the base of the developing growth, which takes place just before the pseudobulb is formed, in autumn or late in spring, according to the conditions under which the plants are grown. The pots used should be clean, and drained to about two-thirds their depth with clean, broken crocks, or, better still, chopped bracken roots. They are practically surface rooters, and thus they do not need a deep potting compost. They are best grown several together in the same pot, thus giving a larger specimen. The potting compost we use consists of equal portions of fibrous peat, chopped sphagnum moss, and broken oak or beech leaves in about equal portions, with sufficient silver sand and broken crocks added to render the compost porous. This compost should be made moderately firm. Rain water must always be used for watering or spraying purposes. During the active growing season, which is the winter months of the year, they must have every encouragement, but excessive watering during this season, especially where the potting compost is in a decomposed condition, will cause the foliage to become spotted, and the tips of the leaves to turn black. During the dormant season only sufficient root moisture is necessary to retain the pseudo-bulbs in a normal plump state.

C. VULCANICA produces its flowers late in the summer, and when it can be induced to grow satisfactorily it is most desirable. Its long, branching spikes of pale rosy-pink flowers are most attractive. It should be grown under the same conditions as described in the preceding paragraph, but repotting requirements are best attended to immediately after the flowers have lost their beauty. C. rosea is a miniature-growing plant compared with the other two species, and is best accommodated when grown in shallow pans or baskets, where they may be suspended near the roof glass. The odontoglossum house treatment suits it, but careful watering is necessary at all seasons of the year. Thrips and green-fly are the most troublesome pests to be contended with, but regular spraying with some safe insecticide keeps these pests in check.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

FLOWERING CLIMBERS, such as dipladenias, stephanotis, etc., will be now making rapid progress. Give close attention to the regulation of growth, and to keeping insects in check by fumigating and syringing while the flower clusters are forming. Give the plants a good position near the glass, and only sufficient shade to prevent the foliage being damaged by powerful sunshine. Provide weak liquid manure while the flowers are forming, and shade from bright sun when in flower.

BOUGAINVILLEAS.—The cool stove or even the conservatory is very suitable for these free-flowering climbers, and the best results are secured when specimens are planted out in a well prepared border over good drainage, and in a mixture of turfy loam, peat, sand, and a good sprinkle of charcoal. Water freely during the growing season, and give very little shading. Few plants provide such an attraction for such a long period, and when freely exposed much pruning will be unnecessary.

THE FERNERY.—Should any plant require potting, the tender roots should be carefully handled; avoid the use of large pots, and stand the plants upon a bed of coal ashes. Give close attention to watering, and when the house is fully exposed to the sun shading will be requir d.

GESNERAS.—Grow these in a brisk heat, with plenty of light and abundance of moisture, and in a compost of two parts fibrous peat, one of leaf-soil, and sand. Provide ample drainage, and place the bulbs just under the surface of the compost. Give water sparingly until growth appears, when more moisture will be needed; but overhead syringing should not be practised. The stock may be increased by cuttings of the young shoots; or matured leaves, if inserted the length of the stalk, in sandy soil, will root freely.

HEATED PITS which have been used for forcing may now with advantage be utilised for stove plants. Such positions are best suited to the requirements of young plants producing short-jointed, sturdy growths. By carefully utilising the early afternoon sunheat, and early closing, a suitable atmosphere and temperature can be secured. Use the syringe freely at closing time, and as growth proceeds endeavour to secure colour by as free exposure to the sun as the plants will bare without injury.

MISCELLANEOUS.—Cuttings of Begonia Gloire de Sceaux and Gloire de Loraine must be put in for late flowering. Tuberous-rooted begonias, when choice varieties are secured, may also be increased by cuttings when the young shoots have attained the length of four to five inches. Begonia socotrana having been kept dry at the roots while resting, will now succeed best in an intermediate temperature. Give attention to climbing annuals, such as ipòmaeas, and prevent them from becoming entangled. Cuttings of justicias, coleus, Eranthemum pulchellum, Manettia bicolor, etc., may also be put in now.—W. Fyfe, Lockinge Gardens.

FRUITS UNDER GLASS.

POT VINES.—These have made excellent progress during the last few weeks, and where the grapes are commencing to colour more air will be required. See that the roots do not suffer from drought, or the bunches will fail to finish satisfactorily. guard also against the attack of red spider, and if an attack is noticed, which can soon be seen by the leaves turning a dull yellow, sponge the leaves at once with a solution of sulphur and milk, and syringe all surroundings frequently with soft water. The sponging must be done several times. A very good plan is to mix a liberal quantity of sulphur with milk, and paint the hot water pipes. This will often prevent a further attack.

FIGS.—The fruits of these will now be approaching maturity, and the trees should be frequently fed with farmyard manure or other fertiliser. The temperature should be kept at from 65 to 70 degrees, but admit air when the mercury is running up, with sunshine, quite early in the morning. Damp down thoroughly in the afternoon, and when the fruits show signs of ripening the use of stimulants should be discontinued. Stop the growths at the fourth or fifth leaf, excepting where extension is necessary, and remove any very weak growths, so that there is no unnecessary crowding. Trees in the later house should be disbudded early, removing all the growths that are not required. Stop the leaders when about five joints have been made, and any growths that have not broken satisfactorily should be removed, as this will make room for young growths to be tied in. The fig is rarely troubled with any insect pest if its wants are thoroughly provided for.

PEACHES AND NECTARINES.—While the fruits are stoning the temperature should not be allowed to become too high, from 55 to 60 degrees being quite sufficient. When it is seen that the fruits have passed the stoning period the temperature should be increased from 5 to 10 degrees, especially if the fruits are required at the earliest period. Attend to the watering, and give copious supplies at this stage, with occasional supplies of liquid manure. Syringe thoroughly twice daily, and shut the house up with sunheat. Set the fruits up with small pieces of wood to expose them to the sun. If this is done carefully they will attain a rich colour. Trees in successional houses should be disbudded promptly, and in the earlier stages of growth thin the fruits where they have set too thickly.

MELONS.—The earliest fruits are now swelling rapidly; give them the support of small nets. A little liquid stimulant once weekly at this stage is beneficial. Syringe thoroughly about 3.30 p.m., and close with strong sunshine, and damp down several times between closing and 10 o'clock.

STRAWBERRIES.—Introduce fresh supplies as often as required, and remove all plants from which the fruit has been gathered as soon as possible.—W. A. Cook, Leonardslee Gardens, Horsham.

THE KITCHEN GARDEN.

BEET.—The sowing of seed of the main crop of beet may now be ventured. Extra-large roots are not desirable, as invariably they are too coarse in texture and clumsy for use. Nicely-shaped, medium-sized roots are much preferred, especially for salad purposes. Land that is not too rich, and has been laid up early enough to have had full exposure to the frost, will be more suitable for this crop. A day should be selected for sowing when the surface is dry, to prevent it settling down too firmly after rain. Draw drills from 12 to 15 inches apart, and sow somewhat thickly, as the young plants, just as they are appearing above ground, are very liable to attacks from slugs. Light dressings of soot and lime periodically are helpful in warding off these pests. Pragnell's Exhibition and Sutton's Red are good in shape and of fine quality.

TURNIPS.—A large sowing of seed of a good type of Snowball turnip, if made now in a rich, cool quarter of the garden, will yield a profitable supply over a long time, and will succeed the early sowing made on the south borders. At this time of year the turnip fly often becomes very troublesome. Bentley's quassia extract has, with me, been the most effectual remedy for it. Work the Dutch hoe frequently between the young plants to promote quick growth.

ASPARAGUS BEDS.—The plants will be making their growth, and may be much assisted by waterings of liquid manure, and with light applications of nitrate of soda or salt. Keep the beds free from weeds, and entrust the work to an experienced hand, or damage may be done to the young growths below the ground. Thin out the young seedling plants before they attain much size, and become drawn; at least 12 inches should be allowed between each plant.

MULCHING.—Where time and material can be spared, mulching is of great service to growing crops, more especially so on light land. Early peas on south warm borders, if established, and now given a watering of liquid manure, and each side of the row covered with peat moss litter or other manure will amply repay the attention. Early cauliflowers in similar positions will be benefited, and the returns from them be much greater if top-dressed. Broad beans that were sown early for first pickings will be aided by this treatment. Also such crops as lettuces that have stood the winter and are hearting.

PARSLEY.—The early-sown seeds under glass will have produced plants sufficiently large for pricking out into beds in the open. Do not select a position that has just previously been occupied with the brassica family, as parsley enjoys a rich soil, and it is of the utmost importance that the latter should be free from wireworms. Work soot into the soil, and place the plants about one foot apart to secure the finest leaves. Drawn stems very quickly damp off and rot when overcrowded, and are worthless for standing the winter frosts. Sow again outside to ensure against failure.

WINTER GREENS AND LATE BROCCOLIS.—Make a sowing of late kales of the hardy kinds that have proved most useful, these being indispensable during severe winters when other greens are cut down. Late broccolis, too, are most valuable, and the sowing should not be delayed after the early part of May. The old favourite, Veitch's Model, has stood the winter here for years much better than some newer varieties, and should be grown largely. Sutton's May Queen can also be recommended.—Chas. Flack, Cholmondeley Castle Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Midland Daffodil Society.

The annual exhibition of the Midland Daffodil Society, held at the Botanical Gardens, Edgbaston, is a festival looked forward to with the very greatest of interest by all enthusiastic daffodil lovers, trade or amateur. The exhibition held this year, on April 22 and 23, was of unusual interest because of the visit of a deputation from the Royal Horticultural Society, which deputation, composed of Mr. H. B. May, Mr. E. A. Bowles, Mr. A. Kingsmill, and Mr. C. H. Curtis, made awards on behalf of the Royal.

There was a keen competition throughout the classes, with one or two exceptions, and the flowers were, on the whole, of a very high order of merit. New daffodils were very much to the fore, and the great successes of the meeting fell to Mr. E. M. Crosfield and Messrs. Cartwright and Goodwin, while Mr. P. D. Williams, Mr. W. T. Ware, Messrs. Barr and Sons, Messrs. J. R. Pearson and Sons, Messrs. Pope and Son, and Mr. F. H. Chapman all contributed novelties.

MESSRS. BARR AND SONS' GOLD MEDAL COLLECTION OF DAFFODILS.
Midland Daffodil Society's Exhibition at Birmingham.

In the matter of entertainment and help and attention in every direction, the Birmingham people, led by Mr. Robert Sydenham, behave right royally. There was luncheon in the gardens that look so beautiful, and are so vastly interesting under Mr. Thomas Humphrey's care, and at the end of the first day there was dinner at the Grand Hotel, given by Mr. Sydenham to about a hundred exhibitors, judges, and others associated with the daffodil industry. The only weak point about the Midland Daffodil Show is the lack of proper arrangements with the Clerk of the Weather. For several years past the weather during show time has been wretched, and this year was no exception to the rule.

OPEN TO ALL.

There were four competitors in the leading class for fifty varieties of daffodils, these to fairly represent the three leading groups of large, medium, and small-crowned varieties. There was a splendid fight for the premier award of £5 5s., and here Mr. E. M. Crosfield, Cossington House, Bridgwater, secured the first place with a grand lot of blooms, the majority being new seedlings of his own raising, all in beautiful condition. A few of the finer things were Bedouin, Castor, Hamlet, Leyden Jar, Cassandra, Sceance, Incognita, Cœur de Lion, Honey Bird, Mrs. E. M. Crosfield, Mermaid, Lotus, Bansai, Lord Roberts, Lucifer, Eyebright, Anchor, Almira, Prelude, Lilith, Northern Light, and Inez. Messrs. Cartwright and Goodwin, Kidderminster, secured the second prize with a delightfully well set-up group of new varieties, in which Trimpley Gem, Circlet, Heroine, White Queen, Amazon, Homespun, Fairy Queen, Sir Philip Sidney, Solfaterre, Giraffe, Weardale Perfection, Lady M. Boscawen, Incognita, and Diamond, were among the best. Third place fell to Messrs. J. Pope and Son, King's Norton, for a good set, and Mr. F. H. Chapman, Rye, came fourth with another good set.

The best dozen varieties of long trumpet daffodils, three flowers of each, was a fine set staged by Messrs. Cartwright and Goodwin, Kidderminster, who showed substantial, fresh, and bright blooms of Weardale Perfection, Peter Barr, King Alfred, Lord Roberts, Hamlet, Mdme. de Graaff, Cygnet, Mrs. J. H. Veitch, Alice Knights, Admiral Makaroff, Horsfieldi, and Empress. Messrs. Pope and Son were placed second, Mr. James Douglas, Great Bookham, Surrey, third; and Mr. J. Mallender, Bawtry, fourth.

For half a dozen varieties of short trumpet daffodils Messrs. Cartwright and Goodwin won the premier place with an exquisitely beautiful set of Lowdham Beauty, Lemon Star, Heroine, Giraffe, Arnold Rogers, and Lady M. Boscawen; Mr. James Douglas was second with Great Warley and Lady Margaret Boscawen, in grand condition; Messrs. Pope and Son third. Premier place for a dozen varieties of large cupped daffodils was also secured by Messrs. Cartwright and Goodwin, Kidderminster, with superb examples of Evangeline, Duke of Leinster, Lucifer, Northern Light, Diana, Princess Mary, White Cloud, Ayaconora, Blackwell, Marina, Fairy Queen, and Homespun. Messrs. Pope and Son, second; Mr. James Douglas, third; and Mr. J. Mallender, fourth.

Messrs. Cartwright and Goodwin were again first in the class for a dozen varieties of small cupped daffodils, showing clean, pretty flowers of White Slave, Scarlet Eye, Eyebright, Redbreast, Oriflamme, Ethelbert, Inga, Dorothy, Fusilier, Circlet, Alton Lock, and Tom Tit, all charming varieties. In the class for six distinct varieties of poeticus daffodils, Messrs. Cartwright and Goodwin again scored, this time with Sir John Suckling, the pretty, new Oliver Goldsmith, Laureate, Juliet, Rhymester, and Cassandra; Mr. F. H. Chapman second; and Mr. W. A. Watts, St. Asaph, third.

For half-a-dozen flat-cupped varieties Messrs. Cartwright and Goodwin again came to the front with Armeline, Incognita, Coreen, Dorothy Pearson, Mariette, and Amyas Leigh, in fine condition; Messrs. Pope and Son, second. The three best double daffodils were Gollywog, Red and Gold, and Argent, shown by Messrs. Cartwright and Goodwin; Mr. James Douglas second, and Messrs. Pope and Son third. A second prize was awarded to Messrs. Cartwright and Goodwin for six varieties of bunch-flowered daffodils, Aspasia and Elvira being the best.

In the single bloom classes Mr. J. Mallender led with King Alfred (trumpet); Mr. E. M. Crosfield for Phantasy (white trumpet); Mr. Crosfield for Buttercup (short trumpet); Mr. Crosfield for Bernardino (large cup); Mr. P. D. Williams for Famille Verte (small cup); and Mr. Crosfield for Pixie (flat cup).

In a special open class the Rev. Thomas Buncombe scored for six vases of decorative, moderately-priced daffodils, selected from a provided list of varieties, and he won with nine vases of Barri conspicuus, Leonie, John Bain, Flora Wilson, Emperor, and Frank Miles; Mr. Cryer, gardener to J. A. Henrick, Esq., Barrow Court, Edgbaston, second; and Mrs. E. Deakin, Hay Mills, third.

AMATEURS ONLY.

Premier award for a collection of twenty-five varieties (bulbs not to cost more than 15s. each) was secured by Mr. N. J. Lower, Presteign, with a beautifully clean set of flowers that included Gloria Mundi, Madame de Graaf, Weardale Perfection, Madame Plemp, Horace, and Albatross; Mr. H. B. Young, Metheringham, second, and the Rev. Thomas Buncombe, Black Torrington, third. No fewer than eleven competitors entered in the amateur class for nine varieties of long trumpet daffodils, and here the premier position was filled by Rev. Thomas Buncombe, Black Torrington, who had grand blooms of Weardale Perfection, Emperor, Madame de Graaff, etc.; Mr. H. B. Young, Metheringham, second; Rev. G. P. Haydon, Canterbury, third; and Mrs. Gumbleton, Tewkesbury, fourth.

In the interesting class for nine varieties of large-cupped daffodils there were eight competitors, and the Rev. Thomas Buncombe led with Barri conspicuus, Minnie

Hume, and Artemis, etc., in fine style; Rev. G. P. Haydon, second; Mr. H. B. Young, third; and Mr. N. J. Lower, Presteign, fourth. Out of three entries the Rev. G. P. Haydon scored for nine varieties of small-cupped daffodils, Rev. Thomas Buncombe coming second, and Miss Mabel Williams, Scorrier, Cornwall, third.

The Rev. G. P. Haydon was first, Rev. Thomas Buncombe second, and Mr. N. J. Lower third for three flat-cupped varieties. The Rev. G. P. Haydon led for three varieties of double daffodils with fine specimens of Codlins and Cream, Golden Rose, and Eggs and Bacon; Mrs. Gumbleton, Tewkesbury, second; and Mr. Usher, gardener to J. A. Kenrick, Esq., Harborne, third. The Rev. Thomas Buncombe led for three varieties of bunch-flowered daffodils, with Aspasia, Irene, and Elvira; Mr. Cryer second, and Mr. W. H. Parton third. There were eight entries of six varieties of daffodils, any classes, and the first prize was won by Mr. H. B. Young, Metheringham, second by Mr. N. J. Lower, and third by Mr. W. Marple, Penkridge.

MAIDEN GROWERS.

In this division only those who had never won a first or second prize at the society's shows can compete, and those who exhibit must not stage varieties costing more than 1s. per bulb.

Mrs. W. F. Mitchell, Warwick, secured first prize for a dozen varieties of daffodils, all sections, not to cost more than 1s. per bulb; Mr. H. R. Darlington, Potters Bar, second; and Mr. A. Taylor, Acocks Green, third. For six varieties of trumpet varieties, costing not more than 1s. per bulb, Mr. A. Taylor led, with Mr. H. R. Darlington second, and Mr. H. J. Jones, Ludlow, third.

First prize for six large-cupped varieties, not costing more than 1s. per bulb, was won by Mr. H. R. Darlington, Potter's Bar, with C. J. Backhouse, Fairy Queen, Crown Prince, Constellation, Blackwell, and Barri conspicuus; Mr. H. J. Jones, second; and Mr B. Bowen, Ludlow, third. For six small cupped varieties, the first prize fell to Mr. H. R. Darlington, who also led for three varieties of double daffodils.

SEEDLINGS AND NEW DAFFODILS.

Premier place, and the beautiful Bourne Cup, for twelve new seedling daffodils, raised by the exhibitor, was won by Mr. E. M. Crosfield, Cossington House, Bridgwater, with some superb blooms, some of the most beautiful were the drooping Honey Maid, the broad-cupped Gaybird, the white Casilda, and the splendid white trumpets Ecru and Phantasy; Mr. P. D. Williams, Caerhays, Cornwall, second; and Mr. J. C. Williams, Gorran, Cornwall, third.

Mr. S. T. Batson, Beaworth, led for six seedling daffodils raised by the exhibitor and not in commerce, with some good flowers, and a specially fine thing in Aktis, with a scarlet cup; Messrs. Pope and Son second, and Mrs. C. H. Cane, Mangotsfield, third. Mr. F. H. Chapman annexed the first prize for three new seedling daffodils with the white Spindrift and bright blooms of Henry James and Signal, the latter a descendant from Blackwell.

The Cartwright Cup, offered for the best set of twelve new varieties of daffodils, not in commerce more than four years, was won by Mr. E. M. Crosfield, who showed grand trumpet varieties named Silver Sheen, Artus, Ecru, Phantasy, Chandos, Herod, Honey Maid, etc.; Messrs. Cartwright and Goodwin second, and the Rev. G. P. Haydon third. First prize for six distinct new seedlings was won by Messrs. Pope and Son, King's Norton, whose Bert Sands was a pretty bicolor; Mr. F. H. Chapman, Rye, second.

POT PLANTS AND DECORATIVE CLASSES.

Mr. A. Coger, Berrow Court Gardens, led for a dozen pots of daffodils, distinct, his Glory of Leiden, Sir Watkin, Mdme. de Graaff, and Empress being particularly good; Mrs. E. Deakin, Hay Mills, second. For six pots, Mr. Usher was first, and Mr. J. Seeaney, Harborne, second. Mr. Cryer led for a dozen pots of tulips with a grand exhibit, and was followed by Mr. W. H. Parton, Kingswood Grange, Hollywood. For six pots, Mr. Usher led.

In the decorative classes, Messrs. Pope and Son led for a bowl of daffodils, Mr. John Seeaney second, and Mrs. E. Deakin third. For an epergne of daffodils, Mrs. E. Deakin led, followed by Messrs. Pope and Son and the the Rev. J. Jacob, Whitewell Rectory, Whitchurch. For a table decoration, Mr. J. Seeaney, Harborne, was placed first for a rather thin design of daffodils; Miss Clarke, Sparkrooke, second, with poeticus flowers; and Messrs. Pope and Son third.

NON-COMPETITIVE.

There were numerous excellent non-competitive displays arranged in the exhibition house and the adjoining palm house, and these added considerably to the interest and attractiveness of the meeting.

Messrs. Barr and Sons, Covent Garden, presented a fine array of both popular and choice new seedling daffodils, and arranged these in front of the orchestra. It is difficult to make a selection of varieties, and useless to describe unnamed seedlings, however good they are; but we made special note of Mrs. Bettridge, Homespun, Zoe, Maggie May, Weardale Perfection, Cossack, Ibis, Bedouin, Buttercup, Czarina, Circlet, Ethelbert, Symbol, Blackwell, G. P. Haydon, Torch, Mdme. de Graaf, etc. Mr. H. D. Phillips, Olton, Birmingham, contributed a fine lot of the newer daffodils, and set up his flowers admirably, these including Homespun, Petticoat, White Hart, King Alfred, Sappho, Lucifer, J. B. M. Camm, Seagull, etc.

Exquisitely beautiful were the new daffodils charmingly shown by Mr. Charles Dawson, Gulval, Penzance. Of course, a great number were absolutely new and unnamed seedlings, but among the named varieties there were lovely flowers of the very beautiful Dawn, Princess, Buttercup, Lavender, Tennyson, Cossack, Hypatia, Pilgrim, Famille Vert, and Red Chief. Miss F. W. Currey, Lismore, Ireland, had a group of very beautiful daffodils, and showed a very fine selection of the newer and finer varieties, the following being a selection of the best: Firecrest, Vanity, Mrs. Robert Sydenham, Enid, Lucifer, Albatross, Lady of the Snows, Strongbow, Beacon, Lohengrin, Atalanta, Beacon, Magpie, Blood Orange, Gloria Mundi, Ermine, and Primrose Phœnix.

Sir Jocelyn Gore Booth, Lissadel, Ireland, had a very pleasing exhibit of choice daffodils, the flowers all very fresh and bright. The leading varieties, shown in goodly bunches, were Gloria Mundi, Oriflamme, Judge Bird, Waterwitch, Madge, Argent, Madame de Graaff, Albatross, Torch, Seagull, Egret, Mrs. Percy Foster, and Incognita. The orange and deep yellow colouring was finely developed in these flowers. Messrs. J. R. Pearson and Sons, Lowdham, Notts, contributed a very attractive exhibit of beautifully fresh and handsome daffodils arranged with an edging of Heavenly Blue muscaris. Chief among the lovely newer varieties were Hon. Mrs. Franklin, Lowham Beauty, Florence Pearson, Lady Margaret Boscawen, Vanille (sweetly vanilla scented), Gloria Mundi, Magnet, Mrs. Robert Sydenham, The Sirdar, Scarletta, Lord Kitchener, and Apricot; there was also a magnificent round-flowered golden Ajax seedling with reflexing mouth to the trumpet, that was greatly admired; this was unnamed.

Messrs. Walter T. Ware, Inglescombe, Bath, showed three large bunches each of Queen of the West—their grand new golden trumpet daffodil; the double Dubbloon, the bright-cupped Firebrand, and three magnificent blooms of the immense bicolor, Great Warley. Messrs. W. H. Simpson and Sons, Birmingham, contributed a large group of popular daffodils, showing large bunches and pots full of Emperor, Empress, Horsfieldi, Sir Watkin, and other fine free-flowering sorts.

For the purpose of further demonstrating the usefulness of the culture of bulbs in fibre in undrained pots, Mr. Robert Sydenham, Birmingham, arranged a large group of daffodils, tulips, and lily of the valley in ornamental bowls and pots of varying size, these making up a pretty and fragrant display. Messrs. Hogg and Robertson, Mary Street, Dublin, associated gorgeous tulips with their daffodils, and made a brilliant group. Of the latter they had fine blooms of Lovelace, Countess Cadogan, Lucifer, Lady Godiva, Lady M. Boscawen, White Lady, King Alfred, J. T. Bennett-Poe, and Mrs. J. Thorley.

Messrs. Sutton and Sons, Reading, arranged a very pleasing group of cinerarias in the palm house, setting up a beautiful lot of refined and rather dwarf stellate varieties, with supporting groups of rose and pink florists' forms grandly grown, Perfection stocks, and fragrant mignonette, the whole making up a very attractive exhibit. Mr. H. N. Ellison, Bull Street, West Bromwich, was represented by a group of interesting ferns, the chief feature of which were the numerous pretty varieties of the newer nephrolepis. Mr. T. E. Dawes, Syderstone Nurseries, Norfolk, exhibited wonderfully fine roots of his new and particularly good new rhubarb, named Dawes' Challenge, figured in our issue of April 17. This variety is finely coloured, and the stems are of great length.

A charming rock garden exhibit, made by Messrs. Bakers, Wolverhampton, was a source of great interest to the many visitors. In this exhibit Trillium grandiflorum, Primula viscosa, P. Cockburniana, P. Mrs. Wilson, P. denticulata, P. d. alba, P. japonica, P. rosea, Incarvillea Delavayi, Saxifraga pyramidalis, and various irises were planted in pretty colonies, and the too frequent mistake of cramming such an exhibit with a multitude of small plants of a great variety of subjects had been carefully avoided. The large group put up by Messrs. Gunn and Sons, Olton, consisted of a background of forsythias, mollis, and Ghent azaleas, rhododendrons, and Japanese maples, with groups of moisture-loving and alpine plants in the foreground, with Iris Susiana, and Primula japonica as special features. A pretty exhibit of perpetual carnations was arranged in large vases by Mr. S. Mortimer, Farnham, Surrey, who had lovely flowers of Enchantress, Rose Pink Enchantress, Brittannia, Winona, Miss Burnett, Lady Bountiful, Black Chief—the new crimson, Marmion, and Robert Craig.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Daffodil Queen of the West, from Messrs. Walter T. Ware, Bath.

To Daffodil Homespun, from Mr. H. D. Phillips, Olton.

Award of Merit.—To Daffodil White Slave, from Mr. H. D. Phillips.

To Daffodil, St. George, from Messrs. Barr and Sons, Covent Garden.

To Daffodil Bedouin, from Mr. E. M. Crosfield, Cossington House, Bridgwater.

To Daffodils Scarlet Gem, Giraffe, and Red and Gold, from Messrs. Cartwright and Goodwin, Kidderminster.

To Daffodil Red Chief, from Mr. Chas. Dawson, Gulval, Penzance.

To Daffodil Lowdham Beauty, from Messrs. J. R. Pearson and Sons, Nottingham (R.H.S. Award).

R.H.S. DEPUTATION AWARDS.

Gold Medal.—Mr. Chas. Dawson, Gulval, Penzance, for new daffodils; Mr. E. M. Crosfield, Bridgwater, for new daffodils in competitive classes; Messrs. Cartwright and Goodwin, Kidderminster, for new daffodils in competitive classes.

Silver-Gilt Flora Medal.—Messrs. Barr and Sons, Covent Garden, for daffodils; Messrs. J. R. Pearson and Sons, Lowdham, for daffodils.

Silver-Gilt Banksian.—Mr. H. D. Phillips, Olton, for daffodils; Sir Josslyn Gore Booth, Lissadel, Sligo, for daffodils; Mr. P. D. Williams, Caerhays, Cornwall, for new daffodils; Messrs. Pope and Son, King's Norton, for daffodils; Messrs. Bakers, Wolverhampton, for rock garden; Messrs. Sutton and Sons, Reading, for cinerarias.

Silver Flora Medal.—Miss F. W. Currey, Lismore, Ireland, for daffodils; Mr. F. H. Chapman, Rye, for daffodils.

Silver Banksian. — Messrs. Simpson and Sons, Birmingham, for daffodils; Messrs. R. H. Bath, Lim., Wisbech, for daffodils; Mr. R. Sydenham, Birmingham, for bulbous plants; Messrs. Hogg and Robertson, Dublin, for daffodils; Mr. S. Mortimer, Farnham, for carnations; Messrs. Gunn and Sons, Olton, for hardy flowers; Mr. H. Ellison, West Bromwich, for ferns.

Special Commendation.—To Messrs. Walter T. Ware, Lim., Inglescombe, Bath, for new daffodils.

MEDALS.

Premier medals for highest points gained in competition in the several sections: Messrs. Cartwright and Goodwin, Kidderminster; Rev. Thomas Buncombe, Black Torrington, and Mr. A. Cryer, gardener to J. A. Kenrick, Esq., Edgbaston.

Gold.—Messrs. Barr and Sons, Covent Garden, for daffodils; Messrs. Bakers, Wolverhampton, for rock garden.

Silver Gilt.—Mr. H. D. Phillips, Olton, for daffodils; Mr. Chas. Dawson, Gulval, Penzance, for daffodils; Miss F. W. Currey, Lismore, Ireland, for daffodils; Messrs. Sutton and Sons, Reading, for cinerarias.

Silver.—Messrs. R. H. Bath, Lim., Wisbech, for daffodils; Messrs. J. R. Pearson and Sons, Lowdham, for daffodils; Sir J. Gore Booth, Lissadel, Sligo, for daffodils; Mr. S. Mortimer, Farnham, for carnations; Mr. R. Sydenham, Birmingham, for bulbous plants; Messrs. Gunn and Sons, Olton, for hardy flowers.

Ipswich Daffodil Show.

One of the best spring shows ever held by the Ipswich and East of England Horticultural Society took place on April 22 and 23 in the Public Hall, Ipswich. Both the hall and the saloon were well filled with exhibits.

In the section open to amateurs without restriction to the number of employees, Mr. A. Sparke, gardener to F. L. Bland, Esq., led for a collection of two dozen varieties of daffodils, Seagull, Albatross, Lucifer, Mdme. de Graaff, Victoria, and Glory of Leiden being especially fine; Mr. H. G. Strutt, gardener to W. P. Burton, Esq., was second. For a dozen varieties Major W. O. Cautley, Norton, Bury St. Edmunds, led, and showed excellent blooms of Duke of Bedford, Lucifer, Weardale Perfection, etc.; Mr. J. Clarke, gardener to W. Pipe, Esq., Rushmere, second. For twelve varieties, one bloom of each, Mr. A. Sparke again secured the leading award, his Weardale Perfection being an unusually fine example; Major Cautley second, and Mr. S. Farrow, gardener to Mrs. Luther Holden, Pinetoft, Ipswich, third.

For three bunches of yellow Ajax daffodils Mr. Donald C. Warnes, Bramford, led, and was followed in order by Major Cautley and Mr. R. Dow, Lowood, Hasketon. For white or sulphur Ajax varieties Mr. Sparke and Major Cautley took the awards, while for bicolors of the same class the same two competitors held similar positions. The best trumpet daffodil in this section was the Weardale Perfection, staged by Mr. G. H. Saville, of Woodbridge, and it gained Major Cautley's silver medal.

In the medium-crowned section Major Cautley scored for incomparabilis varieties, and for Leedsi forms, and was second to Mr. Sparke for Barri varieties. Other winners were Mr. D. C. Warnes, and Mr. Saville, and the varieties best shown were Sir Watkin, Barri Conspicuus, Beauty, Katharine Spurrell, and Seagull, the latter, exhibited by Mr. Sparke, winning a silver medal as the best bloom in its section.

Mr. Sparke, Mr. Saville, and Major Cautley were placed in order of mention for three bunches of small-crowned daffodils, and Mr. Saville won the silver medal for best bloom with a good flower of Horace.

The class for a dozen flowers of Sir Watkin brought out a dozen or so of competitors, Mr. Saville, Major Cautley, and Mr. Sparke sharing the honours. For a dozen flowers of Barri conspicuus Mr. Dow, Mr. Warnes, and Mr. Sparke secured the awards as named.

In the smaller classes Mr. Saville, Mr. Bradbury, Mr. A. Turner, and Mr. R. Death, Capel St. Mary, were the leading prizewinners.

In the plant classes there were also some excellent exhibits. Mr. H. G. Strutt scored for a group arranged for effect, followed by Mr. H. J. Southgate, Spring Road Nursery, and Mr. Porley, Hounslow Road. Mr. R. C. Notcutt, Ipswich and Woodbridge, led for one palm, and for three palms. Mr. Porley had the best three lilacs in pots. Mr. W. F. Paul, Orwell Lodge, Ipswich, had the best specimen of Azalea indica, finely flowered, and also the best Azalea mollis, and the best herbaceous calceolarias. Mr. R. Dow was first for hyacinths in pots and daffodils in pots, showing the latter very well; he also had the best six bunches of spring flowers, his wallflowers and Crown Imperials being notably good. Mr. J. E. Grant, gardener to W. H. Burroughes, Esq., Ancaster Road, had very fine spiræas, both in the S. japonica and the S. astilboides classes. Mr. F. W. Porley scored for Cineraria stellata, but in this class the strain or selection of varieties was distinctly at fault, and there was not a really good plant in the competition. Mr. W. Pipe had the best mignonette in a close competition, and Mr. Burton staged the best lily of the valley.

Mrs. Gilbert, Carr Street, Ipswich, showed the best daffodil bouquet. Mrs. F. W. Judge, London Road, was first for a basket of daffodils with a fine arrangement of Emperor. Mrs. Owen Turner scored for a bowl of daffodils with Leedsi varieties, and also for the best vase of daffodils, with jonquils lightly disposed. For four bowls of spring flowers Miss Warnes, Bramford, led with a delightfully simple and pretty arrangement of daffodil Queen of Spain.

Non-competitive groups included a grand exhibit of flowering shrubs, etc., from Mr. R. C. Notcutt, Woodbridge; carnations from Messrs. W. Cutbush and Son, Highgate; daffodils from Messrs. R. H. Bath, Lim., Wisbech; and daffodils from Messrs. F. Smith and Co., Woodbridge.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, April 20.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Sir Daniel Morris, G.C.M.G., Professor Church, F.L.S., Messrs. A. Worsley, G. Massee, A. W. Hill, J. Douglas, C. Druery, J. T. Bennett-Poë, J. W. Odell, W. Cuthbertson, and F. J. Chittenden (hon. secretary).

INSECTS IN CINERARIA STEM.—Mr. G. S. Saunders reported that he had examined the plant of cineraria sent to the last meeting, and found that the stem had been hollowed out at the base for some distance by some grub, but what there was no evidence to show.

FATSIA INJURED BY GNAWING ANIMALS.—Mr. J. W. Odell reported that he had examined the plants of fatsia in the garden of Mr. Kingsmill, at Harrow Weald, who had sent specimens of the injured stems to be examined by the committee, and found that the injury had been caused by the long-tailed field mouse, which had gnawed off the bark of some of the branches all round for a considerable length.

DOUBLE AURICULA.—Mr. Druery called attention to a very double auricula of an exceedingly dark purple colour, shown by Mr. J. Douglas. The plant had been raised by Mr. C. B. Green, of Acton, from seed bought of Mr. Douglas, and the plants had been grown on by the latter. The example was particularly interesting, since Mr. Douglas stated that never before in his experience had a double auricula been raised from seed of his plants. Sir Daniel Morris raised the question of whether such a variation as this suddenly occurring from seed could rightly be called a sport. The discussion of the proper application of this term was deferred.

VARIOUS PLANTS.—Mr. Worsley showed flowers of Tulips which he had received under the name of Tulipa Fosteriana from Holland, and commented upon the amount of variation in colour which these showed, especially in the presence and absence of the dark blotch at the base of the perianth pieces. He considered that the plant approached very closely to Tulipa Eichleri. Mr. Worsley also offered some remarks upon a plant shown at the previous meeting, which he had identified as Urceolina miniata, a native of the Peruvian Andes.

From Mr. A. W. Sutton came an unnamed composite, apparently a native of Tropical Africa. In appearance the flowers somewhat resembled those of a cineraria, but did not seem identical with any known species. Mr. Sutton was asked to show the plant again when ripe fruit could also be seen.

Sir Daniel Morris remarked that he had recently seen, in a garden in the New Forest, a white-flowered shrub about 5ft. or 6ft. in height, which there passed under the name of Leucopogon Cunninghami, but which was really Spiræa Thunbergi. He desired to know whether Leucopogon Cunninghami was hardy in England.

MALFORMED ORCHIDS.—Mr. G. Wilson, F.L.S., sent two malformed cattleyas from the same spike, which had three outer perianth pieces, but the inner were reduced very greatly, the small lip springing from near the apex of the column instead of from the base. Three stamens were present.

Horticultural Club.

THE COLOURS OF PLANTS.

After the usual monthly dinner of this club at the Hotel Windsor, on the 20th instant, Mr, W. J. Jefferies taking the chair, Mr, A. E. Bunyard gave a most interesting lecture on the results of his research and experiments into the underlying causes of colour and change of colour in plants.

By means of a number of lantern slides, some representing flowers in their natural colours as obtained by up-to-date processes, and others representing prepared microscopic sections of the colour producing plant cells, he showed and explained the many subtle ways in which colours are widely varied by very minute modifications of the colouring matter, or even only of its arrangement. In the first place, he explained that we recognise colours by virtue of the varying powers possessed by the colouring materials of absorbing white light, i.e., sunlight, and breaking it up, as in prisms, into those constituent tints which we see in the rainbow or in the spectrum. When so broken up these components are partly absorbed and partly thrown off or reflected, and it is by virtue of the rejected rays, and not the absorbed ones that our eyes are affected, and we see the colour concerned. Inherently, therefore, what we call a red body is really all the tints but red, and not red at all in itself. He then went on to explain that the colouring matter in plants is of two kinds, sap or liquid colours, and "plastids" or minute microscopic bodies of a granular nature

In one very remarkable slide representing a section of a flower petal, he showed how these two kinds, say, one yellow the other red, may be associated in separate but adjoining cell layers in definite patches, and in such a fashion that when both were exactly superimposed, a very intense colour appeared; while otherwise, a less exact coincidence would allow the lighter tint to appear between the darker one, and in this way produce more or less marked gradations of tint by purely microscopic shifting of the layers. The skill which could have produced such a beautifully clear exemplification as a lantern slide, created a great impression when the delicacy of the operation was considered.

Mr. Bunyard next explained that the chief colouring matter of plants, viz., the chlorophyllic or green granules, which pervade the foliage, is almost always, if not invariably, associated with a yellow colouring matter termed carotin, from its presence as the colouring medium of the carrot. In foliage this is masked by the predominating green granules, but when these are withdrawn in the autumn, the yellow tint becomes visible, and, in conjunction with other media, produce the brilliant reds and yellows of the autumn landscape. Another interesting point brought out by the lecturer was the practical identity of blue and red colours, whether sap or pigmentary, from the fact that a slight excess of acid on the one hand, or alkali on the other, would determine either colour, the blue becoming red by acid reaction, and the red blue by alkaline, as in the familiar test cases by litmus paper, which, in point of fact, is stained with a vegetable colour to start with. Hence a very slight change in the composition of the soil or in the assimilative tendencies of the plant itself may lead to a change from red to blue flowers, or vice versa, as we see in the much-discussed cases of the hydrangea. A further series of slides illustrated very peculiar forms taken by colouring matter in the epidermal layers of fruits, the melon sometimes displaying under the microscope curious arrangements of rods and ribbons, while in other cases the matter takes the form of minute crystals. Flowers being modified leaves usually contain chlorophyll in their incipient stages, but eliminate it later as they assume their distinctive colours. In the green flowers, however, such as green roses and dahlias, this elimination does not occur; the chlorophyll persists, and in this way a partial reversion occurs.

An admirable feature of Mr. Bunyard's research, as was recognised by all present, is its eminently practical character, since a careful analysis of the colouring factors may well determine the effort of hybridisers and selective cultivators in the right direction when otherwise in ignorance, say, of the entire absence of a certain component character, they are striving to obtain the impossible by combining parents, neither of which possess it. He pointed out, too, that a colour which may be entirely absent in the flower may betray its presence in the plant's system elsewhere, and also that varieties, even when not in flower, may be recognised by such indications, as, for example, in the white lilac, the leaf-buds of which differ from those of the coloured lilacs by an absence of a tint in the foliage, which the latter invariably show.

In the subsequent discussion, in which Messrs. Druery, Cuthbertson, Pearson, Barr, Sanders, and Dr. Shillitoe took part, several other points were raised, to which Mr. Bunyard replied, Mr. Druery pointing out that the most wonderful colour was the chlorophyll, the tiny green grains of which constituted the one and only link between the vitality of all organic creation and the life-giving influence of the sun, by virtue of which they were enabled to transform inorganic materials into organic, and in this way provide the animal world, including man himself, with the essentials of existence.

A hearty vote of thanks was awarded to the lecturer in conclusion.

Winchester Gardeners' Association.

The above association spent a very pleasant evening on the 20th ult. in the Oddfellows' Hall, when an illustrated lecture on "French Gardening" was given by Mr. W. F. Giles, from Messrs. Sutton and Sons. Mr. W. Cardy presided. The lecturer fully described the whole process of French gardening from the preparation of the beds and soil, and the arrangement of the bell-glasses and frames, to the use of every inch of ground. Some splendid views of French gardens were thrown on the screen, and also of some English gardens worked successfully on the same system. Mr. Giles reminded his hearers that French gardening was not all profit; there was great outlay at first, and much labour and time had to be spent, so that it was not such a gold mine as some would lead us to believe. The French had at present the honour of being foremost at raising salads in the early part of the year, but the English gardener does not take second place in an all-round competition in the culture of vegetables. The Chairman proposed a vote of thanks to Mr. Giles for his able lecture.

Reading Gardeners' Association.

The final meeting of the spring session took place in the Abbey Hall on Monday, April 19, when there was a very large attendance. The president, Mr. Alderman F. B. Parfitt, occupied the chair. The evening was devoted to the following competitions, all the work being done in the room:

Five small vases of flowers, suitable for a breakfast table, arranged for effect; fifteen minutes allowed for arrangement. Open to head gardeners, single-handed gardeners, and foremen only. Result: First prize, H. Goodger; second prize, W. Butler; third prize, H. C. Loader.

Vase of flowers, arranged for effect; open to members; head gardeners, single-handed gardeners, and foremen excepted. Result: First prize, A. E. Bolton; second prize, H. Prince; third prize, S. Judd.

Bowl of flowers, arranged for effect; open to those who had never won a prize. Result: First prize, E. Webb; second prize, A. Francis; third prize, F. Goodger.

The judges were Messrs. T. Tunbridge, A. F. Bailey, and R. A. Hatton, and their work, owing to the closeness of the competitions, was particularly arduous.

This meeting had been selected for the annual hospital night, when members bring flowers, which are next day sent to the Royal Berkshire Hospital.

Over 100 bunches of flowers were brought in by the following contributors: Messrs. Turnham, T. Tunbridge, T. J. Powell, Neve, Clarke, Fry, Bailey, E. J. Dore, H. Wynn (Reading), T. Judd, J. Wynn, F. Townsend, D. Dore, Boxall, Gilbert, Dix, Loader, W. J. Townsend, Abraham, G. Carter, Toovey, Hinton, Cooper, Gardener, Durrant, Wilson, H. Goodger, etc. A collection on behalf of the funds of the above-mentioned excellent institution was made by the association's representative, Mr. F. W. Exler. The sum of £3 1s. being realised.

On the proposal of Mr. Tunbridge, seconded by Mr. Exler, Mr. G. Hinton, one of the "fathers" of the association, was elected a life member of the society. Votes of thanks were accorded to Messrs. Watson and Son, Minster Street, for kindly lending vases and bowls; to Mr. J. Phillips, for the use of the tables; to the judges, and to the president. Two new members were elected.

Bournemouth Gardeners' Association.

In connection with this association the annual exhibition of cut blooms of spring-flowering plants (not shrubs) was held on Tuesday, April 20. There was a very good entry, and the vases of flowers staged made a brilliant display.

For six vases of hardy spring flowers, distinct, with their own foliage. Mr. Tompkins was first with a nicely-set-up collection. Narcissus Empress, Ornithogalum nutans (very early), crown imperial, Orobus vernus, N. Barri conspicuus, and Tulip La Reine were all fine vases of flowers. Mr. Nippard, gardener to Mr. Norton, Ashton Court Gardens, took second honours with a very beautiful lot of flowers. His tulips, polyanthuses, narcissi, and wallflowers were charming, and showed good culture. In the class for three vases of hardy spring flowers (not shrubs) Mr. Lansley was successful with a splendid exhibit. Narcissus Emperor, Tulip Keizerskroon, and polyanthuses were the kinds staged. Mr. Sprackling worthily won second prize with a bright trio of narcissus, hyacinths, and tulips, Mr. Pearce following closely for third position with a very fine exhibit.

Exhibitions such as this deserve every encouragement. They are intensely interesting, and highly instructive. After the prizes had been awarded Mr. Nippard, of Ashton Court Gardens, read a paper before a large and appreciative audience, on "Flowering Trees and Shrubs." He brought some grand specimens of rhododendrons, magnolias, pyrus, deutzias, and Forsythia Fortunei. Mr. Nippard referred to many kinds of flowering shrubs which were not really hardy in this country, except in mild seasons and in sheltered positions, such as are to be found in some parts of Bournemouth, and instanced Sir John Llewelyn's garden in Cornwall. The lecturer laid much stress upon the fact that flowering trees and shrubs were generally planted too thickly, and soon formed a dense growth like a forest, and then the hard pruning necessary resulted in the cutting away of much flowering wood, and other branches did not ripen sufficiently to bear flowers satisfactorily. He also deprecated the planting of conifers amongst flowering trees and shrubs. In mild districts, Mr. Nippard said, rhododendrons might be had in bloom nearly six months of the year. Daphnes, Choisya ternata, Andromeda floribunda, almonds, double-flowered pink peaches, which, he said, generally commenced to fruit with him after they had been planted five years. The fruits were not of much value for eating, but were excellent for stewing purposes. Prunus Pissardi was recommended to be grown as a standard; P. atropurpurea, and P. coccinea were also highly favoured. Double-flowered cherries were also dealt with, the lecturer advising that Cerasus grandiflora should be grown on a single stem as a standard, as dwarf plants spread over the ground too much. He also recommended lilacs being worked on privet, as the shoots were more short-jointed, and suckers never gave trouble.

Wistarias, weigelas, viburnums, shrubby spiraeas, laburnums, azaleas, cotoneasters, and numerous other kinds were very ably dealt with by the lecturer, who also answered many questions on pruning and other matters connected with the successful growing of these useful and ornamental flowering trees and shrubs.

Hearty votes of thanks to Mr. Nippard, and to Mr. George Garner, who presided, brought to a close a very pleasant meeting.

Bristol Gardeners' Association.

The annual meeting was held on Thursday, April 22, at St. John's Parish Rooms, when Mr. A. O. Shelton presided over an enthusiastic attendance. Mr. Scott read the annual report, followed by the financial statement, both of which were most satisfactory. Numerically and financially, the society is in a more favourable position than in previous years. A vote of thanks to the officers was proposed by Mr. E. T. Parker, and seconded by Mr. Binfield. Colonel Carey-Batten was again elected president, and thanked for his interest and help. Mr. Shaddick (gardener to Colonel Goss) was elected chairman, and Mr. Hayball (gardener to the Lord Mayor) as vice-chairman; Messrs. J. Scott and H. Woodward were re-elected treasurer and hon. secretary, and assistant secretary respectively; librarian, Mr. Coombes; registrar, Mr. Extense. The following were elected on the committee: Messrs. Holt, Perry, House, Lee, Binfield, Morse, Curtis, Shelton, E. T. Par-

IMPORTANT
TO
GARDENERS
AND
FRUIT GROWERS.

'NIQUAS'

(REGISTERED).

The most successful Non-poisonous Insecticide of the day.

ITS ADVANTAGES ARE—

Certain Death to all Insect Pests.
No possible injury to the most delicate Plant, Flower, or Foliage.
It is by far the Cheapest Insecticide known. One pint makes 10 to 12 gallons for Thrip, Black and Green Fly, etc., whilst RED SPIDER, Mealy Bug, and Scale can be thoroughly eradicated by using "NIQUAS" about double the strength required for Fly.

It is most successfully used by Orange and other Fruit Growers in the Colonies, etc.

PRICES:—Pint, 1/-; Quart, 1/9; ½-Gal., 3/-; Gal., 5/-; Kegs, each, 5 gals., 22/6; 10 gals., 42/6.

Ask for Testimonials, of which some hundreds have been received.

Specimen Testimonial.

From Mr. E. HUBBARD, Gardener to G. Hanbury, Esq., Blythewood, Burnham, Bucks, May 15th, 1906.
"I have been using your '**NIQUAS**' **Insecticide** for some years, and can with all confidence say it is the best I have ever used for Bug, Thrip, Red Spider, American Blight, and for all Insect Pests it has no equal. Also for the destruction of Maggots in Marguerites by dipping. I have recommended it to my friends generally."

TO BE HAD FROM ALL SEEDSMEN AND FLORISTS.

A good fresh start was made by electing six new members, and Mr. E. T. Parker kindly offered a silver medal for the most successful exhibitor during the coming session. For six vases of daffodils (prizes kindly given by Mr. C. H. Cave) there was a keen competition, the prizes going to Messrs. Holt, Woodward, and Binfield (in the order given), gardeners respectively to Mrs. Baker, Mr. Edgar Watts, and Mr. Francis Tagart. Ordinary certificates were awarded to Messrs. Garnish and Hayball, the former for a nice dish of Early Giant pea, the latter for daffodils and amaryllis.

ANSWERS TO CORRESPONDENTS.

DISEASED PELARGONIUMS. — W. F., Wymondham: The plants are suffering from an excess of moisture in the soil, and, probably also from the evils of a high temperature. The majority of the roots have rotted away as the result of overwatering, and the thin pale leaves indicate a high temperature. Let the soil become fairly dry, and gradually inure the plants to cooler conditions; by this means you may save some.

SEEDLING CARNATION. — R. B. M., Sale: We are sorry to disappoint you, but it would be next to useless to attempt to place the variety on the market. The colour is good, but the flower lacks size and substance, and, what is of more importance than those, it has a bad, splitting calyx. Not one flower of those sent had an entire calyx. The prizes are few, but if this discouragement urges you to further efforts, and to higher aims as a raiser, it will have served its purpose.

SWEET PEAS.—M. M., Hellifield: We advise you to do two things, viz., secure a copy of "Sweet Peas and Their Cultivation," price 1s. 2d. (or 1s. 8d. in cloth), from Messrs. W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.; and then join the National Sweet Pea Society, the secretary of which is Mr. C. H. Curtis, Adelaide Road, Brentford, Middlesex. The teaching in the book we recommend will assist you to grow flowers sufficiently well to win prizes at the National Shows at Saltaire or London next July.

AMERICAN BLIGHT.—R. M., Sandown: Cut away and burn all the badly-infested and cankered growths, and then paint the branches with spirits of wine, but do not touch the new growths with it.

FELLOWSHIP OF THE R.H.S.—A. H., Croydon: Send to the Secretary of the Royal Horticultural Society, Vincent Square, Westminster, for a form of application for fellowship. When you receive this get some Fellows of the society to propose and second the nomination, and return the filled-up form, together with a cheque for 21s., to the society's offices, as above. If you are not well acquainted with any Fellows, the Council will see that your application form is duly filled up. Ladies are entitled to become Fellows of the society.

LOGANBERRY. — A. H. J., Whitehaven: To secure a lot of strong canes for next season's fruiting, and to enable the plant to become fully established, cut down the canes quite close to the ground, reserving one or two for layering. The layering should be done at once, and if a few "tongues" are cut near the joints along the cane, roots will the more readily form.

BIG BUDS ON BLACK CURRANTS.—G., Erdington: The big buds are caused by an infestation of the Currant Bud Mite (Eriophyes ribis), and should be all pulled off and burned at once. You will see, on page 328 of our issue for April 24, an answer to a similar question to yours, and there a course of procedure is advised for keeping this microscopic pest in check. Another method is to spray the black currant bushes every ten days from the end of April to the end of June, with a mixture of quassia, soft-soap and water, boiling the quassia chips in water for an hour or so, and adding the soft soap to the hot solution before straining. The proportions should be a quarter-pound of quassia and two ounces of soft soap for each gallon of water.

DEAD SHOOTS OF EUONYMUS LATIFOLIUS.—B. P., Harrow: In a great many gardens the green and variegated euonymuses have suffered terribly as a result of the winter just passed, or rather as a result of very cold weather following a warm, moist autumn. The latter rendered the growths soft and succulent, so that they could not withstand the subsequent hard weather. If you carefully examine the bushes you will probably find that buds are pushing from the hard old wood, below the dead upper shoots, and if this is so, you should leave the bushes alone for another few weeks, and then cut the dead growth back to the new shoots.

LYCASTE (BIFRENARIA) INODORA.—G. W. D., Leatherhead: This species and other members of the genus are best suited in an intermediate house, and need practically the same treatment as the lycastes. B. inodora does well in a basket suspended from the roof. Water freely during the growing season, but be careful of overwatering at other times. You should also try L. Harrisonæ.

BIRDS AND CULINARY PEAS. — S. B. W., Wendover: We have not yet found a better means of keeping birds from young pea plants than the use of black cotton, or coarse black thread. Three rows of cotton, stretched over the rows, about four or six inches above the ground, and knotted to short sticks at each end and in the middle of the rows, will suffice, and birds will rarely touch the plants under it, while a strong plant outside the guarding cotton will be soon spoiled. We ourselves use tacking cotton, which costs 2d. or 2½d. per thousand yards, so that the protection given can hardly be regarded as expensive. We have to protect early lettuces in a somewhat similar way. Ten days ago a neighbour lost all his lettuces within an hour of planting them, because he had no cotton at hand to protect them with.

HELLEBORE POWDER. — G., Erdington: Hellebore powder is very poisonous, and its chief use in gardens is to combat attacks of the Gooseberry Sawfly on gooseberries and red currants. It is dusted over the bushes and among the foliage when the latter is moist with dew, or has been moistened by syringing. A flour dredger, with fine holes, is a useful implement for distributing the powder. Unless heavy rains follow soon after an application it is dangerous to pick green gooseberries from bushes that have been treated, but if the berries are left to ripen, there will be no fear of harm, as one or two dressings of hellebore powder will usually suffice in late spring or early summer. Do not inhale the powder, and take care that a careful man uses it.

NAMES OF PLANTS.

G. W. D., Leatherhead.—Lycaste (Bifrenaria) inodora.

J. J., Compton Abdale.—1, Forsythia viridissima; 2, Prunus Pissardi.

W. W., Gerrard's Cross.—Anemone fulgens—surely we named this for you a week ago!

P. V. O., Weeley.—We regret we cannot name varieties of florists' flowers. Probably the soil is unsuitable for the Campanelle Jonquil, hence its irregularity.

J. H., Pontypool.—The orchid is Lycaste (Bifrenaria) Harrisonæ. The begonias are, apparently, B. manicata (1) and B. fuchsioides (2), but a leaf or piece of growth would have enabled us better to determine the species.

C. R., Wuntorse. — The flowers were shrivelled up in their packing of cotton wool, and quite beyond identification. We cannot promise to name florists' flowers, and you had much better send flowers of daffodils to a specialist for name.

FORTHCOMING ENGAGEMENTS.

MONDAY, May 3.—National Fruit Growers' Federation.

TUESDAY, May 4.—Royal Horticultural Society; Narcissus and Tulip Committee meets at 11.30; Fruit, Floral, and Orchid Committees at 12 o'clock; lecture at 3 p.m. by Mr. C. C. Hurst, on "Mendel's Law and its Application to Horticulture"; Scientific Committee at 4 o'clock.

WEDNESDAY, May 5.—National Auricula and Primula Society, Midland section, at Birmingham, two days.

THURSDAY, May 6.—Royal Gardeners' Orphan Fund Festival Dinner at the Hotel Cecil.

DANYSZ VIRUS is not a Poison, but DESTROYS

RATS & MICE

Harmless to Human Beings, Domestic & other Animals, &c.
Single Tube, 2/-; Three Tubes, 5/-; Post Free from—
DANYSZ VIRUS, Ltd., Box 474,

NEW BOOKS.

LAWNS AND GREENS.

By T. W. Sanders, F.L.S. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.). Price 1s. net., by post 1s. 2d.; bound in cloth, 1s. 6d., by post 1s. 9d.

The appearance of this book is of special interest to us, as a further proof that the free expression of our views with regard to the importance of a well-made and properly-kept lawn has had the desired effect. For a long period the lawn was relegated to a quite unimportant position in garden literature, and it was quite exceptional to meet with other than the briefest reference to it, except in works of a comprehensive character. Knowing how greatly does bright green velvety turf contribute to the enjoyment of the flower garden and pleasure grounds, we have for some years constantly kept before our readers the necessity of paying such attention to the lawn as will ensure it being at all times in the best possible condition. We have been careful to give prominence to the importance of keeping the grass free from weeds, and of maintaining the soil in a proper state of fertility. We are glad to have evidence that, as the result of our endeavour, a considerable improvement has been effected in the management of lawns, and that a strong demand has arisen for the fullest information on the various details essential to success.

If we derive satisfaction from the great quickening of interest in the lawn and its management, the feeling is materially enhanced by the knowledge that the book before us is so full and trustworthy as to be admirably adapted to the needs of those who are desirous of becoming fully informed on all that relates to the lawn and its management. The book is divided into four parts, and in the first the formation of lawns is fully dealt with. The second part is devoted to the management of lawns, and here we find ample information on mowing, rolling, watering, renovating, manuring, and weeds and pests. In the third part tennis and croquet lawns, bowling greens, cricket grounds, and golf greens are fully described, and the details of their formation and management referred to with sufficient fulness to enable the reader to carry them out without difficulty. The fourth part is devoted to the various appliances necessary in the making and keeping of the lawn. The book is freely illustrated, and, while all are good, the illustrations of garden weeds, from photographs taken by Mr. H. A. Smith, must have special mention.

THE ROSE ANNUAL FOR 1909.

Although somewhat late in making its appearance, this publication of the National Rose Society will be heartily welcomed by the large body of members, and, indeed, by not a few rosarians who have not as yet participated in the advantages resulting from association with this important body. The more noteworthy of the contributions to the issue include an account of the society's exhibition in 1908 by Mr. E. B. Lindsell; a descriptive list of the roses to which the Nickerson awards were made, by Mr. Herbert E. Molyneux; rose hybridisation, by Mr. Alex. Dickson; Wichuraiana roses, by Dr. A. H. Williams, climbing roses, by Mr. H. R. Darlington; a descriptive list of some of the newer roses that appear to be the most worthy of the attention of cultivators; and Banksian roses, by Mr. George Gordon, V.M.H.

With regard to the usefulness of the contributions as a whole, there can be no doubt; but several are of so great a length as to prevent the pages presenting that attractive appearance one could wish. The illustrations are numerous, and conspicuous among them are the portrait of the Rev. F. Page-Roberts, the president of the society, and the views in the Strathsfieldsaye Rectory garden, and the portrait of Mr. W. E. Nickerson, who last year generously presented twelve silver cups to the society.

NOW IS THE TIME TO PLANT.
KELWAY'S CELEBRATED GLADIOLI
for the most beautiful effect in beds, and for groups and lines in borders, from July throughout the autumn.

Plant beds and groups of a colour. Or for special beds near the house, or for exhibition use, choice exhibition kinds as below:—

Fine sorts for grouping, flowering bulbs, 15/- to 21/- 100.
Choice named varieties, Collection "2," 34/- per 100.
" " " " "4," 7/6 per doz.
" " " " "6," 12/- " "
" " " " "8," 27/- " "
KELWAY and SON, Langport, Somerset.

GOLD OF THE GARDEN.
NOW IS THE TIME TO PLANT
Herbaceous Plants generally, but especially
KELWAY'S GOLDEN GAILLARDIAS.
Kelway's Gaillardias should be in every garden. The striking effect of their glorious golden and ruddy copper-coloured blooms cannot be obtained with any other plants. Insist on Kelway's, the most improved Gaillardias in the World.
Collection "B," 12/- per doz.
" "C," 18/- " "
Kelway's best named varieties.
KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

NOW IS THE TIME TO PLANT KELWAY'S PYRETHRUMS. Perfectly hardy, flowering in grand profusion, and lasting long in fresh beauty, they are invaluable for a constant supply of cut flowers. Kelway's new single-flowered kinds are particularly recommended. Strong plants are sent on receipt of order as follows: Kelway's choice named kinds, Collection "B," 12s. doz.; Collection "C," 21s. doz. Everything free for remittance with order. KELWAY and SON, The Royal Horticulturists, Langport, Somerset.

GOOD OLD FLOWERS.—Double White Rocket, 9s. per doz.; white and coloured Pinks, strong, pots, 21s. per 100; "Rob Roy" Crimson, and "Alice" Pink Daisies, 16s. per 100; Monstrous White, 6s. per dozen; package free. GEO. BUNYARD and CO., LTD., Maidstone.

COOPS, COOPS, FOR SEASON 1909. Only best material and workmanship.
Send for New List.
BOULTON and PAUL, Ltd., Dept. M5, Norwich.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Beauty of the Orchard.

Although the owners of orchards are naturally more concerned at the present time with the prospect of the harvest that will follow the wealth of bloom that the fruit trees are now yielding, than with the beautiful effects the blossom-laden trees are now producing, the great beauty of the orchard should not be overlooked. We can fully appreciate the feelings of those who cultivate hardy fruits on a large scale for market purposes as they watch the changes in the weather that follow each other in quick succession; but we feel that growers, as well as those who are not immediately concerned with crop prospects, should derive as much pleasure as possible from the exquisitely beautiful effects that well-managed fruit trees are so well able to produce during their season of flowering. An ancient apple tree, with gnarled stem, lichen-covered branches, and comparatively few clusters of flowers, will probably appeal more strongly to the artist than the trim and lusty occupants of the commercial fruit plantations; yet the latter, when enwreathed in blossom, are so attractive as to at once appeal to the great body of flower lovers, and especially to those who derive greater pleasure from natural objects in their full vigour than from those that have passed their period of usefulness, and are showing unmistakeable signs of decay. We have recently had opportunities for passing through some of the principal fruit-growing districts, and have been much impressed by the great billowy masses of snow-white blossoms produced by plum, pear, and cherry trees. We have also been much gratified by the promise that is now being given in garden and orchard of an abundant yield. Plum trees have, in most districts, flowered freely, and would appear to be setting well, and especially in orchards that are provided with a screen on the northern and eastern sides sufficient to break the force of the cold winds that come from these directions, and frequently do much injury to the reproductive organs of the flowers and the embryo fruits when the trees are exposed to their full effects. Even more profusely are the pear trees flowering, but, unfortunately, flower production is, in the case of the pears, coincident with a material reduction in the temperature, and it is not surprising that owners of pear orchards should at the present time be apprehensive as to the ultimate results. Pears are the most uncertain of orchard fruits, because of the extreme susceptibility of the reproductive organs to frost, and, indeed, to temperatures closely approaching frosty conditions; but the flowers have developed in a most satisfactory manner, and, we trust, both in the interest of growers and consumers, that a good crop will in due course be gathered. In gardens where the trees are trained to walls, or grown in pyramidal or bush form, and the means are available for protecting the trees until the young fruits are safe from frost, the results will probably be satisfactory. There is at present the prospect of a good crop of pears, but not until we have passed the cold spell that is usually experienced about the 20th of this month will it be possible to make a forecast worthy of attention. Very abundant also is the bloom of the cherry trees, and where these fruits are grown largely, as in Kent and a few other counties, they now contribute liberally to the attractions of the landscape. Geans, bigarreaus, and morellos are equally profuse in flowering, and the blossoms are strong; favourable weather alone is necessary to ensure an abundant crop. It is a matter of some interest that the cultivation of cherries for market should not have been increased to a greater extent outside the county of Kent than has been the case. Cherries are unquestionably peculiar in their requirements, and no one who possesses ordinary intelligence would plant cherries where the natural conditions are not favourable to their growth. There are, however, many districts in which soil and climatic conditions are eminently favourable to these fruits, where no trees have been planted, except in gardens for the production of fruit for home use. We know of numerous sites for cherry orchards in the home counties, and the other day, in passing through a wide-spreading village in Hampshire, where farmhouses, villas, and cottages were literally smothered in huge cherry trees, we were not able to find a single orchard of these fruits that had been planted for commercial purposes. The absence of orchards from a district eminently fitted to cherry culture was all the more remarkable from the fact that it was within a short distance of two great populous centres. The flowers of the apple trees are as yet safely enclosed in the buds, and as they are abundant, as well as late in development, we may, at the present time, look forward with a feeling of hopefulness to the ingathering of the fruit harvest. The lateness of the flower development of apples is not by any means an assurance of a full crop, but it is an important factor, inasmuch as the shorter the period previous to the last week in May the flowers and young fruits are exposed to

SIR JOSEPH DALTON HOOKER, C.B., G.C.S.I., K.C.S.I., F.R.S., Etc.

climatic influences, the smaller is the risk of damage from frost. Bush fruits are very promising, and the flower trusses of strawberries appear to be of exceptional strength, and the earlier flowering varieties of the last-named will pay for a light protection, as frequently advised in these pages.

Sir Joseph Dalton Hooker, C.B., G.C.S.I., K.C.S.I., F.R.S., etc., etc., whose portrait we have very great pleasure in presenting to our readers, is the Grand Old Man in the world of botanical science. He was born in 1817, the second son of Sir William J. Hooker, and he practised as a surgeon in the Royal Navy for many years, being attached to the Antarctic Expedition in the "Erebus," in 1839-43. During 1847-51 he travelled as a naturalist in the Himalaya, Eastern Bengal, and the Khasia Mountains, discovering very many notable plants that now enrich our gardens and greenhouses. He visited Syria in 1860, Morocco in 1871, and California in 1877. It was in 1855 he was appointed Assistant Director of the Royal Gardens, Kew, and in 1865 he succeeded his father as Director, a position he held with great ability until he retired in 1885. Sir Joseph Hooker was president of the Royal Society from 1872 to 1877, and during the greater part of his life he has been associated with the work of the Royal Horticultural Society, and still is chairman of that body's Scientific Committee. Sir Joseph Hooker's "Himalayan Journal," a vastly interesting record of travel and discovery, will be familiar to most of our readers; other publications of his include "The Flora of British India," "Handbook of the New Zealand Flora," "Students' Flora of the British Isles," and "The Rhododendrons of the Sikkim Himalaya." For many years Sir Joseph Hooker edited the "Botanical Magazines," but a mere mention of his literary work would fill several of our columns. Despite his age, he still takes the keenest interest in botanical science at his pleasant home at Sunningdale.

Tradescant's Tomb.—Mr. A. D. Webster writes: "In Lambeth Churchyard is a tomb which no botanist should neglect visiting that of John Tradescant, who was gardener to Charles I. in 1629. Near by was his famous botanical garden, in which, as late as 1749, might have been seen many rare and curious plants, including the arbutus, aristolochia, and Rhamnus catharticus, the latter about 20 feet high, and nearly a foot in diameter of stem—truly a giant specimen of our native buckthorn. It was, indeed, hard to realise when visiting the adjoining Lambeth Borough Recreation Ground, with its soot-incrusted specimens of the euonymus, holly, and aucuba, where the atmosphere reeks with chemical fumes, that little more than a century and a-half ago nearly the same site should have been occupied by the most famous botanical garden and museum of its day."

Fixation of Nitrogen.—The next meeting of the London branch of the British Gardeners' Association takes place on Thursday, May 13, at Carr's Restaurant (Charles Dickens' Room), Strand, W.C., when Professor W. B. Bottomley, M.A., of King's College, will give a lecture, illustrated by lantern slides, on "Nitrogen Fixation in Plants." Many of the leading horticulturists are expected to be present. Professional gardeners interested in this subject should take advantage of this opportunity to hear Professor Bottomley.

Proposed Garden Belt for Paris.—In an official report recently presented to the Parisian authorities, there is a strong recommendation that the old fortifications which surround the city be converted into a continuous garden. If this recommendation is adopted Paris will presently have a nineteen mile long belt of gardens, averaging about 250 yards in width. It is estimated that the net cost of the conversion will be about equal to £5,000,000, and the upkeep will cost well over £100,000 a year.

Beautiful Violas and Pansies.—Wondrously beautiful are the violas, and, to some folk, the pansies, with their splendid markings, are even more beautiful. It is in spring and early summer we so greatly prize these homely flowers, but they must be well grown if we are to have them at their best. From Messrs. Dobbie and Co., Rothesay, we have received a gathering of these flowers that in size, substance, and brilliance leave nothing to be desired. Among the violas we were specially pleased with Crieffie Smith, deep blue; John Cunningham, claret; Agnes Kay, lavender; Hugh Reid, plum; Jenny McGregor, violet; Miss H. Pearce, white; and Mrs. C. W. McPhail, purplish-lavender, while among the pansies notably fine things were Mrs. MacFadyen, gold and purple; James Johnstone, two shades of claret-purple; W. P. A. Smith, yellow and purple; Margaret Fyfe, blue and pale yellow; Mrs. H. Stuart, maroon and rose; Peggie Townsend, blue and cream; and Jenny Morris, yellow blotched with maroon. Many of the violas were sweetly scented, and all the flowers had good stems, giving evidence of good selection and fine culture.

Longleat, the residence of the Marquis of Bath, at which the Prince and Princess of Wales will stay on the occasion of their visit to Midsomer Norton in June next, is very properly regarded as one of the largest and most beautiful mansions that were erected in the sixteenth century. The foundation of the present mansion was laid by Sir John Thynne, in 1566, from designs by John of Padua, and the house, so far as finished by Sir J. Thynne, was twelve years in building. Sir James Thynne, a later owner, completed the work. The present garden front is of much later date, and is due to Sir J. Wyatville, who remodelled the principal apartments. As indicating the vast proportions of the palatial structure, the length of the main front is 220 feet, and of the flanks 180 feet. During the long period over which the history of Longleat extends the gardens have shown considerable variation in style. For a considerable period they represented the formal Dutch style at its best, but the third Viscount Weymouth, created Marquis of Bath, had the gardens and pleasure grounds remodelled under the direction of "Capability" Brown. The stately mansion is approached from the south by a straight drive a mile or so in length, flanked by old elms, and for some distance bounded on one side by the pleasure grounds, and on the other by the large lake. The woods and plantations have an area of about 2,000 acres, and the magnificent park affords a large number of views of great beauty, the most noteworthy being that from the spot known as Heaven's Gate.

New Public Gardens for Douglas.—The Douglas Town Council have accepted the offer of the trustees under the will of the late Mr. Henry Bloom Noble, to sell them the Villa Marina, Douglas, for £60,000, a condition being that the grounds shall be used as public gardens. The trustees will return to the Council £20,000 for the erection of a public hall in the grounds, and will set aside £50,000 for agricultural and industrial education.

Great American Orchid Exhibition.—A large exhibition of orchids is being arranged for May 26 to May 30, [illegible], by the Massachusetts Horticultural Society. There will be also classes for new stove and greenhouse plants, new conifers, and shrubs, and new herbaceous plants. [illegible] gold medals will be offered as prizes, and in some instances substantial money prizes are to be added to the medal award. Full particulars and schedules can be obtained from Mr. William P. Rich, the secretary of the society, Boston, Mass., U.S.A.

The Worshipful Company of Gardeners, on the occasion of a banquet given recently at the Gaiety Restaurant, London, was honoured by the presence of the Duke and Duchess of Teck, and the Freedom of the company was conferred upon his Serene Highness. Captain R. I. Tasker presided over a large company that included Sir Trevor and Lady Lawrence, Sir Albert K. Rollit, Mr. N. N. Sherwood, Mr. C. Bayer, and other well-known horticulturists.

Wild Flower Show at Glasgow.—So successful was the exhibition of wild flowers held last year in the People's Palace, Glasgow Green, that the display is to be repeated this year. The daily exhibition of wild flowers has already commenced, and will be continued until the end of September, and it is proposed, in connection therewith, to give simple botanical lessons to the young Glaswegians.

Presentation to Mr. J. H. Goodacre.—As an acknowledgment of the good work he has done for the members during many years, by advice, visits to gardens, and lectures, the Nottingham Garden Holders' Society, presented Mr. J. H. Goodacre with a fine silver salver a few days ago. The presentation was made by Councillor Small, at a public meeting at the Welbeck Hotel, Nottingham. As our readers are probably well aware, Mr. Goodacre is head gardener to the Earl of Harrington, at Elvaston Castle, and is a famous fruit grower and exhibitor.

Fire on Hockley Common, Elstead.—The lads who were charged with setting fire to the furze, etc., on Hockley Common, were recently brought before the Guildford County Bench, and committed for trial at the Assizes.

Alteration of Walks at Kew.—The fence which for fifty years had separated the "Botanical Garden" from the "Pleasure Grounds" or Arboretum was removed in 1895. A path on each side of it had been necessary so long as the two sections of Kew remained distinct, but when the fence was taken down these two walks, where they ran parallel and within a few yards of each other, lost their meaning, except that one was used as a service road for carts, etc. From the landscape point of view, also, this duplication of walks was wrong. During the past winter that section of the service road reaching from near the Victoria Gate to the point where it joined the road leading to the Stable Yard has been broken up, and will disappear. The path for visitors which went behind the Temple of Bellona and ended at the Unicorn Gate has been brought in front of the Temple, and now ends close to the Victoria Gate. It may be of interest to mention, says the "Kew Bulletin," that this path is a portion of the ancient "Stafford Walk," made, so tradition says, by the Staffordshire [illegible] about 1770. It commenced at the [illegible] end of the Rhododendron Dell, passed through the "Hollow Walk Wood" [illegible] the Sion Vista, and ended, as already stated, where the Unicorn Gate now stands.

VEGETABLE MARROWS.

These succulent vegetables are often relegated to an inferior place among crops, and the reason is not far to seek. Each marrow is allowed to grow too much, or it is grown too slowly, and then it has to be peeled and seeded, so that by the time it is cooked, most of its flavour, as well as its nutritive properties, have been transferred to the water. People, too, sometimes scoff at it because it contains 94 to 95 per cent. of water, and to such we might reply that some light beers contain about the same proportion. Students of physiology tell us that we should consume at least five pounds of water every day in some form or other, and a certain school of doctors are favouring the practice of taking this liquid in the form of food rather than of drink. Given a well-grown marrow of good variety, cut at the right time, that is, from five to ten days from the bloom in fairly warm weather, and cooked whole, and I am of opinion that it is worthy to hold a place not far below green peas and asparagus. But no hotel, or dining place of any sort, to which I have been, has ever given it to me in this way. As one gets it at these places, it is truly only a third-rate vegetable.

Two main opinions, diametrically opposed to each other, are held as to the proper cultivation of the vegetable marrow. One school of gardeners dissuades us from making a special bed for it, and tells us to grow it on the level in ordinary deeply-dug and well-manured soil—in ordinary market-garden style, in fact—claiming that by this system it is more fruitful, and continues bearing till later in the season. I do not deny there may be something in this, though, as I have had them bearing from early July till late October on the raised-bed system, and have cut as many as seventy-three marrows from a bed containing three plants, I cannot believe there is much in the claim of increased fertility and lengthened season when grown on the flat without any special preparation. But one undoubted feature of the latter system is that the fruits do not swell up so quickly, and therefore have to be cut when smaller, not only to avoid the necessity of peeling and seeding, but also to secure that delicate marrow flavour, added to which one does not get them, as a rule, until a month later in the season, there being a difference between having cold garden soil below them in late May, and the warmth of a considerable mass of manure.

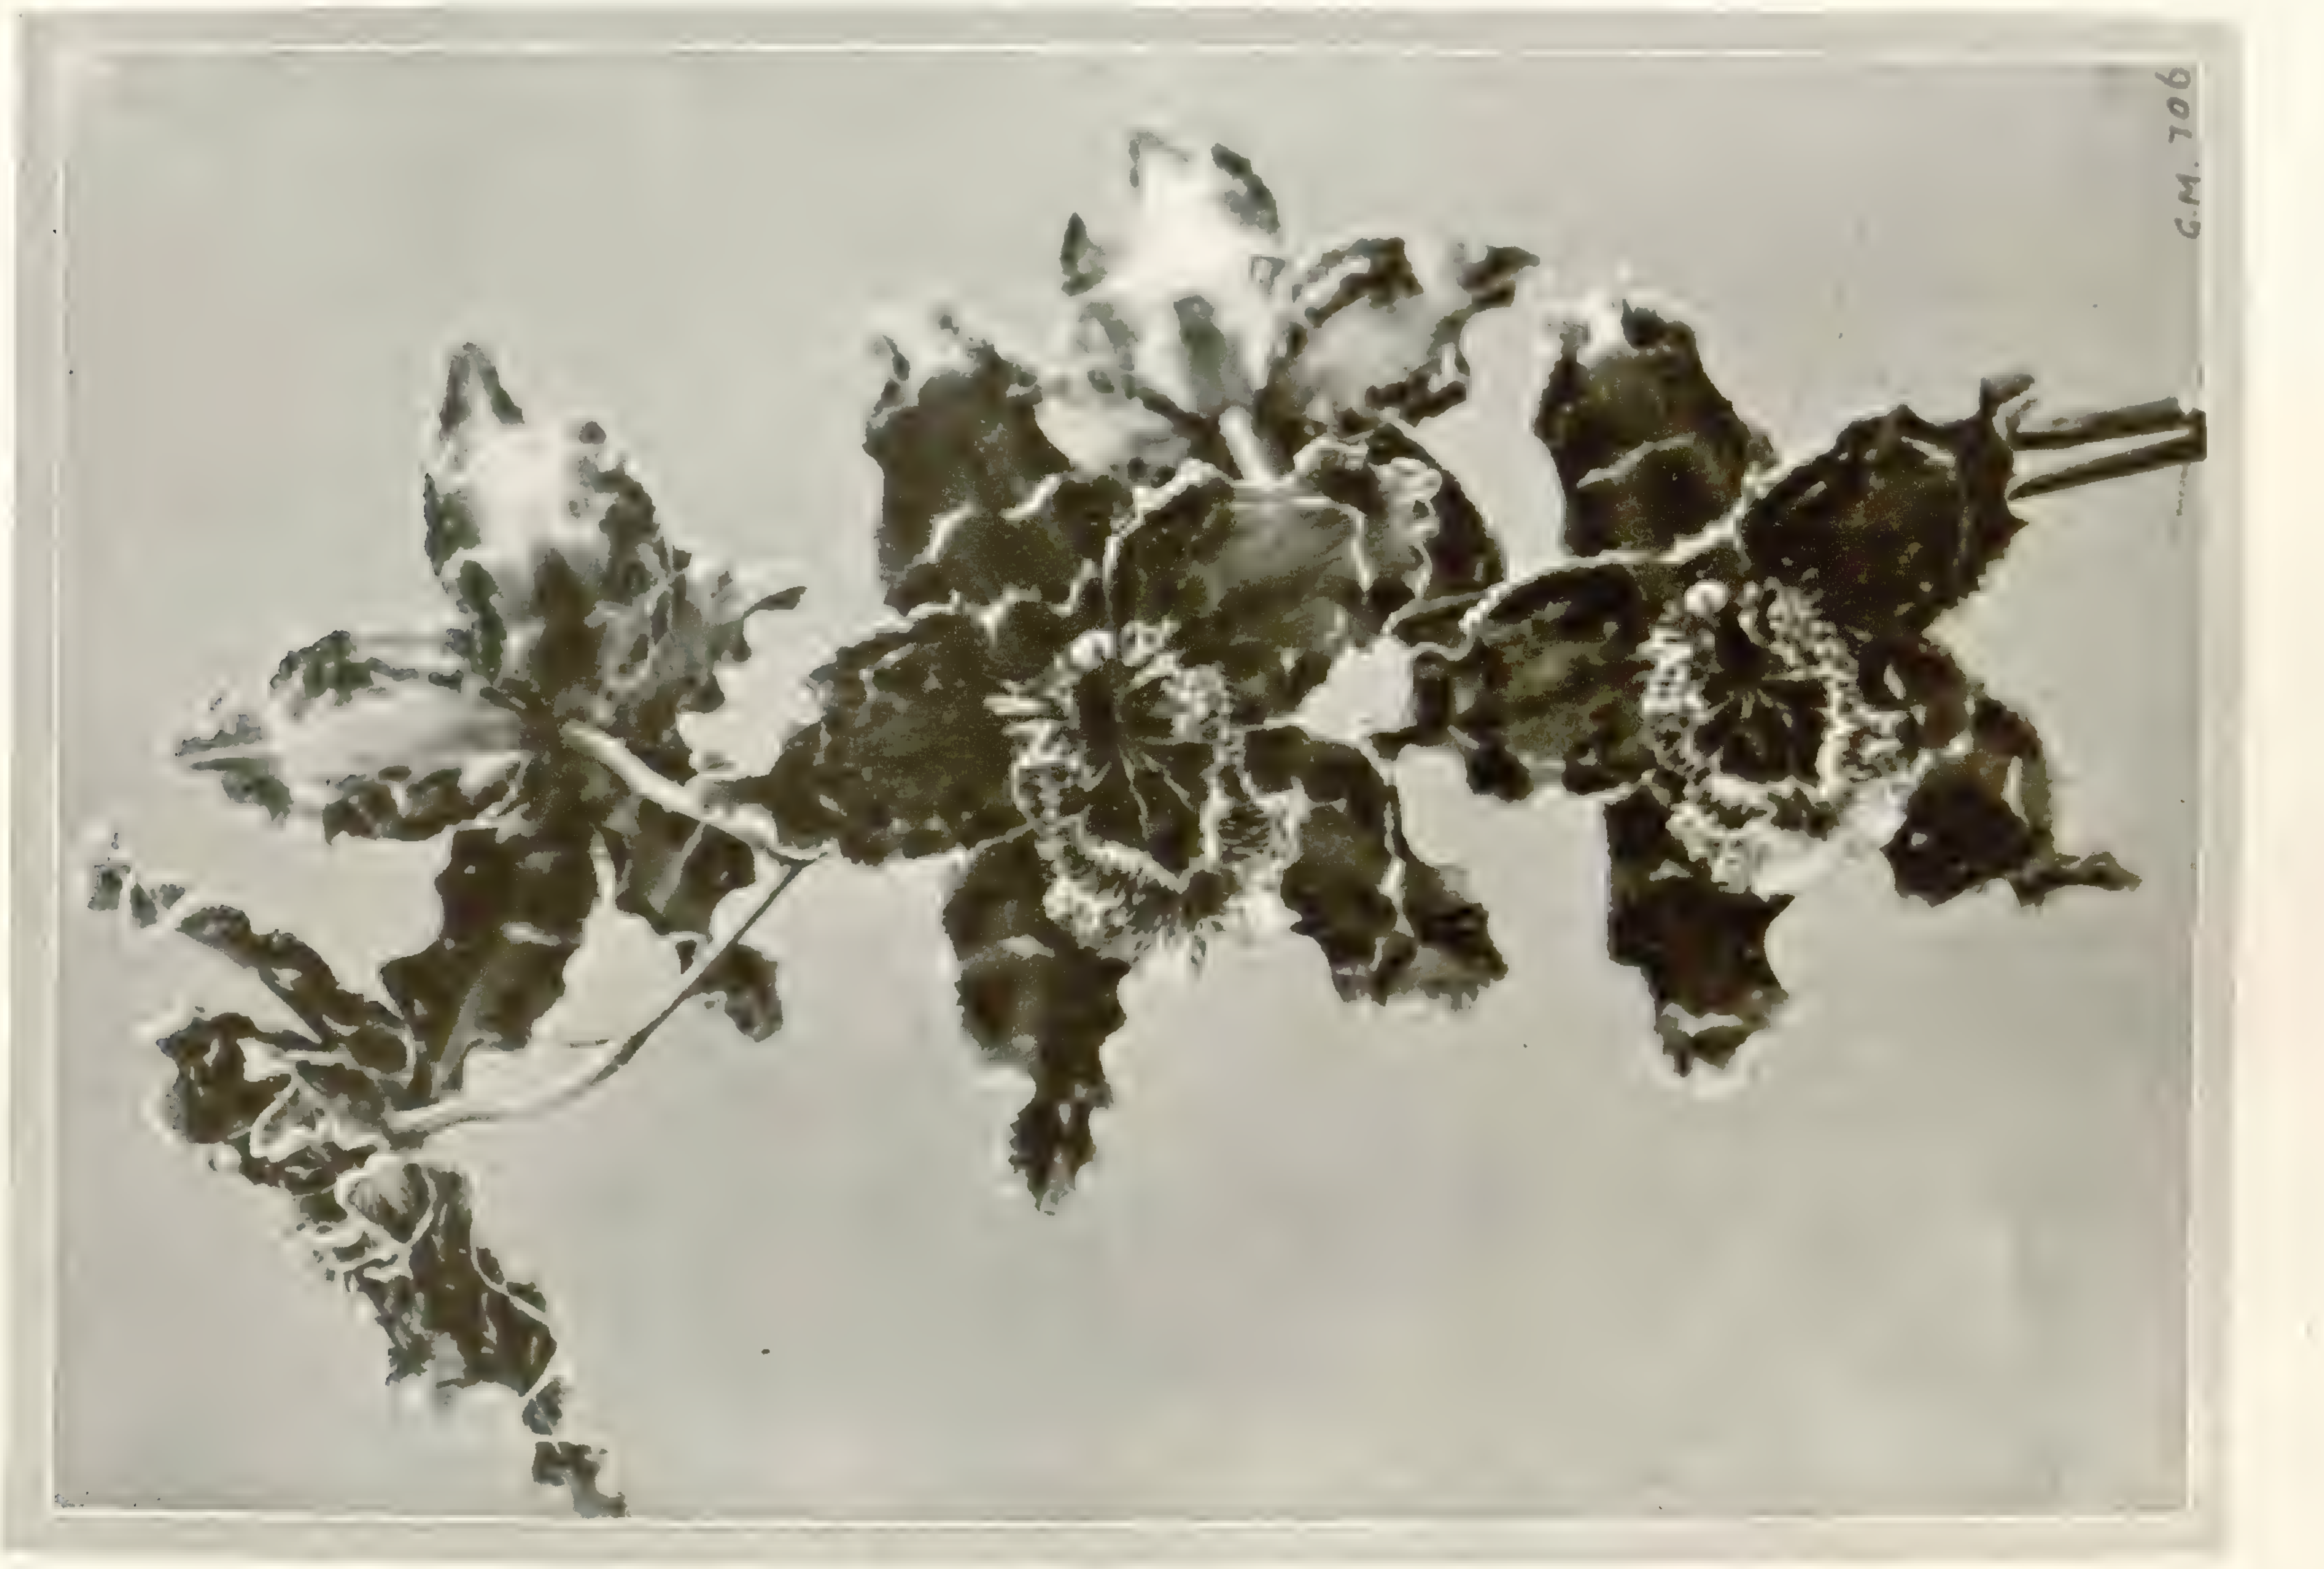
The system I have adopted for many years is a combination of the pit and the raised bed, digging out a pit from one to two feet deep of the required area, and then filling in manure and good soil from the vegetable quarters in alternate layers till the bed is about two feet above the level, the topmost six inches being a mixture of soil and manure. This is done in the late autumn, and each layer of soil and manure is sprinkled with basic slag. The winter's rains cause it to sink perhaps a foot, while the soil gets well mixed with the layers of manure, enabling the bed to hold more water than a two-feet thickness of manure would do by itself. Thus the bed has the necessary conditions for fruitfulness—a firm rich soil, with plenty of phosphate in it, and an ample supply of moisture, the lack of this latter in a dry summer being the charge which advocates of growing on the flat often bring against the raised bed; while I am convinced that the lack of phosphates in sufficient quantity is often the cause of diminished fruitfulness, or early termination of season. If too many plants are not grown on the space allotted, one good soaking—not a mere sprinkling with a rose—will generally carry the bed through the summer.

As regards raising the plants, if one does not want marrows in early or mid-July, when peas are in abundance, the easiest way is to plant the seeds on a bed early in May, where they are to grow. If marrows are wanted early, the plants must be raised in a frame, or in a house first, and afterwards hardened off in a cold frame, putting only one seed in a forty-eight pot filled with good turfy loam. It is of no use sowing the seed early out of doors, as the seed does not germinate in a lower temperature than 55 deg. F., and before the soil reaches this the seeds will have rotted. I have known this to happen in a cold frame too.

Alger Petts.

ODONTOGLOSSUM PERCULTUM COOKSON'S VAR.

The beautiful Odontoglossum percultum, obtained by crossing O. Rolfæ and O. ardentissimum, is one of the finest of the secondary orchid hybrids, and O. percultum Cookson's var., is one of the deepest-coloured forms of it. This handsome variety was exhibited at the Royal Horticultural Society's meeting of April 6 last, by Mr. H. J. Chapman, gardener to N. C. Cookson, Esq., and was described in our issue of April 17. We figure it herewith, as the variety is of special interest in connection with the account of the Oakwood gardens also appearing in the present issue. We may add that O. percultum Cookson's var., raised at Oakwood, is deep mauve-purple with white margins and a few white veins, and a dark orange crest.



ODONTOGLOSSUM PERCULTUM COOKSON'S VAR.
F.C.C., R.H.S., April 6. N. C. Cookson, Esq., Oakwood, Wylam. Flowers mauve purple and white.

Mignonette is always welcome in the garden, and to ensure a constant supply of cut flowers all through the summer, frequent sowings should be made in various parts of the garden. Give a good surface dressing of finely-sifted old mortar rubbish.—Edwin Beckett, Aldenham House Gardens.

TENDER GREENHOUSE ANNUALS.

Mid-April is soon enough to make sowings of the more beautiful of greenhouse annuals which are invaluable for both room and conservatory decoration in summer and autumn.

One cannot conceive anything more lovely than Celosia plumosa, when the strain is good, but imported seeds are not likely to produce anything but weeds. It is possible to obtain a large packet of seeds for sixpence, containing six times as many seeds as the half-a-crown packet from an English firm which has a reputation to maintain, but after all the trouble expended upon them they are fit only for the rubbish heap. Celosias can be raised and grown entirely in a greenhouse, but the best plan is to sow thinly in boxes of light sandy soil, and to place them upon the fermenting material in a frame. Under these conditions germination takes place in a few days, and when large enough, or the true leaf has been formed, the seedlings should be pricked off into boxes three inches apart. When the plants meet, every alternate plant should be transferred to other boxes at six inches apart, which will allow the entire stock six inches of space for development. Provided they are syringed overhead morning and evening and kept rather close, splendid plants will soon result fit for six-inch flowering pots. When thoroughly established they must be gradually hardened off, when they may be brought into the greenhouse. Turfy loam, leaf soil, and sand will meet their requirements, and a very important point is, the plants must be maintained in a progressive condition from the outset. A slight check brings about premature flowering. Apart from their value as conservatory plants they are unsurpassed as bedders, and a good stock should be grown in order to make provision for both purposes.

Cockscombs require precisely the same treatment and are very effective as bedders when thinly disposed and carpeted with white lobelia, or dwarf white or yellow antirrhinums. It goes without saying that they contribute much brilliance to the greenhouse over many months.

The improved camellia-flowered balsams call for attention, and certainly as decorative subjects must be placed in the front rank. Failure to grow them successfully may be traced to subjecting them to too much heat in the early stages, the evil being aggravated by staging them a considerable distance from the glass. Hence the importance of attention to these matters, and the proper way to proceed is to sow in pans, which should be placed as close to the roof glass as possible, where the plants should be allowed to remain during their various stages in pots until they commence to flower. It may be of service to explain that splendid plants can be had by sowing upon a warm south border early in May. The writer prepares a bed of light soil, to which a liberal quantity of cocoanut fibre refuse and short manure is added, and the seeds are sown two inches apart. When large enough, or the plants meet, two-thirds are transferred to flower beds and borders, and the remainder allowed to develop, preparatory to being potted for greenhouse decoration. The presence of the fibre refuse and manure near the surface enables the plants to be lifted with a large ball of soil, and they receive no check whatever. Robust, in fact, perfect specimens can be raised in this way.

The Zanzibar balsam Impatiens Sultani is worthy of notice, being a very floriferous subject, and further, the scarlet flowers are produced in uninterrupted succession for many months. It grows with the greatest freedom in a greenhouse.

Datura chlorantha and D. cornucopia give us handsome and fragrant blossoms, and are very valuable where a large conservatory has to be furnished. A good start may be given them, as with celosias, and when transferred to 6in. pots they will grow with great rapidity in the greenhouse.

The fine globular flowers of the Globe amaranth, in purple, orange, and white are not to be despised, and since petunias are now generally treated as annuals, a beautiful strain, such as the well-known Carter's Emperor and Empress, should be selected for the greenhouse. The colouring and markings are simply exquisite, while the individual flowers are immense and of great substance.

It is hardly necessary to point out that the season of beauty of these plants is appreciably lengthened by the application of stimulants on the approach of the flowering period, and subsequently at intervals of ten days or a fortnight. Nor is it necessary to explain that they resent drought at the root, and speedily show resentment by passing out of flower. Walter H. Aggett.

UNDER THE PERGOLA.

The pergola for the display of roses and other climbing flowering and foliage plants has become almost a necessary part of a garden. Too often, although we see the pergola well planted and attractive, but little heed is paid to the walk under the structure. Frequently the path is of the wrong material either for use or appearance, and nothing is planted below to interest the visitor, whereas the pergola might be made doubly interesting by a little forethought in arranging a scheme of planting beneath.

The first point to consider is the path or space underneath that is to be used as a means of connection between one part of the garden and another. It is often said that no pergola should be constructed without an object. The late Lord Battersea was of that opinion, and he was an authority on the subject, having, perhaps, as many and as varied in character in his charming garden at Overstrand, in Norfolk, as most folks. He never built a pergola without an object in view—a summer house at the end of a path, an approach to a lake, colonnade, or alpine garden. The latest pergola he constructed was a long massive one, built of bricks, to hide a building in the distance, and this it did most effectively, although the latter was on an adjoining estate.

Grass is a common covering for the pathway under the pergola, and very nice it looks during the summer, but with much wear and a want of light, owing to the growth overhead, the grass becomes worn and shabby. Flag stones, as obtainable in many parts of London, where building operations are going on, make quite a good path; in fact, at the present time they provide the most fashionable method of treating a pergola path. The stones should not be laid in too precise a manner, and there should be dwarf growing plants, as saxifrages of sorts, thymes, sedums, armerias, Iceland and Welsh poppies, antennarias, Arenaria balearica, and such-like hardy subjects growing between them. An extra space of an inch or two left between the flags will provide all the space required.

Old bricks of a thin pattern are much prized by some persons for paths, and among these planting is equally easy. Gravel is sometimes preferred; indeed, there is no limit to what the path shall be made of. On each side of the pergola a narrow or a wide border can be made, and if planted judiciously quite an interesting feature can be made about the base of the permanent pergola plants, which, in time, become bare, particularly if they are mainly roses. These rambling roses have a decided tendency to make the bulk of their growth on the top of the pergola, and, naturally, there are not many growths spring from the base.

Whether the border on each side shall be one foot wide or one yard depends upon the width of the structure; if this be eight feet or more wide, and there is space outside, the border can be at least three feet wide, say, one foot within the pergola and two feet outside. I have seen borders a foot wide planted with thrift (Armeria maritima), which looked remarkably well, as it was in flower twice yearly. Mrs. Sinkins pink is an attraction to many, and so is lavender in a single row. Dwarf-growing roses in a mass of one sort are appreciated by many.

A low, irregularly formed rockery planted with alpines and dwarf-growing bulbs, as narcissus, muscari, cyclamens, and any low-growing subject that will flower in the spring, will make the pergola an attraction before the regular occupants are sufficiently advanced. Summer bedding plants may be employed with pleasing effect, supplementing these in the autumn with dwarf shrubs for winter effect. E. Molyneux.

GESNERAS.

These lovely flowering plants are exceedingly useful for the embellishment of the greenhouse and conservatory from about June to the end of the year without much artificial heat. The flower is not the only attraction which the plant possesses, as the leaves are traversed with veins carmine in colour, and shading to a bright blue. If they are held in the direct sunshine, the colours almost resemble those found in stained-glass windows.

The plants may be raised from seeds or from cuttings. The strains have been greatly improved during the past few years, but I shall never forget the favourable impression these plants made when I saw a magnificent batch of them grouped in a cool glass structure in the North of England about twenty years ago. Scarcely a pot could be seen, as they were hidden by the massive, healthy leaves, and the flowers were there in profusion.

Growing plants should now be repotted, using fibrous loam two parts, peat one part, leaf-soil one part. Sufficient sand or road drift must be put in to render the compost porous. After crocking the pots, place some very fibrous portions of turf on the drainage material, and then a few half-decayed tree leaves; the roots of gesneras thrive amazingly in such a mixture. The plants like moisture, but it is best to supply it in the atmosphere, and not to syringe the leaves. Gesneras do well grouped on the floor of a conservatory.

Geo. Garner.

The Double Arrowhead.—Sagittaria japonica flore plena is one of the most satisfactory of all water plants. The flowers are exceedingly large, of a pure glistening white, in the form of close-packed balls borne on spikes like a huge double hyacinth, thrown clear above the water. The foliage is extremely handsome, of the true arrowhead form, having the barb-like points of great length. The resting crowns are almost egg-shape, and the plant increases fairly rapidly, and is perfectly hardy if planted in muddy soil in water 12 to 18 inches in depth.—Thomas Smith.

SOME GARDENS ROUND NEWCASTLE—I.

Although we usually associate Newcastle with coal, big guns, chemical works, and shipbuilding, or, from another point of view, with Hadrian and the Roman Wall, and with battles innumerable, yet we may also well associate it with good gardening. Within a few miles of this great and busy city one may visit numbers of famous and interesting gardens, public and private, and find in them much to interest and much to admire. Here, amid the hills of Northumberland, the climatic conditions are not the most favourable, hence the more credit is due to the enthusiasm of owners and the skill of the gardeners. For the purpose of discussing gardens round Newcastle it would be necessary to divide a ten or twelve mile radius into several districts. In the present instance, the district taken is that part of Tyneside, a delightful country, stretching from Wylam nearly to Hexham, but also, for this purpose, including a part of the famous city itself, so as to indicate some of its fine parks.

Newcastle is a famous flower-show district, and its own summer show is a fine one. But for enthusiasm pure and simple, one must go to the mining villages—clean villages, not dirty, dust-begrimed places—where each man has his ample plot of garden, and often a decent greenhouse or two builded with his own hands. In a previous issue I have shown what Prudhoe and South Wylam can do in this connection, and this applies in lesser degree to other places in pleasant Tyneside. The larger private gardens of the district are noted throughout the country for their orchid collections, for their fine scenery, their herbaceous and alpine collections, for their roses, and for their generally good upkeep. In the following notes a few of these gardens are described.

Howden Dene.

Corbridge-on-Tyne is a very old village, and it is reached from the south side of the river by a quaint and stout old bridge that withstood the tremendous floods in years long past when no other bridge over the Tyne was left standing. Historically, Corbridge is particularly interesting. Situated on the line of the old Roman wall, it was also the site of the ancient Roman town or fortress of Corstopitum, and the antiquaries have made many interesting discoveries during the process of excavating on the site of the Roman stronghold.

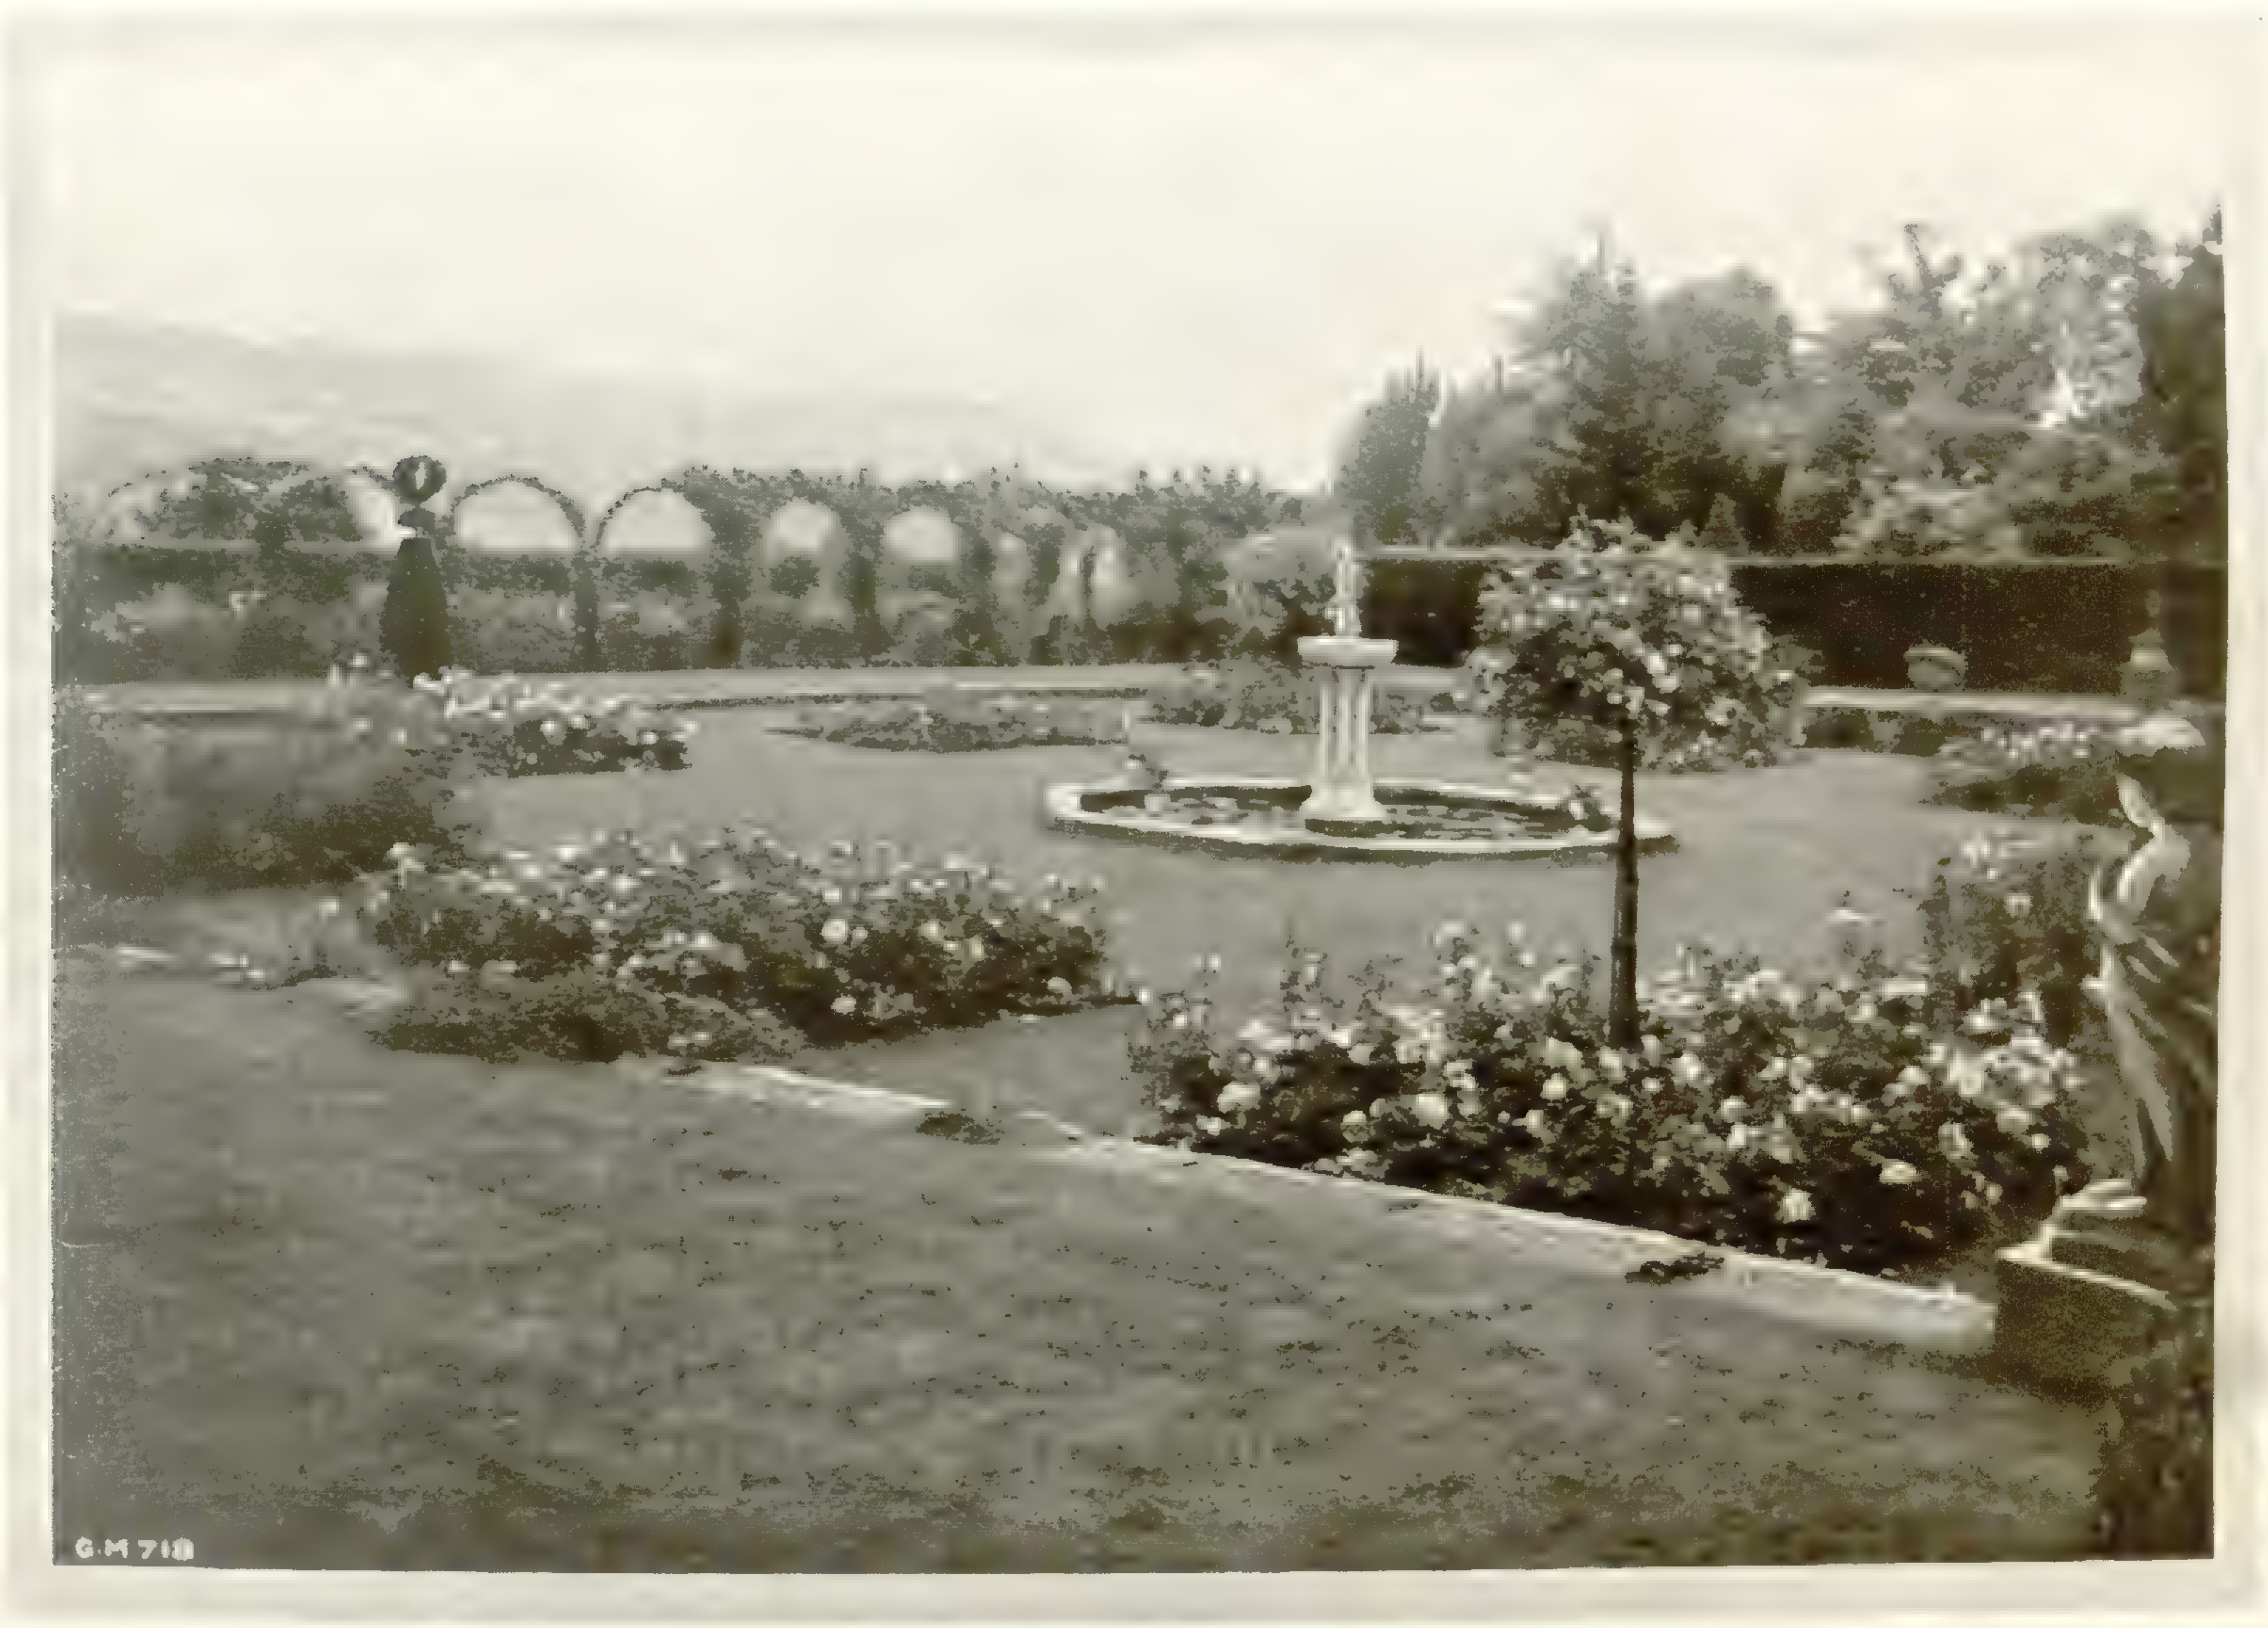
Turning to the right after crossing the bridge, a broad road rises steadily eastward, with houses and gardens of considerable size at intervals on either side. A mile and a-half along is Howden Dene, one of the prettiest places in all Tyneside. It is difficult to conceive what more could well be done to increase the beauty and add to the interest of the gardens. Both the owner, Joseph H. Straker, Esq., and the gardener, Mr. J. Winder, are to be envied, and to be congratulated, upon the design and excellent upkeep of Howden Dene. I need hardly say the gardens are famous in Tyneside, no real garden lover is refused admission, and the gardeners attached to the several Mutual Improvement Societies in the district have foregathered here in great strength at the invitation of Mr. Straker. Beautiful views are to be obtained from the garden front, but fine scenery is the inheritance of each and all of these high Tyneside gardens.

The French garden is peculiarly attractive, and is to the east of the mansion. Three years ago a kitchen garden occupied the site, but a new kitchen and fruit garden has been formed on the other side of the main road, and the old site converted into a place of great beauty. This garden is in two parts, each sunk about eighteen inches below the surrounding level, and a broad grass walk surrounds the whole within the shelter of yew hedges, and tall trees beyond. The western half is devoted entirely to roses and violas, save for the water lilies in the pool around the beautiful fountain in the centre. Killarney, Madame Abel Chatenay, Madame Ravary, Duke of Edinburgh, and other roses fill the beds, each bed containing but one variety. Each corner bed has also a tall weeping standard rose, Dorothy Perkins and Leuchtstern being the varieties used with great effect.

In the other half of this charming garden the plan of the beds is distinct. The outer beds are filled with roses, and one cannot fail to notice how splendidly Madame Abel Chatenay and Killarney flourish here. The inner beds are devoted to carnations, the pink Raby Castle being the favourite variety. In the centre of this loveliness, all set in beautiful greensward, is a sun-dial which, somewhat unkindly, informs you that:

> Time by moments steals away,
> First the hours and then the day:
> Small the daily loss appears,
> Yet it soon amounts to years.

One could linger long here. There is a fine pergola where Gloire de Dijon, Dundee Rambler, Carmine Pillar, Felicite Perpetue, Cheshunt Hybrid, and Crimson



ROSE GARDEN AT HOWDEN DENE.

Rambler roses fulfil their mission as ably as the dwarfs in the beds. Along the south side is a long border of roses, with arches of roses overhead, Dorothy Perkins and Gloire de Dijon being the varieties most freely used on them.

Beyond the southern hedge of this French garden of roses, and all unexpected, is one of the finest of herbaceous borders, with a broad path of flag stones between it and an equally fine border of dwarf roses. The whole lies open to the south, between sheltering yew hedges. The herbaceous plants are a grand lot of the finest kinds and varieties, margined with low-growing alpines, saxifragas, oxalis, Lithospermum prostratum, sedums, etc., that are allowed—within reason—to extend over the flag stones. A similarly pleasing margin is provided for the roses. What a magnificent opportunity is here for such painters as Mr. G. Elgood and Miss Beatrice Parsons! Were I an artist, with a penchant for garden scenes, I should spend a whole summer in Tyneside, and, Mr. Straker permitting, Howden Dene would provide me with material for any number of pictures.

This is by no means the only herbaceous border; there is one to the west of the rose garden where phloxes are wonderfully well grown, both named varieties and selected seedlings, stately, fragrant, and beautiful. Lower than the long flag-paved rose and hardy flower walk are the tennis courts, sheltered by a holly hedge, with its supporting rockery-wall decked with those delightful alpine plants that love the sunshine and seem to need so little soil for their sustenance. From the comfortable tea-house one has a fine view up to Hexham, as well as down this wonderful and beautiful Tyne valley.

In the Howden Dene gardens one passes quickly from one beautiful scene to another, all different from the rest. Full advantage has been taken of the old trees and of new plantations, and good use has been made of evergreen hedges, while the great diversity of ground level has also helped to make each new scene a glad surprise. The grouping of the choice shrubs beyond the tennis courts has been well thought out, and here one finds Buddleia variabilis, Garrya elliptica, Cotoneaster microphylla, C. Simonsi, and C. horizontalis; spiræas in great variety, golden hollies, berberis, gorse, the Savin, Dipplopappus chrysophyllus, pyruses, magnolias, and many another fine subject, all well developed, and making up a most interesting collection. Further along, a little clearing amid the trees has been paved with flag stones, a central bed is filled with nicotianas and fuchsias, and all around are quaintly clipped yews.

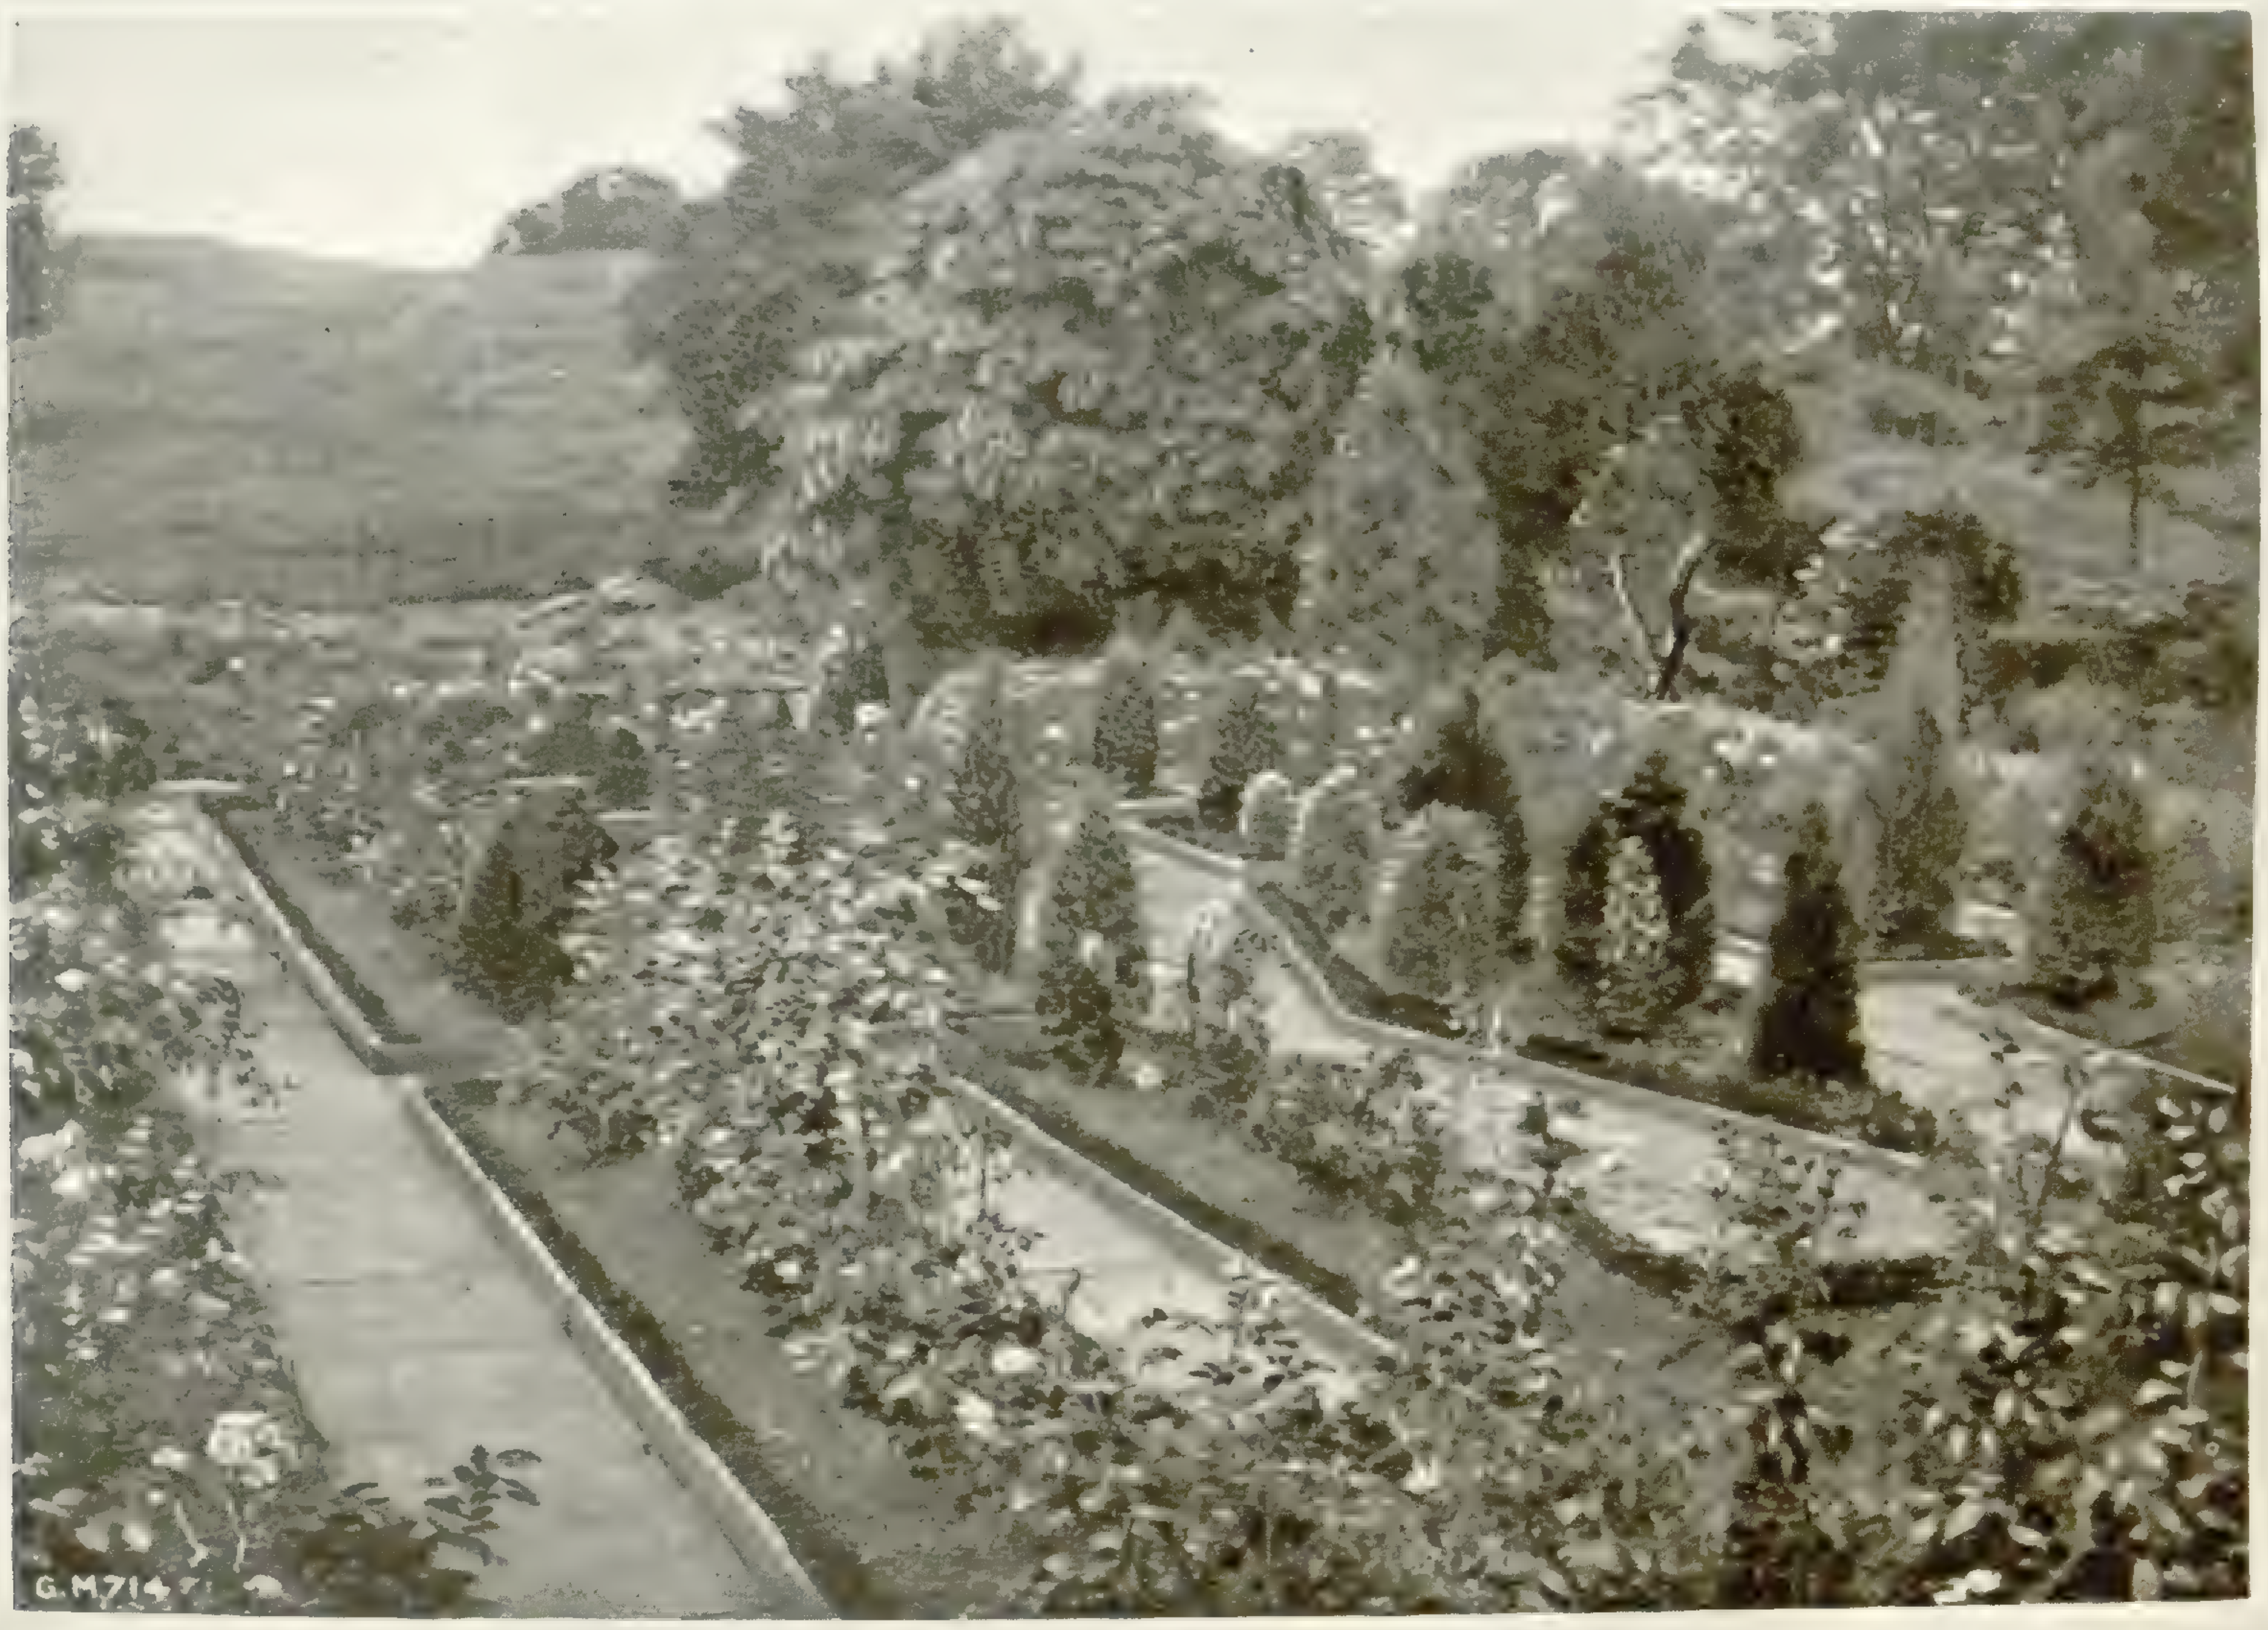
The stone-built house, with its portico, has no flower beds immediately in front of it, but a few vases of fuchsias and pelargoniums stand at regular intervals at either end. Near by are some fine retinosporas, berberis, and tree ivies, and behind them some tall Wellingtonias, beeches, and maples, and a big Prunus Pissardi. Passing to the extreme west of the garden the scene changes again. Here the ground falls so abruptly into the Dene that a steep, winding flight of old stone steps is needed to give access to it. No doubt there was once a stream running down this ravine, but now the grass clad slopes provide a home for a goodly collection of conifers. A few of the finest are Retinospora pisifera aurea, Cryptomeria japonica elegans, Cupressus Lawsoniana variegata, C. L. lutea, Abies concolor, Juniperus chinensis, and J. c. aurea, Abies Parryana glauca, Cedrus Deodara, C. atlantica, and Sequoia gigantea. The head of the Dene has been transformed into a steep rock garden, with a tiny streamlet trickling down its face, and falling into pool after pool till it reaches the bottom of the valley. This is a new feature, but iberis, Kæmpfer irises, Primula japonica, alpine auriculas, veronicas, and other good things have established themselves. A delightful fragrance hangs over the rock garden and the Dene, produced by an abundance of mignonette sown on the outskirts of the rockwork, in the narrow border along the top, and among the shrubs that line the path through the woodlands around the crest of the Dene. It was a happy thought, to sow mignonette freely like this, one of those little things that cost so little and mean so much.

I must pass the fine set of glass-houses and their well-grown contents, leaving readers to assume that tomatoes, grapes, roses, begonias, orchids, ferns, crotons, palms, cucumbers, and the rest are in the best of health—it could not be otherwise in such a fine establishment. The kitchen garden, too, must share the same fate, for my space is already exceeded, and yet so little has been said of Howden Dene garden—a "garden that I love."

FLOWER BORDERS AND STONE WALK, HOWDEN DENE.

Castle Hill.

There is one point in which nearly all the Tyneside gardens referred to in these notes agree, and that is their situation. In every case, the gardens are hilly, and the mansion at a considerable altitude. In some instances, the rise to the residence is long and steady, as at Oakwood, while in others it is very sharp, especially from the valley of the river, and this is so at Castle Hill. The woodlands actually hang over South Wylam station, and to these one may pass over a wooden bridge from the station platform, up by a steep path, to the pleasure grounds where hollies abound and are in superb health. Then comes a plateau on which the creeper-covered mansion stands, sheltered by trees, amid broad lawns and sloping flower beds and borders. Very quickly the ground falls away again to the south, and in the lower grounds are the vegetable and fruit gardens and the glass-houses. Between the pleasure grounds and the kitchen garden is a wide field where Highland cattle are always kept. Castle Hill is



FORMAL ROSE GARDEN, CASTLE HILL.

the residence of F. Newall, Esq., and his head gardener is Mr. W. C. Fraser.

There are fine views over the hills from Castle Hill, as well as up the valley; there are hardy perennials in abundance; there are sweet peas as finely grown as one could wish; there are vegetable crops grown with great skill and care; there are chrysanthemums that reveal the hand of the master; there are odontoglossums and cattleyas that make the beginnings of what may become a useful orchid collection; there are splendid cupressus, pines, cedars, beeches, and hollies, a long drive, and a couple of very pretty and well-kept cottages; there are all these and many other points of interest at Castle Hill, but it is to two items of special interest, and chiefly to one of these that I must confine attention. One is the rock garden and the other is the rose garden, or, rather, the two rose gardens. These delightful features are in the south-west part of the gardens below the lawns, and they lay very warm and cosy in the shelter of the hills and the surrounding trees.

The rock garden is a rather large one, set up by Messrs. J. Backhouse and Son, of York, but it was so recently finished at the time of my visit that it would be unfair to describe or criticise it. The general idea is that of low mounds of rock, with gentle slopes from one to the other, and easy alpine paths giving access to every part. A new rock garden nearly always suggests the idea that far too much rock has been used, simply because the plants have not had time to spread over the boulders, and so soften the appearance of the whole scene. Another year of growth and [illegible] will make all the difference in the Castle Hill rock garden.

Close to the rock garden is a formal rose garden, with flagged paths and stone margins, as well as box edging to the regular beds. Along the west side is a hedge of Wichuraiana roses supported by a fence of telegraph wires. On the east and south-east sides Dorothy Perkins does duty as a hedge plant, and right well does she perform that duty, appearing to make it a great pleasure. Along the north side of this formal rose garden, and practically on the top of the retaining wall that keeps it from falling into the lower rose garden, is a beautiful hedge of fragrant lavender. Hybrid perpetual, China, and hybrid tea roses fill the beds, except that the inner corners of the beds, and the central diamond-shaped bed are marked out with closely clipped green and golden cupressus. Experiments are being made with some of the more tender tea roses, and probably these will prove a success in this sheltered spot.

The second rose garden is several feet lower than the one already noticed, and next to it. It is longer than broad, and rectangular; it has a flagged path all round, and a path starting from the middle of each side meets in the hexagonal centre, where a fine old font is set up in the central bed. There are four prominent and large beds of dwarf roses, edged with pinks and violas, and with a small clipped cupressus at each corner. Ferns are taking possession of the lavender-topped wall, and in the border below campanulas are always a feature. In the broader border along the opposite side are more roses, standards and dwarfs, backed by a fine hedge of rambling roses of the multiflora class, including the inevitable Crimson Rambler.

At one end of this rose garden, neatly and prettily encircled with rockwork and popular alpines, is the water lily pond, where Marliac's nymphæas flourish and flower beautifully. Only a few yards from the pool, and snugly placed in the shelter of coniferous trees, and grouped about with spring-flowering shrubs, is the summer-house, from whence the lily pool and the rose garden can be viewed and enjoyed in comfort.

The whole of this lower part of the garden is, as I have shown, laid out in a very unusual fashion. Formality and informality, the old and the modern – rarely are these seen so close to each other. The combination would offend many who are ultra-sensitive in the matter of garden design, but, fortunately, a garden is for the owner's pleasure, and may be conformed to suit his or her taste; and so, in various gardens, one finds the reflexion of varied tastes. These expressions of taste may not all appeal alike to the visitor, but I have yet to find a garden where the taste of the owner has resulted in absolute ugliness and incongruity. With a little weakness for the formal side of gardening, under certain conditions, I greatly admired these rose gardens at Castle Hill, with their flagged paths that need neither roller nor weed-killer, and that are dry and comfortable in all kinds of weather.

Prudhoe Hall.

Prudhoe is a mining village on the south side of the Tyne, not far from Wylam, and, as I have intimated on a previous occasion, it is a famous gardening village, the miners being adepts at plant, flower, and vegetable culture. It is a good climb up to Prudhoe from the river, and Prudhoe Hall, the residence of Mrs. Swan, is perched higher than the village. The garden around the hall is a very hilly one, and, with its ravines, its streams, and its abundance of trees, it is a beautiful place. Strongly built and strongly positioned, Prudhoe could have stood a siege in the old days, and even now, minus artillery, it would prove an intensely difficult place to capture. There is nothing warlike, however, about Prudhoe Hall of to-day. It has fine stables and garage, and a glass-covered carriage yard, where tennis is played when rains are heavy or the weather cold.

Set on the crest of a hill, Prudhoe Hall overlooks a deep, densely-wooded ravine. Directly in front of the hall a broad terrace extends, ending at the tennis court at one end, and concluding with a circular rose garden and fountain at the other. At the west end of the hall is the flower garden, consisting of fourteen beds, set rather closely on the lawn. Six of the beds are filled with roses, chiefly the popular H.P. varieties, with pansies and violas carpeting the ground beneath them. The other beds are filled with tender subjects, such as begonias, pelargoniums, marguerites, lobelia, etc. Sweet peas are grown in the border next the laundry, by the side of the flower garden, and the wall is smothered in summer time with the beautiful old annual climber, Tropæolum canariense. The circular rose garden, with its big beds of Hermosa and Fellenberg roses, and its surrounding rhododendrons, beeches, and maples, is a very attractive finish to the terrace. Two fine vases, each with a variegated agave, mark the end of the terrace proper, and a beautiful three-tiered fountain serves, with the roses, to provide an end and aim for the broad walk.

Considerable interest attaches to the various methods adopted in hilly gardens for the management of the terrace walls. At Prudhoe Hall, where the descent to the ravine is very sharp, the upper terrace wall is particularly substantial, but it is completely hidden by a dense mass of Cotoneaster microphylla that is annually clipped to keep it to the shape of the wall. Last autumn, this was thickly studded its whole length with deep red berries. It is not merely a good plant or two, but a dense wall of cotoneaster about a hundred and fifty yards long. Another very interesting feature of this terrace is the yard-wide border in front of the cotoneasters, for this is filled from end to end with Montbretia crocosmiæflora, and the elegant plant grows and flowers famously.

WATER LILY POND, CASTLE HILL.

But, attractive and well-kept as are the gardens at Prudhoe Hall, the great attraction of the place lies in its splendid belts of rhododendrons, its fine green and variegated hollies, and its woodlands. In the woods at the head of the ravine oak trees abound, and the ground beneath is carpeted with bluebells and primroses, and with foxgloves and oxalis. In the moister places there are great sheets of emerald green moss and colonies of native ferns, while in the varied positions that these woods afford there is to be found an abundance of wild flowers. Crossing the bridge and climbing up the narrow pathway, to where the oak is mixed with beech and silver birch, up near the edge of the moor, the remains of an old illicit whisky still is passed. Very beautiful is this woodland walk, and the exquisite little scenes obtained from it would charm the heart of an artist, and provide sketches for many a picture.

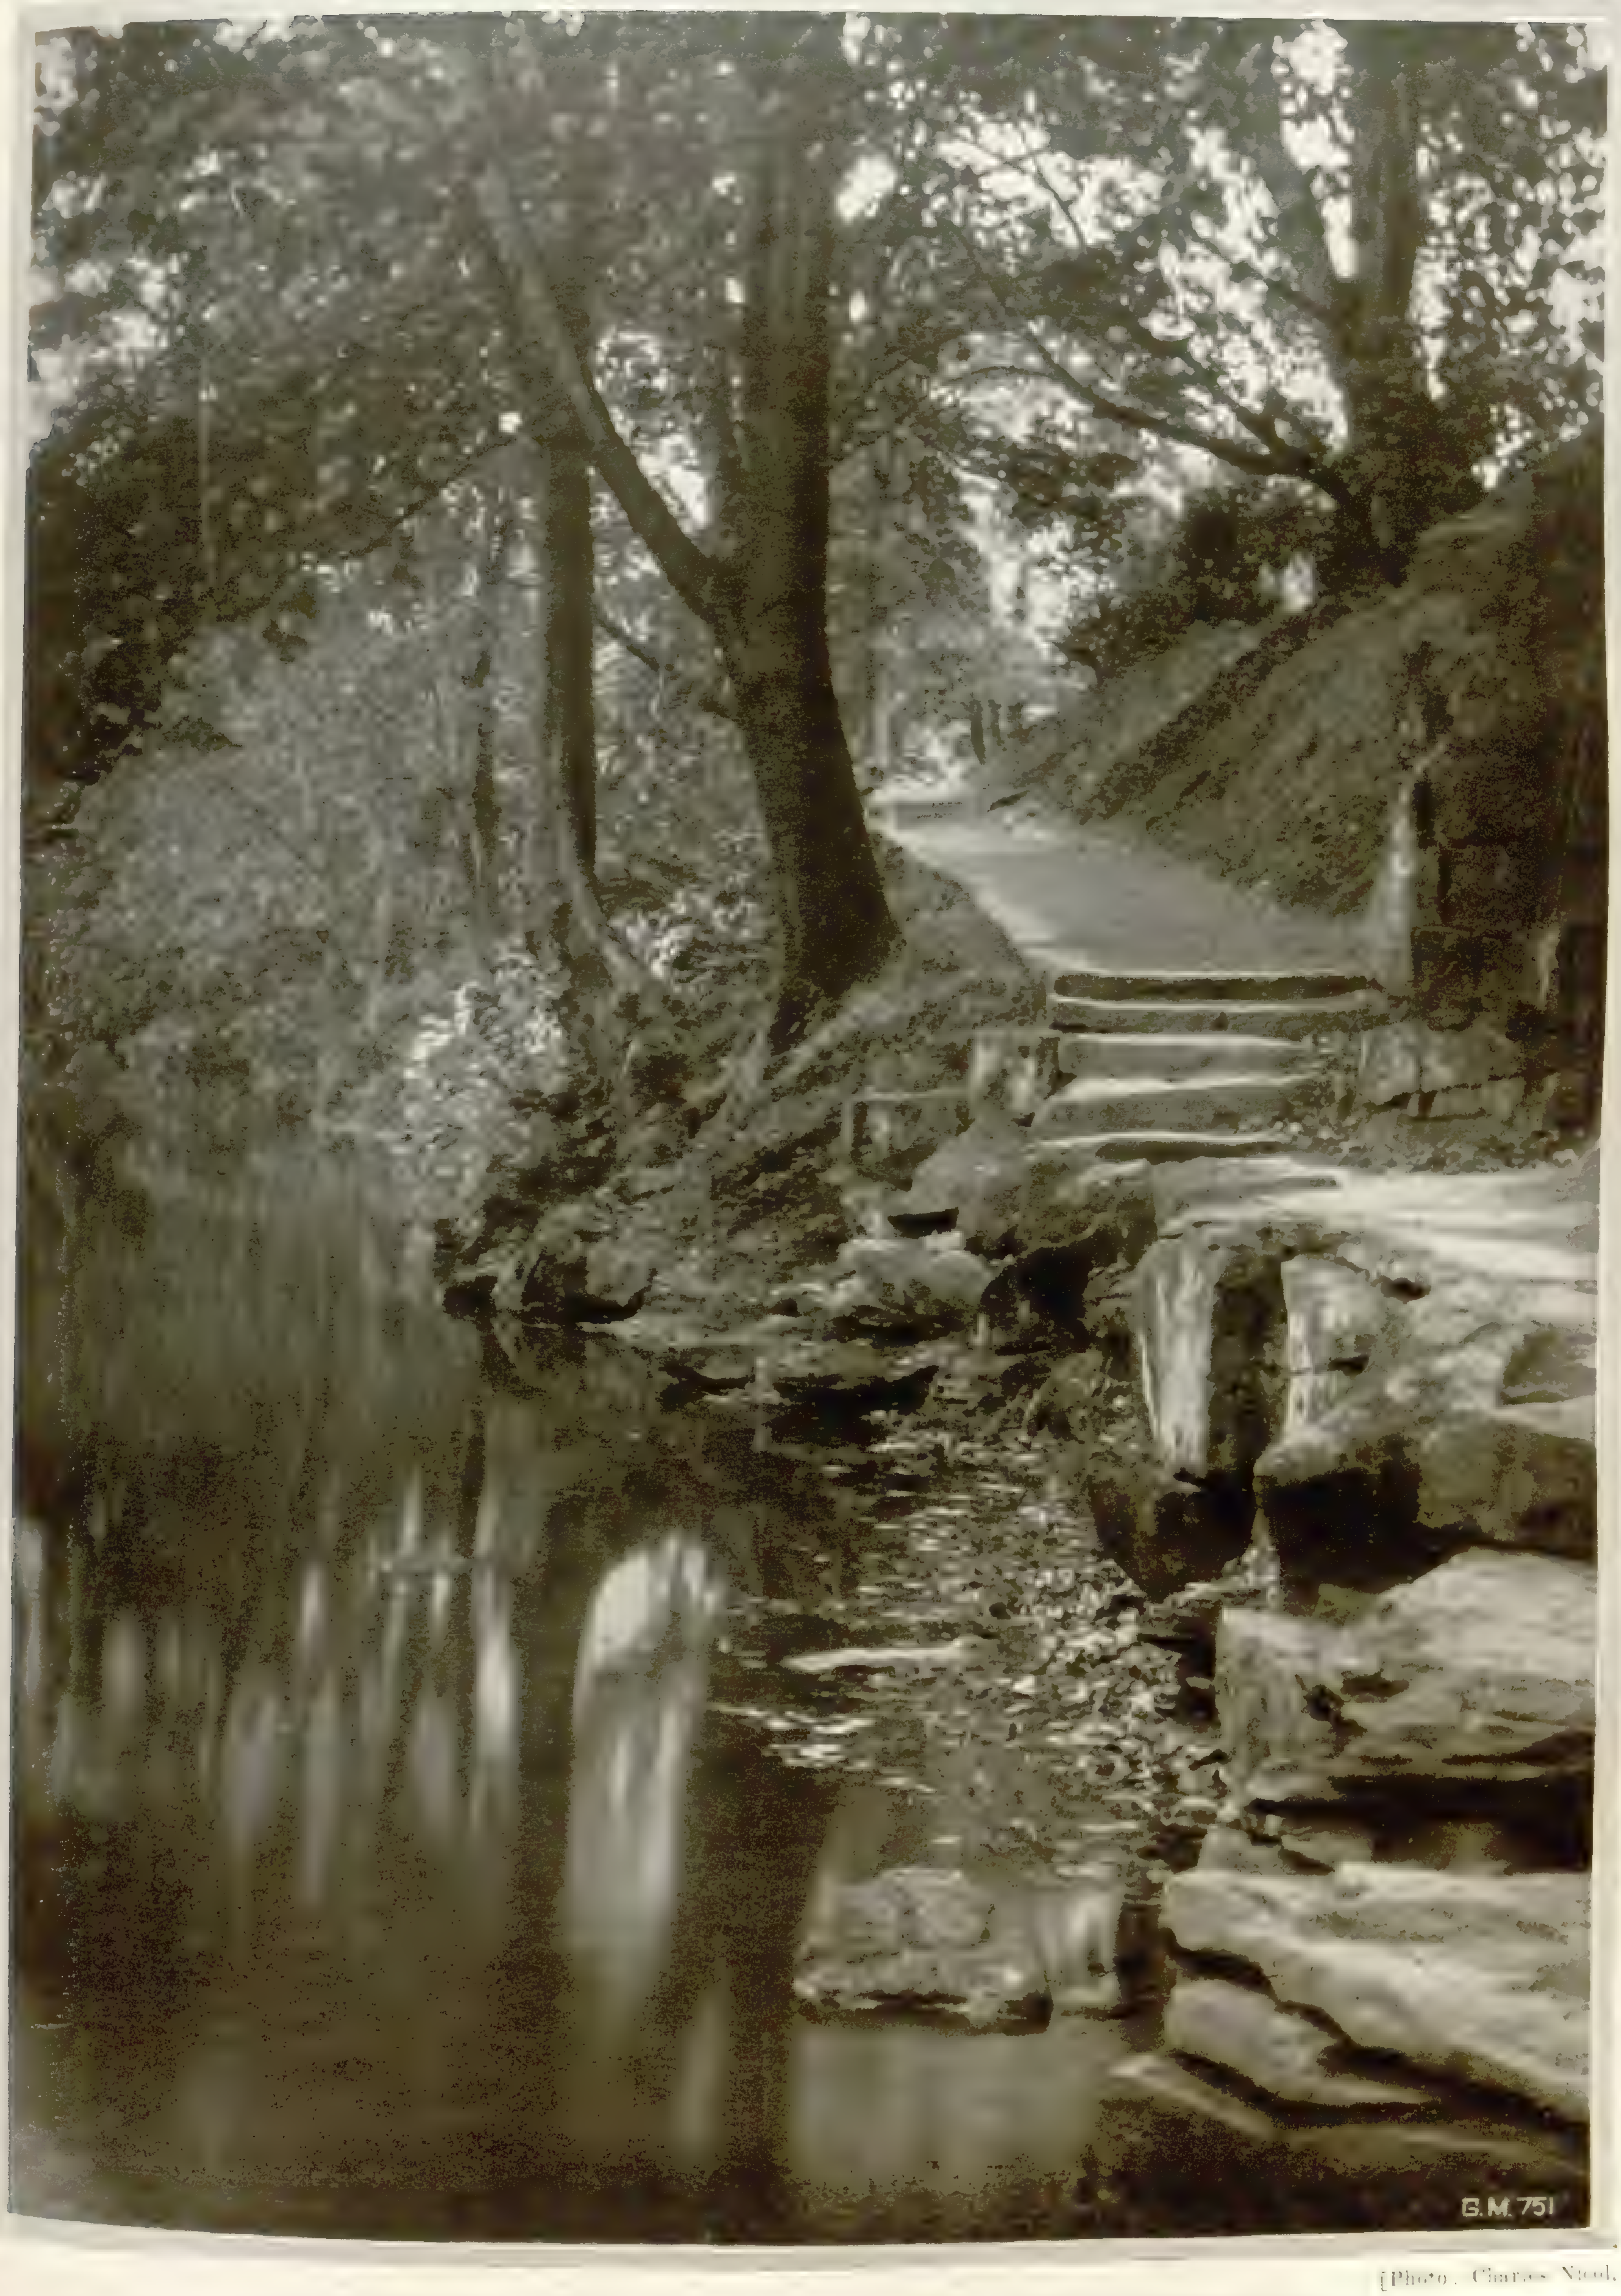
Winding amid the trees and the ferns, working away the soft soil from among the rocks, whirling round some big boulder, forming a pool preparatory to a leap and a splash over fallen tree or rough stone, the Red Burn sings merrily on its way to join the Stanley Burn below, and then on into the Tyne itself.

Coming back to more mundane matters, after a long walk through these delightful woods and grounds, one appreciates, by force of contrast, the very old kitchen garden, where, backed by a range of greenhouses and vineries, there are big breadths of excellent vegetables, rows of apple and pear trees—we are on the southern slope of the high south bank of the Tyne—and broad herbaceous borders on either side of the broad walks. Cordon plums are not invariably a success, but they do fairly well on the walls here. Mr. Shotton, the head gardener, is delighted with his new orchard house, a quite cool, homely structure, wherein he grows peaches, cherries, plums and pears in pots, plunged in low beds. He uses rather large pots, each with two rows of holes bored nearly halfway up. Through these holes feeding roots run out into the bed material, and the deep pot rims provide ample room for top-dressing and watering. The five dozen trees grown are likely to receive many companions in the near future, now that the success of the venture is assured. In the warm houses, it was evident that Mr. Shotton is an excellent plantsman, the fine dracænas, calanthes, and allamandas all telling of good culture. The comparatively new vineries, built by Richardson, of Darlington, are in excellent order, and contain well-managed Madresfield Court, Black Hamburgh, Muscat of Alexandria, and Alicante vines. I noticed a particularly fine Bellegarde peach tree in the peach house, while in the cooler plant houses and the frames there was no lack of plants for the decoration of house and conservatory. It is no easy task to manage such an elevated and hilly garden, but Mr. Shotton is devoted to his charge, and not only manages the garden and grounds to the satisfaction of his employer and his own credit, but he is also a very successful exhibitor at the district shows.

Oakwood.

The best-known of all the private gardens in the western district of Newcastle is Oakwood, the residence of Norman C. Cookson, Esq., a gentleman famous for his wonderful collection of orchids. Oakwood is at Wylam-on-Tyne, the birthplace of George Stephenson, and about a couple of miles from the little stations, one of which is on each bank of the Tyne, and connected by a toll bridge.

Situated at a considerable elevation, Oakwood gardens do not lack fresh air and sunshine; indeed, of the former they sometimes receive too much, because a Tyneside storm breaks suddenly, and often sweeps



[Photo: Charles Nicol.

A CHARMING VIEW IN JESMOND DENE, NEWCASTLE-ON-TYNE.

with great fury along the river valley. Here, as in some other gardens previously described, one finds that, while orchids are the great attraction, there are many other attractions, and these of sufficient importance to make the gardens well worth a visit even if there were no orchids.

Several years ago I had the pleasure of dealing at some length in these pages with the Oakwood gardens, and, though there have been many minor improvements since then, the general character of the gardens remains unchanged.

A broad drive passes up through the grounds, bordered on the one hand by meadows along the lower portion, then, passing through woodlands, a short arm turns into the entrance to the residence, while the main drive ascends beneath abundance of oaks and beeches up to Mr. H. J. Chapman's house, and then out into the main road, having described an irregular semicircle, and risen considerably. The numerous glass-houses are near the residence, and so, of course, are the gardens proper. The little home farm lies behind all these, and the greater part of the kitchen garden lies to the left of the upper portion of the drive, on a broad bank that slopes toward a little stream. Rabbits abound in the neighbourhood, hence Mr. Chapman has to use wire netting freely to keep these from his various vegetable crops.

One feature of the Oakwood Gardens that has been considerably developed during recent years is the collection of alpine and herbaceous plants. Mrs. Cookson has always taken a special interest in these, and the collection is now a fine one. There is one very long border, extending in a line with the garden front of the house, and backed by a unique and tall laburnum hedge. Here the bold subjects are most effectively planted, and delphiniums and pæonies are particularly good. Sheltered by walls and trees, near to the orchid houses is a garden of hardy herbaceous flowers, where in summer time annuals and biennials are also grown extensively. Here, too, delphiniums are especially fine, gaillardias bloom splendidly in great variety, and phloxes and pentstemons yield an abundance of bloom. Some distance from this garden is the alpine and water garden, where, in a very sheltered spot, a pool of water has been margined with rockwork. Gentians of various kinds, ramondias, saxifragas, and sedums in bewildering variety, dianthuses, and Daphne Blagayana are a few of the choice alpines that flourish here. Through an extension of the low rock garden there runs a broad, rough stone pathway, leading to a rose-clad rustic summer-house. Fine groups of Saxifraga peltata and Anemone palmata are noticeable hereabouts, and on the rocks the masses of the golden-flowered Hypericum reptans are very strikingly effective.

ROSE GARDEN AND FOUNTAIN, PRUDHOE HALL.

The pool itself is the happy home of the choicest of the water lilies, the white, yellow, and flesh-pink varieties of M. Marliac's hybrid nymphæas occupying considerable space and producing handsome leaves and noble flowers. With these are associated such fine nymphæas as N. Robinsoniana, N. Jas. Brydon, and N. Ellisiana.

There are many fine trees at Oakwood, and a notable one is a big copper beech that faces the laburnum hedge, across a broad gravel path. Hollies do well at Oakwood, and so do rhododendrons, and there are large specimens and groups of each, providing shelter when the deciduous trees are bare. The rhododendrons also produce an abundance of flowers, but there are flowers of many kinds at Oakwood, and plenty of them at all seasons of the year. We expect a summer glory of flower and fragrance in every garden, and latterly we have come to look for an increasingly beautiful spring display. At Oakwood the spring flowers have for many years been a great delight and beauty. Under the trees, in the woodlands, round the meadow margins, and along the streamlet sides there is a wealth of daffodils, primroses, polyanthuses, bluebells, snowdrops, violets, anemones, etc., that must give the whole place a wonderful charm.

But I suppose everyone who does me the honour of reading these notes will quickly skip the foregoing remarks, and desire to read of the Oakwood orchids. It is, however, no easy matter to deal with these plants in the brief space at disposal. If Mr. Cookson and Mr. Chapman were famous either for odontoglossums, for phaius, for calanthes, for cypripediums, or for dendrobiums, the task would not be so difficult, but they have secured fame for their work in each of these genera, and in others also.

I have previously told how Mr. Cookson purchased his first pair of odontoglossums for a few shillings, and each turned out a really good thing, i.e., O. crispum Cooksoni and O. Andersonianum Cooksoni. But what wonderful plants the collection now contains; indeed, it is probably the finest collection of these cool orchids in existence. O. c. Cooksonæ, O. c. Fr Mazreel, O. c. Lindeni, O. c. Harold, O. Mundyanum, O. c. Raymond Crawshay, O. c. Luciani, O. c. Leemani, O. c. Angela, O. Grairianum, O. percultum Cookson's var. and O. excellens Prince of Orange, are a few of the gems. And there is that latest grand novelty that has brought us so near to a scarlet odontoglossum, the hybrid Odontioda Bradshawiæ Cookson's var., raised at Oakwood. Seedling odontoglossums and odontiodas are plentiful at Oakwood, and there is a great promise of wonders to come, for Mr. Cookson has a long and wide experience of orchid raising, and magnificent varieties to work with.

Hybrid phaiuses are becoming quite popular plants nowadays, and yet it is only [illegible] years since Mr. Cookson crossed P. [illegible] with P. simulans, and produced P. Cooksoni. P. simulans (tuberculosus) has een a favourite parent, and in association ith P. Sanderianus, it gave the variable P. Norman, itself presently becoming rent of P. Clive and P. Harold. By ing P. Humbloti as a parent Mr. Cook[illegible]ained P. Phœbe and P. Cooksoni; [illegible] crossing the first-named with P. [illegible] P. Oakwoodensis was obtained. [illegible] obtained in this genus alone [illegible] suffice to bring fame to the raiser. [illegible] equally valuable has been the improvement made among calanthes, and C. Alexanderi, C. William Murray, C. Bryan, C. Cooksoni, C. Chapmani, C. Sibyl, C. Oakwood Ruby, and several others have all en raised at Oakwood.

Some of the best of the dendrobiums ised at Oakwood are D. Venus, D. Sibyl, D. Cassiope, D. Kenneth, D. Bryan, D. illiam Murray, and D. Dulce. Cypripeums have also received attention, but, as se are (mostly) easily raised, and so many wers have become cypripedium specials, these orchids do not find so much vour at Oakwood as formerly. At present the great interest centres in the crossed and hybrid odontoglossums, and the ontioda, and other bigeneric crosses. If nt successes are an earnest of good gs to come, it is safe to say that, fams as the Oakwood orchids have be[illegible] will attain greater fame in the e future.

ood cultivation must go hand in hand th skilful crossing and successful raising, [illegible] must clever propagation, other[illegible] things may be lost or their [illegible] long delayed. Mr. H. J. [illegible] whose writings are familiar to [illegible] and whose advice on orchid culre is held in the highest estimation, has tire charge of Mr. Cookson's gardens and orchids, and his skill as a grower and raiser is of the highest order.

CHARLES H. CURTIS.

⁂ The second article on "Some Gardens Round Newcastle" will appear in our next issue, and will include descriptions of Willow Wood, and Holeyn Hall Gardens, and of Armstrong and Heaton Parks, and the far-famed Jesmond Dene. One of the charming scenes in this beautiful Dene is given in the present issue—there are others to follow.

WOODLAND SCENE, PRUDHOE HALL.

LATE KEEPING APPLES.

I trespass upon your space with a somewhat unseasonable note, because a correspondent has expressed his disappointment with respect to the keeping properties of some varieties of apples that I some years ago recommended for affording late supplies of fruit. It should be borne in mind by those desirous of having a very late supply of fruit, that to secure it in good condition involves much other careful attention than that of merely planting, and otherwise cultivating late-keeping varieties.

In the first place, it is, of course, essential to plant late varieties, and our thanks are due to the raisers and distributors of both new and little-known apples for having during recent years considerably increased in number the good keeping sorts, and for having caused them to become well known and freely planted.

In order that apples may keep well, it is most important that they are carefully gathered, and each variety must have special attention as to fitness for gathering and be perfectly dry when picked. The fruit must be carefully handled so that it is not bruised, for even slight bruises will accelerate decay; at the same time the fruit must be sorted, and freed of all blemished specimens. It is of little avail to go to the trouble and expense of growing fruit, and then detract from its value by unintelligent gathering, though this is quite an ordinary state of things, a mistake is often thoughtlessly made by gathering late apples too early, and the fruit shrivels as a consequence.

Another matter of equal moment is that of storing the fruit, for, unless this is properly carried out, even the best late varieties that have been most carefully gathered will not keep so long a time as they otherwise would do. It is therefore necessary to make use of a suitably constructed fruit room, in which the fruit may be kept in a uniformly cool state, and be excluded from light. Fire-heat must not be brought into use, except to exclude frost, as a dry atmosphere, especially if promoted by this means, will cause the fruit to shrivel; though it is equally important to avoid, as may be done by careful attention to a rightly constructed room, an atmosphere overcharged with moisture.

If the gathering and storing of late apples is skilfully done (though certainly the state of the weather will have some influence upon this matter), there need be no difficulty in ordinary seasons about their powers of keeping, as may be seen by the splendid collections annually exhibited by Messrs. George Bunyard and Co., and other successful cultivators, at the Royal Horticultural Society's Hall in Vincent Square, Westminster. I will conclude my notes upon this subject with the remark that I feel perfectly satisfied that my correspondent must look elsewhere than to the varieties that I recommended for the cause of his disappointment.

T. COOMBER.

The Hendre, Monmouth.

For pretty gardens and lovely flowers read THE FLOWER GARDEN, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

SOME DIFFICULTIES IN PLANT CULTURE

It is generally acknowledged that our modern intensive cultivation of flowers, fruits, and vegetables for market purposes is beset with many difficulties. To a visitor who strolls about admiring the regularity, thrift, and fruitfulness of every plant in sight it may seem an easy matter to grow violets, carnations, roses, or chrysanthemums, tomatoes, cucumbers, cauliflowers, strawberries, grapes, or peaches, as the case may be.

Certainly nothing seems easier, and just as certainly no business of life is beset with more difficulties, requires more constant attention, more good judgment, more knowledge derived from painful experience, or more thoughtful consideration of every detail of the business. The passing visitor sees the brilliant successes; what he does not see is the long line of mingled successes and failures, the worries and disappointments, the long experience and sleepless care of years which have led up to this consummation.

If he thinks such results are born full fledged out of Mother Earth, and that all one has to do is to plant seeds or set out cuttings, and wait contentedly for the early and the later rains, let him try for himself. It is usually easy to find some eligible market garden with greenhouses attached for sale, and he can begin at once if so inclined, let us say, on cucumbers or tomatoes, for the early spring market. He has himself paid 8d. to 1s. per lb. for tomatoes, and 6d. to 8d. apiece for cucumbers, and knows there is money in it.

Let us follow our optimistic friend for a time, and see what happens. He starts well and early in the first season. He is up with the lark, and overflowing with energy. Things must "gee."

Let us drop in some months later. The plants are not doing well; the crop has practically failed. What is the matter? The seeds were poor, and did not come up, or germinated slowly and irregularly, or the seedlings damped off in great numbers, necessitating a second sowing, which set the crops back, and brought the product into an overflowing market, with poor prices.

Or the soil was not properly selected, and yielded only inferior plants and stunted fruits, in spite of all care and coaxing. Or, possibly, the crop may have started off well, but the gardener or other help did not understand firing, or the management of ventilation, the plants being nearly roasted at times in spite of the plentiful supply of expensive thermometers hung in all parts of the house, and then suddenly chilled with floods of cold air by way of compensation.

Or, finally, perhaps, the chief trouble was in the use of water. The management of water in hothouses is a fine art. Nothing requires better judgment, and in nothing is our friend less experienced. The plants suffered at times, and in particular parts of the house, from lack of water, and then were drenched by the hired man; or the unsatisfied owner, seeing that things were going wrong, took the watering out of the hands of the foreman, and daily flooded the house himself, according to ideas evolved out of his own inner consciousness.

About this time slugs, woodlice, scale insects, red spider, aphides, root nematodes, and a variety of fungus diseases made their appearance in alarming proportions, and an expert in this subject was sent for. Of course, he found a most interesting set of conditions, and possibly was able to afford the disheartened grower the cold comfort of some good advice about what not to do next time.

This may be an extreme case, and yet there are plenty of such cases every year, and the troubles and failures are not all confined to beginners, or to plants grown in hothouses, for even old growers sometimes experience great losses which might have been avoided.

There are now so many people engaged in growing horticultural produce for market, and competition on most crops is so very close, and the profits so small, that even the most experienced and successful grower must stop every leak in his expense account, and take advantage of every little opportunity for increasing the quantity, quality, earliness, etc., of his crops. This he can do only by a thorough understanding of all the conditions necessary for successful growth, the avoidance of parasitic diseases being one very important consideration.

Competition is not likely to decrease, nor are prices likely to advance very much, and the profits must come as a result of avoiding losses. J. J. WILLIS.

Harpenden.

(To be continued.)

EARLY VEGETABLES AND SALADS.

English versus French Methods.

There are numerous cultivators in gardens all over England who are daily becoming more and more interested in intensive cultivation. One reason why that is so is because employers themselves are inquiring into the methods adopted by Continental nations for supplying the English market with what it evidently requires, viz., early dainty salads and vegetables. Now there are hundreds of people who have been forcing both vegetables and salads in English gardens much further back than I can call to mind, and there are those who say that the new system is no good, or that they have done the same sort of thing for generations. Yes, we have grown these crops for very many years, and for 25 years it has always been my endeavour to annually do all that I possibly could to produce a goodly variety of early vegetables, because they are, practically speaking, the paying part.

Our English methods have for generations consisted in preparing manure, and leaves when procurable, for supplying the necessary bottom warmth, and using ordinary garden soil. In some cases more elaborate preparations have been made, and a mixture composed of old potting soil, leaf-mould, sifted wood ashes, etc., all mixed together, has been used. In very many cases we were content with one crop at a time, and, at the most, two; the secondary crop usually consisting of a few radishes raised from seeds scattered over the bed after planting potatoes, or, if carrots were drilled, perhaps a row of radishes might have been taken from between them. It would have been considered an unreasonable act to sow carrots and radish seed broadcast together, and then to crown the whole thing by planting lettuce on the top. Yet this may be done, and with good results, by careful persons who are interested in living vegetation, and who are never so happy as when extracting all they can from the soil. I venture to say that if we had prepared a hotbed a few years ago, with a foot of manure, at the end of February, wheeled on about 9 inches of garden soil, levelled it down, and sown first of all, carrot and radish seed broadcast all over the bed, then proceeded to cover the seed three-quarters of an inch deep, after which bell glasses were to be placed all over the surface, each to contain five lettuce plants, and the intervening spaces between the glasses to be planted with cauliflowers, we should not have believed it possible to do any good with so many things upon so limited a space. Moreover, all these crops are to mature [illegible] fourteen weeks.

I am perfectly certain that a few dozen of these bell glasses would be of the greatest possible service to any gardener who wants to forward early crops, they are so useful to bring along in varying stages the lettuces, endives, and cauliflowers for occupying the frames. The secret is to have hardy sturdy plants wintering under the glasses, which, when transferred to the newly-made hotbeds, respond at once to the [illegible] warmth, and mature very rapidly. I question, too, if we, a few years ago, had such a choice of highly specialised types of vegetables and salads suited for growing and maturing in such a limited space as many are now provided with. The best stocks of carrots for frame growing are those that produce good roots with but little foliage, although this latter character is altered, as in the case of radishes, by thick sowing, which produces all top and no bottom. Good types are any highly selected stock of Early Nantes, Sutton's Champion Horn, Carter's Long Forcing, Rouge Demi-longue de Caretan-sans Cœur, and Rouge tres Courte a Chassis. The larger-bodied shorthorns that are so serviceable in the open are too pale-fleshed and too coarse in the top for frame or bell glass culture. The Champion Horn type, like the highly selected French Breakfast, and Carmine Olive radish, French Frame and Golden Ball type of lettuce, all revel in rich soil composed of half of the previous year's manure and the other half the ordinary garden soil (providing that it is not clay), turned over and mixed together.

For some weeks past our early salad crops have been by far the most interesting and paying part of our produce, showing that it is not necessary to have elaborate or expensive sites for these cultures. Our own frames and bell glasses are arranged in the frame ground over a hard base. What is of the greatest importance is good rich soil, containing plenty of food, for [illegible] upon the fresh manure, and if the seeds used are scattered judiciously, and foresight in raising salads for successional batches under the bell glasses (which allows the maximum amount of light) brought to bear upon the work, the system will be found to yield excellent returns, without the amount of attention that might be thought necessary. The influence the glasses have upon vegetation in an ordinary way was made strikingly [illegible] in these gardens. By placing a number of cabbage plants the second week in February there were excellent big-hearted cabbages at the end of March; those upon the same bed (uncovered) are more than a [illegible] behind. The loss of water by [illegible] is a great drawback to early crops, and the [illegible] of these glasses is, therefore, [illegible] to them. I am beginning to feel that I have lost something in previous years owing to not having adopted the principle [illegible] say what we may, we must admit that there are possibilities in the system, if it is carried out by persons who thoroughly understand gardening in its best form.

CHARLES FOSTER.

Reading.

"LEATHER JACKETS" OR CRANE FLY GRUBS.

The problem of dealing with root-feeding pests in grass land is always cropping up, writes Mr. Cecil Warburton, Zoologist of the Royal Agricultural Society, in his annual report, which appears in the society's journal for the current year. Any real drastic measures are precluded, or grass land ceases to be such, so that more or less indirect methods of treatment have to be resorted to.

With the assistance of Mr. F. W. Foreman I undertook some experiments in September last, the results of which it is as well to record, though they were mainly negative. Their object was twofold:—

(a) To determine if any treatment would kill the grubs without injuring the grass.

(b) To see if by any means the grubs could be induced to come to the surface so that they might be collected and killed.

A variety of compounds were experimented with, including the vapours of hydrocyanic acid and carbon bisulphide, and solutions of formalin, ammonia, carbolic acid, toluene, and other substances.

A large number of "leather-jackets" were obtained, and the direct effect upon some of them of the various insecticides was observed. Others were introduced into an enclosed plot of grass land, cut off from the neighbouring ground by a sheet-iron fence sunk some inches into the soil.

Hydrocyanic (Prussic) acid.—As the cases immediately under consideration concerned certain circumscribed areas—the putting greens of golf links—it seemed worth while to try whether the vapour of hydrocyanic acid could be made to permeate the soil and kill the grubs underground. In order, therefore, to determine whether sufficient diffusion of the gas would take place to have an effect at any considerable distance, generating tubes were buried, and other tubes containing potassium nitrate were also inserted into the ground some distance away. If the vapour reached them in the soil, they would, on analysis, show traces of its presence. No such traces were found. The soil was somewhat heavy, and therefore more unfavourable to diffusion than many, but the experiment was not encouraging.

Carbon bisulphide. — "Leather-jackets" subjected to the fumes in the laboratory were much convulsed and evacuated copiously. The following morning they were limp, and barely alive. Contact with the fluid killed them. It was obvious that the attenuated vapour which it might be possible to diffuse in the soil would be of little use.

Toluene affected the grubs exactly in the same way as carbon bisulphide.

Carbolic acid.—This substance is generally regarded as particularly destructive of insect life. Moreover, it was found that a weak solution (up to ·5 per cent.) had no visible injurious effect on the grass. Unfortunately, however, neither had it on the grubs. Leather-jackets immersed in it for some time seemed unhurt, and were alive and fairly strong the next morning.

Formalin.—Solutions of .5 per cent. and even .2 per cent. discoloured and injured the grass, and further experiments with it were discontinued.

Ammonia.—Leather-jackets have often been alleged to be particularly susceptible fo the destructive effects of this insecticide, from which some good results were anticipated. A ·5 per cent. solution did not hurt the grass, but an application of a 1 per cent. solution discoloured it, and, in addition to the fear of permanent injury, there was a danger that the more delicate grasses would be killed and the coarser species encouraged. Moreover, the direct effects on the grub as ascertained in the laboratory were not at all satisfactory. Subjected to the vapour of a 1 per cent. solution they were only slightly inconvenienced. Immersed in it, they evacuated so profusely as to become almost transparent, but they were all alive the following morning.

The above experiments made it quite clear that the grubs are remarkably difficult to kill, and that it is highly improbable that any substance will be found capable of destroying them in the ground without greatly injuring the grass.

Some of the grubs obtained were sent in situ, in a turf enclosed in a square tin box. They were all found on the top of the turf when the lid was opened in the morning, and this fact suggested the possibility of inducing the leather-jackets in infested ground to come up to the surface by covering the ground over night. No consistent results were obtained, however, nor did copious waterings with any of the insecticides experimented with bring them to the surface with any uuiformity. That they frequently come up and wander about on their own account, especially in the early morning, is a fact well known, and advantage should always be taken of this habit when it is observed. Rolling at such times cannot fail to be useful. Apart from this it seems impracticable to make war upon the creature in the grub stage in grass land.

It is generally agreed that crane-flies have a partiality for certain kinds of ground in which to lay their eggs, and that rank grass on ill-drained soil is especially sought out for that purpose. It is worth noting, however, that a contrary belief existed among observers on the spot in the case which was under investigation. The fly, it was asserted, might be seen to emerge from the pupa case, pair, and deposit eggs in the immediate neighbourhood all within a few minutes, then flying away to be at once picked off by some member of the huge flock of sea-galls, which were attracted by the plague of insects. Unless the movements of the insects were wrongly interpreted, this observation is one of considerable importance, but I am bound to say that it was not corroborated by anything that came under our notice. For some time after emergence the fly appeared very weak and helpless, and when it did begin to move it made a very lame and halting progress over the ground, in a manner which might suggest the laying of eggs. Exact observations on this point would be of interest. In an attack of the common crane-fly, Tipula oleracea, there are, of course, early and belated individuals, but the great bulk of the flies emerge within the space of a few days, though the precise date will vary with the season. About the second week in September is perhaps the most usual time, and it seems likely that vigorous action against the pest at that time would have a considerable effect. The grubs come up to pupate, and the chrysalids stick up half out of the ground. An observer described them as standing up "like matches" in multitudes on the affected greens, and this, it is stated, is only to be observed during two or three days. Constant rolling or even brushing at such times would seem bound to kill great numbers. It might be also possible at such a period so to dress the land as not only to kill the weakly flies as they emerge, but to deter survivors from laying eggs. At all events, where the attack is constantly recurrent it is clear that all energies should be concentrated on dealing with the pest during these few days.

Fuchsias.—These will now be making very rapid growth, and whether they are young plants or old cut back ones, if they are to make good specimens they must receive every attention. Young plants that are being grown on to make specimens for the open air or for the conservatory must now be shifted into 32's or 24-sized pots, using a good, rich, open compost for the purpose. If pyramids are required the plants must have plenty of light all round them, encourging the central growth, and stopping all side growths at every two or three joints. For standards all side growths must be rubbed out to the height required, afterwards stopping the leader and pinching the resulting shoots until the desired size of head is obtained. If wanted for exhibition from six to seven weeks must be allowed from the date of the last stopping.—Thomas Stevenson, Woburn Place Gardens.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CŒLOGYNE DAYANA.—There are few more desirable or more attractive orchids than this species. Where grown as a specimen plant with several trailing spikes of its yellow and brown flowers, nothing is more effective for decoration or exhibition. The flower scapes make their appearance at the present season of the year, being produced from the centre of the new growth. As soon as these are observed every encouragement must be given to assist them to develop. There is sometimes a great difficulty in inducing C. Dayana to flower satisfactorily; I find that there is little difficulty experienced in this respect where the plants are grown altogether in an ordinary plant stove, suspended from the roof. Repotting, when needed, should be attended to immediately after the plants have passed out of flower. It is advisable not to repot more frequently than is absolutely necessary, so that when required good lasting material should be used, such as fibrous peat or osmunda fibre, two parts, to one part of chopped sphagnum moss, and plenty of finely-broken crock and silver sand should be intermixed. Care must be observed in turning the plants out of their pots or baskets to avoid damaging the roots. If they are watered a few hours before repotting it will be found that they remove more readily. Clean away the whole of the old potting compost, and where the plants have a number of leafless old back bulbs, the rhizome should be carefully severed so that they may be removed. This not only adds to the appearance of the plants when repotted, but the old bulbs, if potted into receptacles just large enough to contain them, rarely fail to produce new growths, which, in course of time, add to the stock of this desirable orchid. Thoroughly water as soon as repotting is finished. Liberal treatment is necessary at all seasons, but during active growth a high temperature and humid atmosphere are desirable.

C. PANDURATA.—This species is not so extensively cultivated as its merits deserve. Its green and black flowers are always a great attraction. This I find does well also in the plant stove, in baskets suspended near the roof glass, practically under the same conditions as C. Dayana. It has an elongated rhizome between each pseudo-bulb, and thus requires considerably more space than C. Dayana. It should be placed in oblong baskets, and given ample drainage. A few oak leaves should be mixed with the potting compost mentioned above. The flower scapes appear from the centre of the advancing growth, and repotting may therefore be attended to when the new roots make their appearance. During the active season of growth ample moisture is desirable, and as soon as growth is completed, and throughout the dormant season, only sufficient water is necessary to retain the pseudo-bulbs in a plump state.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY. — This should now be very gay with such subjects as pelargoniums, amaryllis, calceolarias, schizanthus, etc., and it will be found that these require frequent renewal to keep the conservatory bright. The groups should be lightly arranged, and a maximum amount of air given on all favourable occasions. Groups of plants arranged on the floor are, I think, most effective, and have the advantage of being easily seen. One of the best plants to associate with flowering subjects, for lightness and effect, is Bambusa gracilis, and good examples can be grown in any size pot, from a 48 upwards.

ARUMS. — These are now going out of bloom, and may be put out of doors in a sunny position, where they can be protected in case of frost. Do not withhold water too quickly, but give occasional waterings with liquid manure until the leaves begin to die down, when water may be partially withheld for a few weeks. I prefer to keep them in pots during the summer months rather than plant them out, as I find they do not make quite such strong growth early in the autumn as planted-out ones do, but the flowers are equally good, and somewhat earlier.

POT ROSES.—The majority of these will now be going out of bloom, and if they are H.P.'s or H.T.'s it will not pay to keep them indoors after the flowers are cut, so they should be slightly hardened off, and put out of doors in a semi-sheltered position, and if properly watered and fed, they will throw up some good blooms at a time when the outside roses are going over.

CYCLAMEN.—Corms that are to be grown on for another year should be put out in a pit or frame where they will have an abundance of light and air, gradually withholding water as the leaves die down. Seedlings that have been kept growing in a warm house or pit should now be large enough to pot into 60's, using a compost of loam, leaf-soil, and sand with a nice sprinkling of old mortar rubble and wood ashes. Pot fairly firm, with the corm nicely above the surface of the soil, and replace in a house or pit where they may be kept growing quietly, using the syringe fairly freely to keep down thrips, and give shade during the hottest part of the day.

SEEDLING GLOXINIAS AND BEGONIAS should now be fit to transfer into 48-size pots, and the treatment as advised for the cyclamen should suit them well for a time, especially the gloxinias. Begonias are often planted out the first season, and this is really the better plan where bulbs or corms are the first consideration, as they usually make much finer tubers planted out than when kept in pots. Gradually harden them off in 60's or boxes, as the case may be, and plant out in prepared beds as early as possible in June, keeping them well watered and attended to during the summer, when they will make very fine tubers for the following season.

CHRYSANTHEMUMS.—The present is a very suitable time to stake and stand out chrysanthemums in the open air, whether for exhibition or for decorative purposes, choosing a position for them somewhat out of the wind, or the foliage may be damaged. What little frost we are likely to have now will in no way injure them, providing they have been properly hardened off. My own plants have had the lights off most nights for over a fortnight. — THOMAS STEVENSON, Woburn Place Gardens.

THE FLOWER GARDEN.

BULBS. — These have done remarkably well this season, and it has been my fortune to have seen some very fine collections, especially of narcissi. It is, indeed, remarkable to think what has been accomplished during recent years in this direction; not only in the improvement of varieties, but the methods of planting for bold and pleasing effect. The naturalisation of these charming spring flowers is now more the rule than the exception. Even naturalisation of narcissi requires to be carried out with care and judgment, both as to the arrangement of colour and the shapes of the groups; otherwise much of the charm is lost. Clumps that are so arranged as to present straight lines are generally very objectionable, and this should be guarded against. All the bulbs that have been forced under glass in the spring should be taken care of, and planted out in their respective positions. On very heavy soils the better plan is to make large holes with an iron bar, and fill in with fine light soil, making it fairly firm. As far as possible, arrange the varieties in separate masses.

VIOLETS. — The stocks of the several varieties in favour may now be increased by dividing the old roots and planting them on well-prepared ground, for choice in a fairly shaded part of the garden. Plant out in rows one foot apart each way. To ensure clean, healthy stock, which may be required for planting under glass in the autumn, it is necessary that the plants are kept well supplied with water during the summer months, both at the roots and over the foliage, to prevent red-spider attacking them.

BAMBOOS.—This is the best season during the whole year for transplanting these, and the majority of the varieties will divide quite easily, and grow away freely if a little care is given them. The ground should be deeply worked, and well enriched with short horse manure, and topdressed with the same kind of material. Old plants will be much benefited by judicious thinning, and a good surface dressing of stable manure. Sheltered positions, as far as possible, should be selected for bamboos, as both severe frosts and cold, cutting winds mar the beauty of their foliage.

VIOLAS. — Autumn-struck plants that have been wintered in cold frames should now be planted out in their permanent positions. The soil should be made fairly rich, and the plants be transferred to their new position with a good ball. Make the soil very firm about them, and peg down and stop the growths. Violas produce a charming effect when planted on narrow borders in blocks of colour, which should be so arranged as to present a pleasing appearance.

PENTSTEMONS.—No time should now be lost in planting these out on ground which has been well prepared during the winter months. Fork over and neatly rake down the surface, and allow a good distance between both the plants and the rows. Seedlings should be planted out on rather poor ground, when they will be found to flower much more freely.

ANTIRRHINUMS.—Autumn-struck plants should be planted out in their respective positions one foot apart each way.

HOLLYHOCKS. — Harden off seedling plants, and plant out on good ground quite by the middle of the month.

ANNUALS.—These will pay for pricking off from the seed pans or boxes, before planting them in their permanent quarters. Skeleton pits answer well for this purpose for the majority, where a little protection can be afforded them in case of frosts, but zinnias, salpiglossis, and a few of the more tender kinds will need the assistance of glass for some time yet.—E. BECKETT, Aldenham House Gardens.

HARDY FRUITS.

RASPBERRIES, LOGANBERRIES, AND BLACKBERRIES will now be pushing up a lot of young growths, and three or four of the strongest of these, growing close to the old stools, should be reserved, and trained in for next season's fruiting, while all the others should be pulled up, so that the strength of the plants may be concentrated into those left. Other young shoots will continue to push up during the summer, and these must be removed as soon as they have grown sufficiently long to be handled.

STRAWBERRIES. — These will now be pushing up their flower trusses, and the beds should have a mulching of some light, strawy material, for the purpose of keeping the fruits clean. The first flowers which open generally produce the finest fruits, and if a little of the dry portion of the mulching be drawn lightly over the plants on an evening when frosts seem imminent, it will often be the means of saving these first fruits. Before placing on the mulching, see that the beds are quite clear of weeds, and if no weeds are noticed, it will be beneficial to the plants if the surface is loosened with the Dutch hoe. Thinning is not often practised, unless choice dessert fruits are required, but one is amply repaid for the time spent in removing (as soon as a reasonable crop is set), the surplus fruits and late flowers, the results being that the fruits will be of better quality, the crop quite as weighty, and the strain on the plants much less than if the whole of the fruits had been left to mature.

PEACHES AND NECTARINES.—Continue to remove the surplus growths from these. The usual practice is to leave a healthy shoot growing at the base and on the upper side of the older wood. The young points on the growths which are carrying fruit should be pinched back to the second or third leaf, unless wanted for extension, that the energy of the branch may be concentrated in swelling up the fruit, and in perfecting the young shoot reserved for next year's fruiting. Trees which have reached their extent of wall-space should have the points of the leading growths pinched closely back, but the main branches on young trees should be allowed to extend, but not to such an extent as would tend to weaken the young growths at the base of the trees; endeavour to keep the centre and lower portion of the tree well furnished with healthy young wood. Remove all badly-placed and immature fruits, and reserve those which are swelling up satisfactorily, trying to have the fruits at the final thinning evenly distributed over the trees.

GOOSEBERRY CATERPILLAR. — Examine the trees frequently for any signs of this pest, and destroy every one that can be seen by rubbing the leaf on which the caterpillars are feeding between the finger and thumb. A little attention to this matter at this season of the year will save a lot of trouble later on. Protecting material may be taken away now, as the foliage is sufficiently developed to act as a protection to the young fruits. As soon as the fruits are well set on wall trees, let the syringe be used freely among them during the latter part of the afternoon, using clean soft water; but on the first appearance of aphis or red-spider spray with a reliable insecticide at once.—GEO. WOODGATE, Rolleston Hall Gardens.

THE SAFFRON-COLOURED SAXIFRAGE.

While this plant (Saxifraga mutata) seems to have arrogated to itself the name of Saffron-coloured Saxifrage, there are others as worthy of the name because of their colouring, but as it has already been named thus, we must let it pass. It is a beautiful and interesting species from the Swiss and Italian Alps, and is noticeable even among a large collection of such flowers from the viscid hairs which cover nearly all parts of the plant, and from the colour — almost saffron-yellow — of its pointed petals. The flowers are small, but they are produced on stems which are sometimes a foot high, and the changes in the colouring from saffron to pale yellow as the blooms age, is interesting. Then this interest is increased too by the presence in the centre of each bloom of a bright purple glandular material when it expands.

But, pretty and distinct as is Saxifraga mutata, there is a fly in the amber, as it is not long lived in many of our gardens, and often succumbs to our wet and changeable winters. It is, in fact, treated by many good growers as simply a biennial, and plants are either raised from seeds annually or the offsets are taken off and kept in pots during winter. Only the enthusiast will care to do this, but the less devoted cultivator of alpines will, probably, content himself by giving Saxifraga mutata a dry position on the rockery and by placing over it, to keep off the wet, a sheet of glass, or a small bell-glass. Introduced as far back as 1779, this saxifrage is now a rare occupant of British gardens.

S. ARNOTT

Everyone interested in a garden should [illegible] a copy of the ALPHABET OF GARDENING, by T. W. Sanders. Thoroughly practical information [illegible] to soils, manures, seed sowing, planting, hybridising, budding, pruning, grafting, forcing. Price 1s. [illegible] with explanatory diagrams. [illegible] post 1s. 9d.; cloth, 2s.; by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate [illegible] London.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

MAY 4.

On this date the hall was again uncomfortably full of both exhibits and people. Not only the hall proper, but the annexes also were packed with exhibits. Hardy flowers were abundant, and about two-thirds of these might well have been left at home, as they were neither interesting nor useful. It seems quite time the R.H.S. Council put a severe limitation upon the display of the commoner subjects. Orchids were less numerous than usual, daffodils had almost gone since the previous meeting, and tulips were not at their best. Rhododendrons were fine, and cinerarias, early vegetables, auriculas, and carnations were all attractive and interesting. Several of the new plants were of special merit.

FLORAL COMMITTEE.

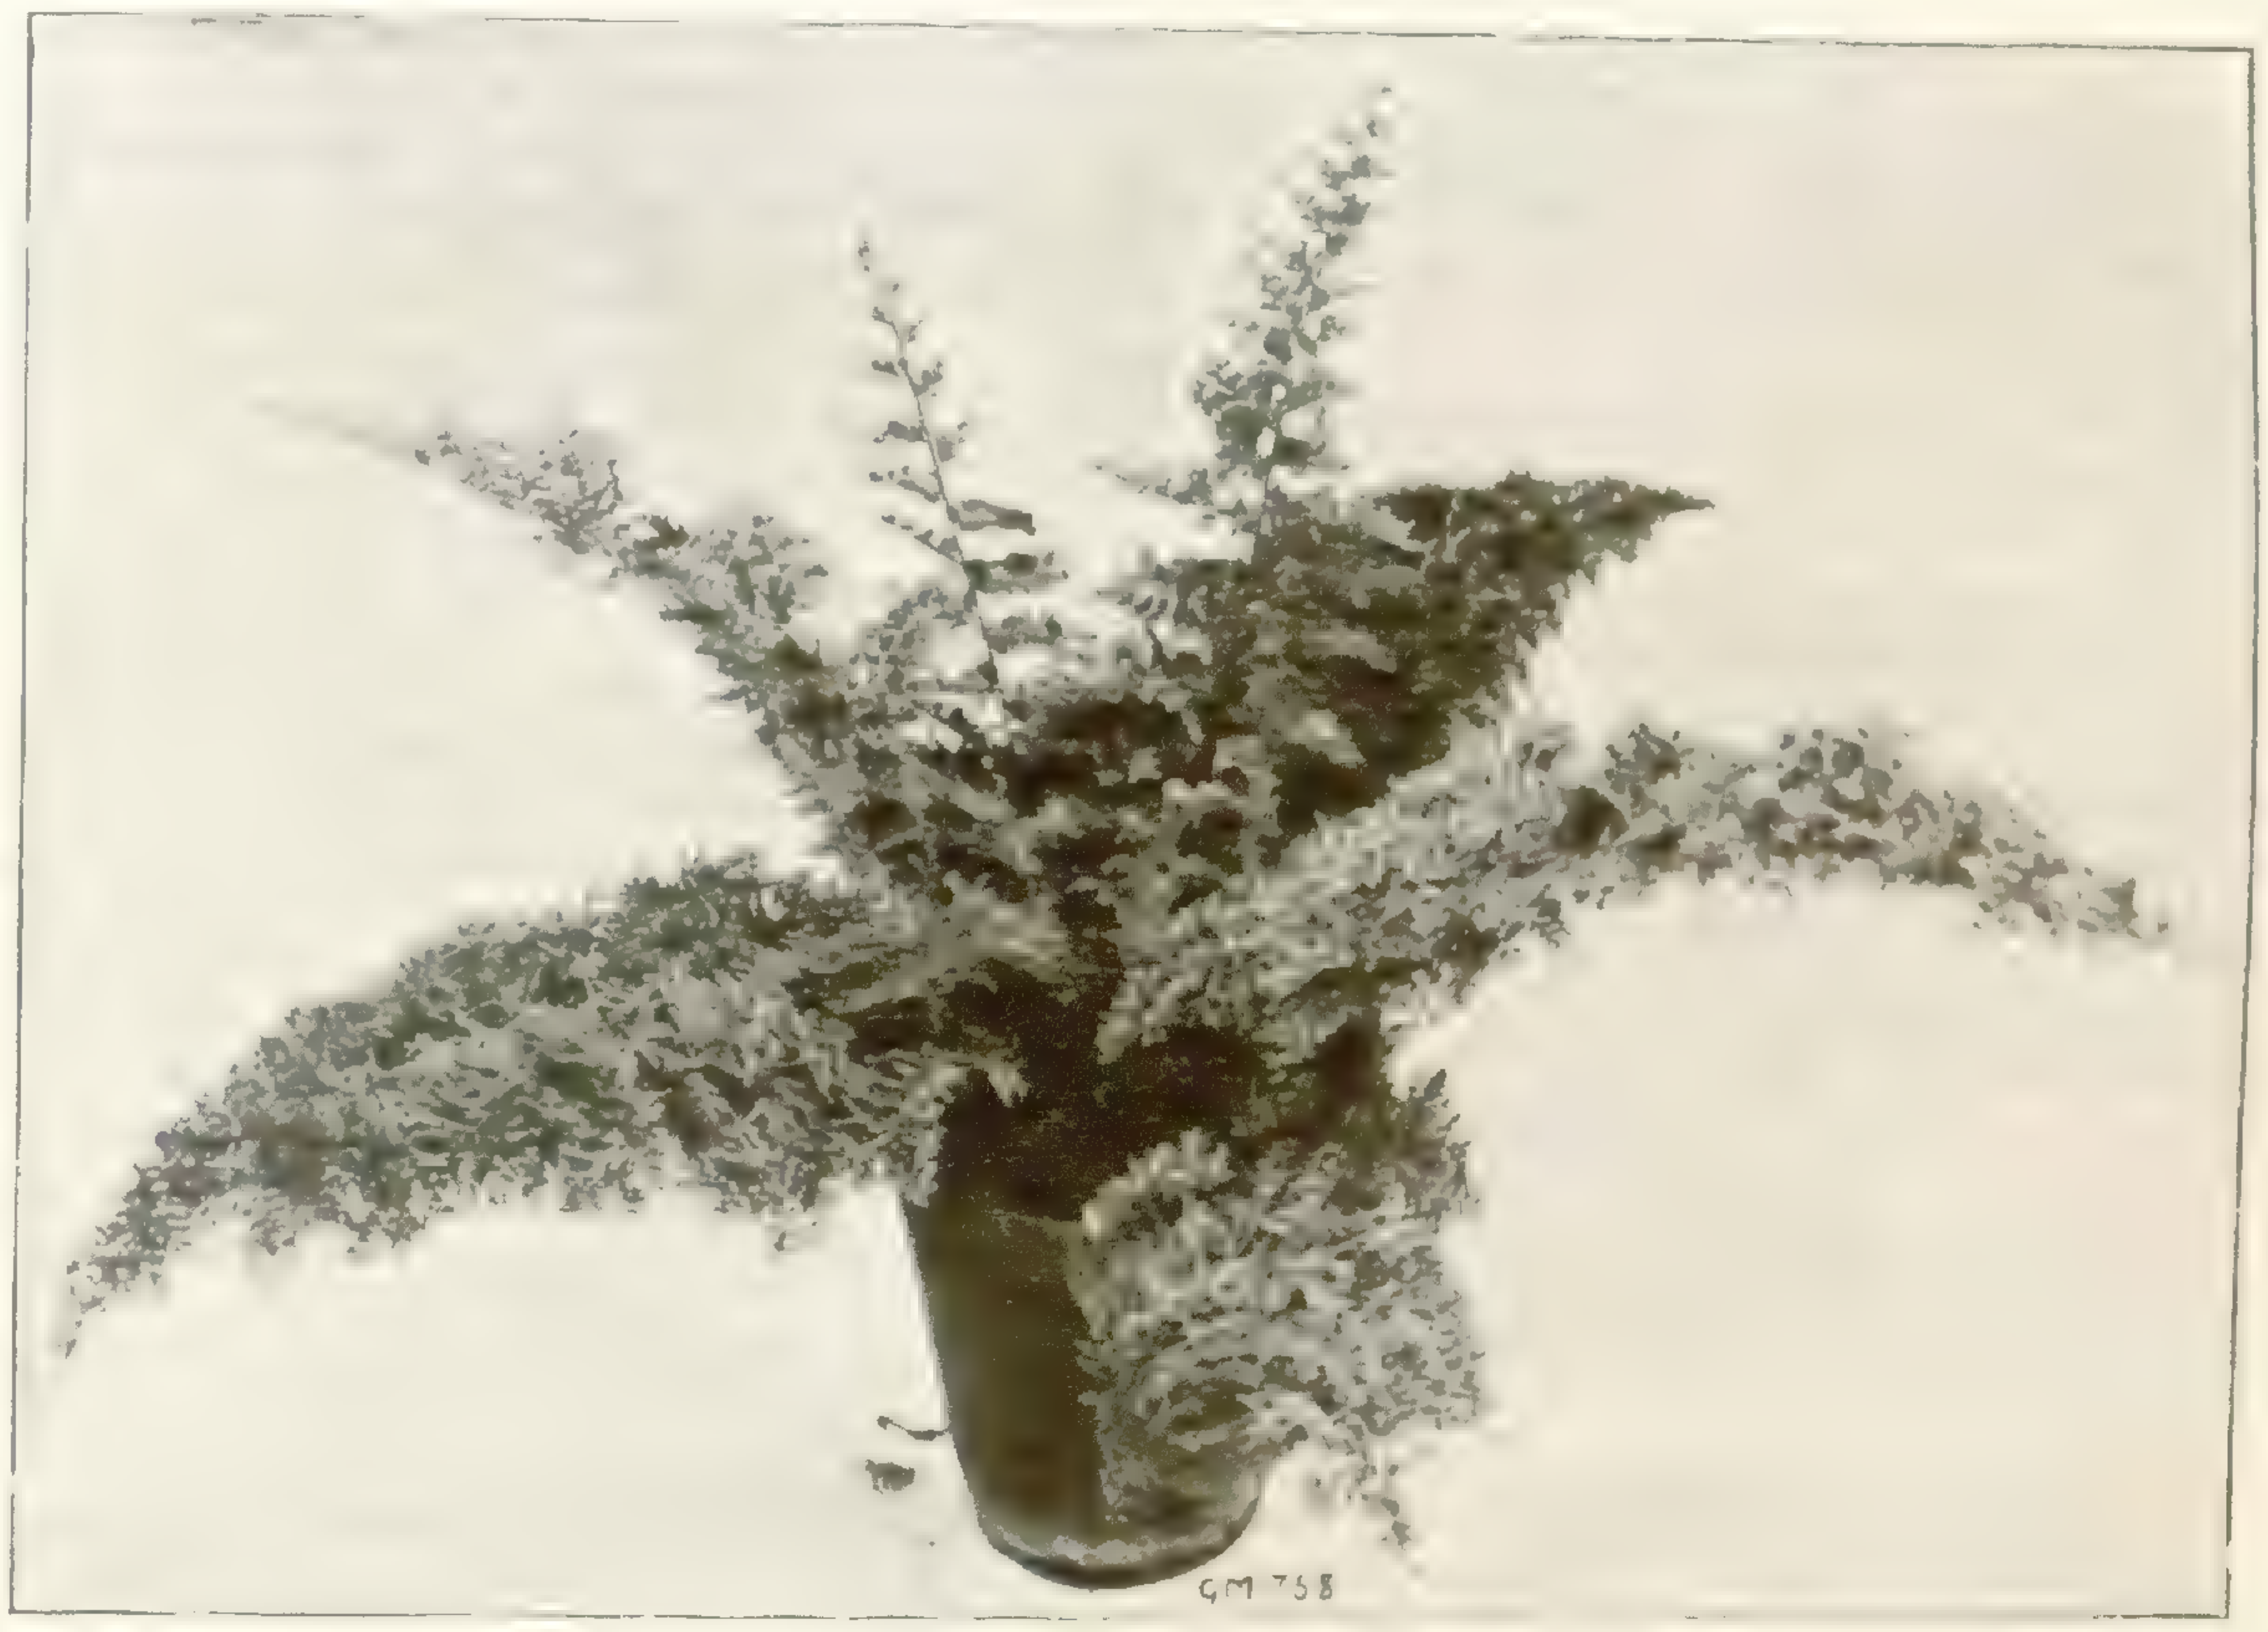
A magnificent group of cut roses, one of the finest we have seen for a long time, was set up in bold fashion by Mr. G. Mount, Canterbury. The blooms were of grand quality, and in great quantity. The varieties were Mrs. John Laing, General MacArthur, Captain Hayward, Mdme. Abel Chatenay, Liberty, Frau Karl Druschki (grand), Mrs. Sharman Crawford, Richmond, Mildred Grant, Ulrich Brunner, Joseph Lowe, and the new Rhea Reid. It was one of Mr. Mount's best efforts, and was evidence of the highest culture. Messrs. Wm. Paul and Son, Waltham Cross, set up a large corner group of pillar roses in great variety, edged with the free-flowering Aennchen Muller. Messrs. B. Cant and Sons, Colchester, were represented by pillar roses and bushes of Austrian Yellow and the vivid Austrian Copper roses. Messrs. Frank Cant and Co., Colchester, had pillar and rambling roses, and a good stand of blooms of Marechal Niel. Very beautiful was the group of the lovely Rhododendron Pink Pearl, put up by Messrs. J. Waterer and Sons, Lim., Bagshot, Surrey.

Mr. Amos Perry, Winchmore Hill, showed a collection of hardy flowers, the fine La Reve tulip showing up well with fritillarias and irises, etc. Messrs. J. Cheal and Sons, Crawley, contributed a collection of flowering shrubs that proved very interesting. Lotus peliorhynchus and the bold Gaillardia Lady Rolleston were features of the group set up by Messrs. W. and J. Brown, Peterborough. Rambling roses in pots were finely shown by Mr. G. Prince, Longworth, Berks, Hiawatha, Blush Rambler, and Crimson Rambler being well represented. The Lyon Rose, Mrs. Longworth, and Frau Karl Druschki were other roses well shown. Scented-leaved pelargoniums were extensively shown by Messrs. Heath and Son, Cheltenham, who also showed numerous hybrid [illegible], such as Shottesham Pet, Prince of Orange, Scarlet Unique, Pretty Polly, Dale Park Beauty, and other old favourites.

Messrs. Jas. Veitch and Sons, Chelsea, were large exhibitors. They contributed a beautiful bank of the charming Schizanthus Veitch's grandiflorus hybrids, the plants all grandly grown, and smothered with their orchid-like flowers; they had a bank of tulips and daffodils, a group of gorgeous Phyllocacti, a group of the handsome Primula Unique (A.M.), the rosy-red cross between P. pulverulenta and P. Cockburniana; Cineraria flavescens (A.M.), a pretty cream-coloured cross between C. Feltham Beauty and Senecio auriculatissima; and a fine group of sprays of Cerasus Watereri. Messrs. Gilbert and Son, Dyke, Bourne, presented a group of the brilliant Anemone fulgens, and the double King of Scarlets, all very beautiful and bright. Mr. W. P. Horton, Cravenhurst, Seaford, Sussex, made a poor attempt at a rock garden display. The bank of Azalea mollis from Messrs. R. and G. Cuthbert, Southgate, again demonstrated the usefulness of this fine flowering shrub. Messrs. Bakers, Wolverhampton, sent violas, polyanthuses, and aubrietias in variety. Mr. M. Prichard, Christchurch, Hants, submitted a collection of choice hardy flowers backed by Japanese maples. Messrs. Hugh Low and Co., Enfield, showed the new white Hydrangea hortensis alba (A.M.), dwarf and standard roses, azaleas, gerberas, pink spiræas, etc. The very interesting Tacca cristata with eleven of its weird, whiskered spikes of dull maroon-purple flowers, from Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Dorking, attracted a great deal of attention; far more beautiful was the white, fragrant Viburnum Carlesi (F.C.C.), from the Burford collection.

Alpines in great variety, and Japanese maples came from Messrs. J. Peed and Son, West Norwood, and a grand bank of splendidly-selected and finely-grown polyanthuses was set up by Mr. S. Mortimer, Farnham. Messrs. G. Jackman and Son, Woking, submitted varieties of Primula Sieboldi, trilliums, Rehmannia angulata, etc. Messrs. Robert Veitch and Son, Exeter, displayed a bank of choice rhododendrons, the set including R. arboreum varieties, R. Campylocarpum, R. Thomsoni, R. Hodgsoni, the grand R. Glory of Penjerrick, and the lovely white R. Dr. Stocker, R. Shillsoni, the fine R. Countess of Haddington, R. Falconeri, and R. cinnabarina. Mr. H. Burnett, Guernsey, again brought up a grand lot of perpetual carnations.

A beautiful and large group of cinerarias was arranged prettily by Messrs. Jas. Carter and Co., Holborn. The centre part was entirely of the elegant Stellate varieties in various shades of colour, and this was margined and flanked by the larger florists' varieties, for which the Holborn firm is famous. Very sweet also was the group of finely-grown heliotropes from the King's Acre Nursery Co., Hereford; Mdme. Fillary, Mdlle. Marie Andre, Lord Rosebery, and Docteur Jeulin were the leading varieties, and there were both dwarf and standard plants. Mr. H. C. Pulham, Elsenham, had a small rockwork exhibit. Messrs. Paul and Son, Cheshunt, sent rare shrubs, including the variegated Catalpa pulverulenta, and Berchemia racemosa variegata. Saxifraga Clibrani came from Messrs. Clibrans, Altrincham: it is a very free-flowered, reddish-purple, mossy variety. Messrs. Dobbie and Co., Rothesay, had another splendid exhibit of pansies and violas, and included a set of blooms cut from plants that were planted in the open field at Marks Tey in the autumn of 1907.



NEPHROLEPIS LYCOPODIOIDES.

A.M., R.H.S., May 4. Messrs. T. Rochford and Sons, Broxbourne. A new fern, with much-divided moss-like fronds of great elegance and beauty.

Sweet peas were brought up for the first time this year by Mr. C. W. Breadmore, Winchester, who had Kathleen MacGowan, the new creamy Princess Juliana, King Alfonso, Audrey Crier, Princess Victoria, and Helen Lewis; Mr. Breadmore also showed a few very fine flowers of popular carnations. Messrs. G. and A. Clark, Dover, showed a few early sweet peas, and a group of hardy flowers in great variety, and a few plants of the new double white marguerite named Perfection, a fine variety for conservatory use, or for making wreaths, etc.

Very pretty, vastly interesting, and unusually attractive were the alpine and show auriculas presented so finely by Mr. James Douglas, Great Bookham, Surrey. It was probably the finest lot Mr. Douglas has yet staged. The alpine varieties attracted our attention mostly, and of these we were specially struck by Daffodil, May Day, Rosy Morn, Old Gold, Teviotdale, Argus, Ziska, Moonbeams, and Queenie. Mr. Douglas also showed big specimens of Myosotidium nobile, the big forget-me-not-like flower from the Chatham Islands. Ferns were finely shown by Messrs. H. B. May and Son, Edmonton, who had a collection of Nephrolepises, notably N. Amerpohli, and N. todeaoides; davallias and gymnogrammas were also shown, and in another group, pansies, petunias, verbenas, and pelargoniums.

Malmaison carnations were again beautifully shown by Mr. A. Grubb, gardener to Cecil F. Raphael, Esq., Porter's Park, Shenley, who arranged a big group of freely-flowered plants of Lady Rose, Old Blush, Princess of Wales, King Arthur, and Maggie Hodgson. Messrs. Phillips and Taylor, Bracknell, contributed a good set of alpine auriculas, Phlox Laphami, and various annuals. Very fine flowers of the popular perpetual carnations, together with a bold bank of forced flowering shrubs, were arranged by Messrs. W. Cutbush and Son, Highgate.

Messrs. T. Rochford and Sons, Broxbourne, sent up the very beautiful Nephrolepis lycopodioides (A.M.), a variety with finely-divided, mossy fronds. Messrs. W. Wood and Son, Wood Green, presented a selection of garden sundries, their shading materials attracting chief attention.

Mr. G. Reuthe, Keston, Kent, brought up

a collection of alpines. Mr. R. Gill, Falmouth, presented some very fine flowers of the choicer Himalayan rhododendrons. Messrs. T. S. Ware, Feltham, sent Primula Sieboldi in great variety, and a fine bank of Androsace Chumbyi.

Messrs. H. Cannell and Sons, Swanley, showed a grand lot of cut pelargoniums in splendid bunches, and a few plants of a grand bright rose-pink single rose named Beauty of Eynsford, staged as a dwarf sport from American Pillar; if it retains its dwarf habit it will be a fine addition.

ORCHID COMMITTEE.

Mr. Maurice Mertens, Mont St. Amand, Ghent, brought over some beautiful odontoglossums and cattleyas. Mr. A. W. Jensen, Lindfield, Hayward's Heath, staged a grand specimen of Cattleya Mendeli with ninety-six flowers and buds. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, showed the magnificent Lælio-cattleya Dr. R. Schiffman Westonbirt var. (F.C.C.)—splendid in form, large, soft purple, with rich violet-purple lip, a grand flower; and Odontoglossum Phœbe Westonbirt var. Messrs. J. and A. McBean, Cooksbridge, showed a deeply-coloured form of Cymbidium insigne, named Rotunda. From Sir Trevor Lawrence's collection at Burford Lodge, Mr. W. H. White brought up several botanical orchids. Mr. F. Wellesley, Westfield, Woking, submitted good forms of Cattleya Mendeli, and Mr. J. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, Woodford, showed the interesting Lælio-cattleya The Baron.

Messrs. J. Cypher and Sons brought up a fine bank of orchids, in which were Lælia purpurata in variety, L.-c. Hyeana, Vanda suavis, Odontoglossum Pescatorei, Dendrobium atro-sanguineum, Scuticaria Hadweni, and Cœlogyne tomentosa, etc. Messrs. Hugh Low and Co., sent up a batch of the pretty Dendrobium barbatulum, D. Pierardi, D. thyrsiflorum, Oncidium pulchellum, and good forms of Cattleya Mendeli. The fine Odontoglossum Andersonianum Crawshayanum, finely grown, was sent by Mr. H. J. Chapman, gardener to N. C. Cookson, Esq., Oakwood, Wylam-on-Tyne. In Messrs. Charlesworth and Co.'s small group of orchids there were Bifrenaria Harrisonæ, Odontoglossum armainvillierense xanthotes, Cattleya Empress Frederick, and Lælio-cattleya G. S. Ball.

Messrs. J. and A. McBean, Cooksbridge, showed Cymbidium Lowianum concolor, Cattleya Mendeli, and the rare Odontoglossum crispum Oakwood Sunrise. Odontioda Vuylstekeæ was shown by Messrs. Wm. Bull and Sons, Chelsea. De Barri Crawshay, Esq., Rosefield, Sevenoaks, again brought up Odontoglossum Theodora, and also Odontioda Charlesworthi Theodora. Mr. H. T. Pitt, Stamford Hill, sent Brasso-cattleya Rosslyn. Mr. J. Rutherford, Beardwood, Blackburn, showed Odontoglossum amabile in fine form, with a grand spike, and several other orchids.

DAFFODIL COMMITTEE.

A large and beautiful display of daffodils, set up by Messrs. Barr and Sons, Covent Garden, was greatly admired. The flowers were fresh and clean, and, in addition to popular kinds, there were good flowers of White Lady, Fire Queen, Lord Morley, Czarina, Odorus rugulosus maximus, Masterpiece, Challenger, Ice Queen, and Warley Scarlet. With the daffodils the Messrs. Barr showed dwarf irises, aubrietias, and the beautiful Tritonia Prince of Orange. Messrs. Sutton and Sons, Reading, showed a beautiful white, citron-cupped daffodil, named Delicata, a strong, free garden variety.

Mr. H. D. Phillips, Olton, Warwickshire, had a group of new and rare daffodils, all very fresh and prettily set-up. Prominent among the named varieties were the fine orange-cupped Seville, Incognita, Rosie, Glitter, Thelma, Homer, Lemon Drop, White Lady, Rosella, Cavalier, Albatross, Duchess of Westminster, and Gloria Mundi. Very brilliant was the display of tulips made by Messrs. Hogg and Robertson, Mary Street, Dublin, who had fine blooms of Clothilde, Pink Beauty, Cerise Gris de Lin, Water Lily, Golden Eagle, Lac van Haarlem, Golden Lion, Lac van Rhyn, La Reve, and La Remarquable.

Messrs. R. Wallace and Co., Colchester, sent up a few tulips, their Darwin varieties being in very good form. Messrs. Wm. Bull and Sons, Chelsea, showed daffodils and tulips in rather stiff bunches. Messrs. G. Bunyard and Co., Maidstone, brought up alpines and early hardy flowers.

Messrs. R. H. Bath, Lim., Wisbech, were represented by a bank of clean and bright tulips, and a selection of daffodils, the latter including Grandeur, Mdme. de Graaff, Homer, Torch, Una, Epic, Will Scarlet, and other good things. Miss F. W. Currey, Lismore, Ireland; Mr. H. Chapman, Rye; and the Rev. G. H. Engleheart, Dinton, each showed a few new daffodils.

FRUIT AND VEGETABLE COMMITTEE.

Particularly interesting was the collection of early vegetables and salads submitted by Messrs. Sutton and Sons, Reading, all fresh and tempting. There was asparagus, Early Market tomatoes, Earliest of All, Golden Ball, Early Paris, and Commodore Nutt lettuces, April cabbages, various radishes, Scarlet Horn carrots, Sutton's Market cucumbers, and Long Parisian turnips. Mr. J. W. Funge, gardener to Mrs. Bischoffsheim, Warren House, Stanmore, sent well-fruited plants of the pale-coloured but highly-flavoured Louis Gauthier strawberry.

Early vegetables were contributed by Messrs. Jas. Veitch and Sons, Chelsea, and these included Ham Green tomatoes, Golden Queen, Paris Market, and Black Crepe lettuces, various radishes, Gradus peas, and Incomparable cabbages. The same firm showed well-kept apples, the best dishes being of Bess Pool, Newton Wonder, Bramley's Seedling, Barnack Beauty, Alfriston, Norfolk Beaufin, and Dumelow's Seedling.

In the amateurs' class for strawberries Mr. H. Gardner, gardener to Lord Foley, Ruxley Lodge, Esher, beat Mr. J. Vert, gardener to Lord Howard de Walden, both showing Royal Sovereign. In the trade class Messrs. J. and F. Chatfield, Southwick, Sussex, secured first prize with Royal Sovereign, Bedfordshire Champion, and La Grosse Sucree.

MEDALS.

Gold.—Mr. George Mount, Canterbury, for roses; Mr. Jas. Douglas, Great Bookham, Surrey, for auriculas.

Silver-Gilt Flora.—Mr. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, Shenley, for carnations; Messrs. Jas. Veitch and Sons, Chelsea, for phyllocacti, etc.; Messrs. Robert Veitch and Son, Exeter, for rhododendrons.

Silver-Gilt Banksian.—Messrs. John Peed and Son, West Norwood, for alpines, etc.; Mr. M. Prichard, Christchurch, for hardy flowers; Messrs. Barr and Sons, Covent Garden, for daffodils and tulips.

Silver Flora.—Messrs. B. R. Cant and Sons, Colchester, for pot roses; Messrs. Wm. Paul and Son, Waltham Cross, for roses in pots; Messrs. Jas. Carter and Co., Holborn, for cinerarias; Messrs. W. Cutbush and Son, Highgate, for carnations and shrubs; Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; Mr. H. D. Phillips, Olton, for daffodils.

Silver Knightian. — Messrs. Sutton and Sons, Reading, for early vegetables and salads.

Silver Banksian.—Messrs. Bakers, Wolverhampton, for alpines; Mr. H. Burnett, Guernsey, for carnations; Messrs. Frank Cant and Co., Colchester, for roses; Messrs. G. and A. Clark, Dover, for hardy flowers; Mr. R. Gill, Falmouth, for rhododendrons; King's Acre Nursery Co., Hereford, for heliotropes; Messrs. Dobbie and Co., Rothesay, for violas and pansies; Messrs. Hugh Low and Co., Enfield, for carnations, etc.; Messrs. John Waterer and Co., Bagshot, for rhododendrons; Messrs. Hogg and Robertson, Dublin, for tulips; Messrs. R. H. Bath, Lim., Wisbech, for daffodils and tulips; Mr. H. Cave, Mangotsfield, Bristol, for daffodils.

Bronze Flora.—Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; Messrs. H. Cannell and Sons, Swanley, for pelargoniums; Mr. S. Mortimer, Farnham, for polyanthuses; Messrs. Paul and Son, Cheshunt, for shrubs; Mr. Amos Perry, Enfield, for hardy flowers; Mr. G. Reuthe, Keston, for alpines; Messrs. T. S. Ware, Lim., Feltham, for primulas.

CERTIFICATES AND AWARDS.

First-Class Certificates.—To Lælio-cattleya Dr. R. Schiffman Westonbirt var., from Lieut.-Colonel Holford, Westonbirt, Gloucester.

To Viburnum Carlesi, from Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

Award of Merit.—To Saxifraga Clibrani, from Messrs. Clibrans, Manchester.

To Nephrolepis lycopodioides, from Messrs. T. Rochford and Sons, Broxbourne.

To Cineraria flavescens, from Messrs. Jas. Veitch and Sons, Chelsea.

To Primula Unique, from Messrs. Jas. Veitch and Sons, Chelsea.

To Saxifraga decipiens Arkwrighti, from Messrs. Bakers, Codsall.

To Hydrangea hortensis alba, from Messrs. Hugh Low and Co., Enfield.

Norwich Spring Show.

This fixture was held on the 29th ult., in St. Andrew's Hall, Norwich. It was the prettiest arranged show that the Norfolk and Norwich Horticultural Society has held for many years, and great credit is due to Mr. William Smith, the hon. secretary, and his staff. The chief feature was the grand display of narcissi and daffodils. The best came from Mr. George Davison, gardener to Colonel Petre, Westwick, who had the cream of the trumpet kinds, and some seedlings of his own, of great merit. Two of these, named Elizabeth and Julius Cæsar, were awarded first class certificates. The former is remarkable for its perfect perianth. Mr. A. Woodhouse, gardener to the Master of the Rolls, at his Norfolk residence, Letheringsett, made a bold display. A striking feature of his was one group containing just over 100 different kinds in the various types, and the flowers were perfect specimens. The other classes for cut flowers also brought out some keen contests, the principal exhibitors being Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham Park; Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead; Mr. W. Allan, Gunton Hall Gardens; Mr. George Davison, Westwick; Mr. F. Neave, Lingwood; and Mr. W. Laws, gardener to G. E. White, Esq., Eaton.

The pot plant section was responsible for a remarkable display of stellate cinerarias, four collections of a dozen plants each being staged for prizes given by Messrs. Sutton and Sons. Some of the plants were a yard across the heads of bloom. Messrs. Sutton's representative was so pleased with them that he had a special photograph taken of the batch. Another good feature was the circular group of plants 8ft. in diameter. In this class Mr. W. Palmer, gardener to I. B. Coaks, Esq., Thorpe, won first prize with a most graceful arrangement of pink and white flowers, with light foliage plants. Mr. H. Andrews, gardener to Captain Meade, Earsham Hall, had in his group some fine amaryllis and vandas. There were well-filled classes also for calceolarias, mignonette, pelargoniums, and lilies in pots. Orchids came in strong force from Mr. H. Rider Haggard's gardens at Ditchingham, his very large cymbidiums evoking great interest. Miss Violet Fellowes, Shotesham, also had some fine specimens in this section.

Fruits were represented by strawberries only, Mr. U. Wright, gardener to W. J. Birbeck, Esq., Stratton Strawless Hall, taking first prize for both gathered fruits and half-a-dozen pots. Vegetables were not a large feature, and Mr. W. Chettleburgh took the principal prizes in the section.

Messrs. Daniels Brothers, Lim., Norwich, made a nice display of pot plants of many kinds, and a bold bank of cut anemones. Messrs. Hobbies, Lim., Dereham, showed roses in great variety as bushes and standards, and they were quite up to date, exhibiting Veitchenblau, the blue rose.

"Indispensable"

BIRD'S CUSTARD with RHUBARB

Nutritious, Wholesome and Healthful.

"THE DISH OF THE DAY."

The Book that Makes Gardening a Pleasure.

THE . . .

ENCYCLOPAEDIA OF GARDENING.

By T. W. SANDERS, F.L.S., F.R.H.S.,
Editor of "Amateur Gardening"

A COMPLETE GUIDE AND DICTIONARY to the Culture, Propagation and Description of Flowers, Fruit, Vegetables, Plants, Trees, Shrubs, &c., including Time of Planting, Colour, Height, Time of Flowering, &c.

Crown 8vo, 482 pages, bound in cloth. NET 3/6 By Post 3/10.

Published at "THE GARDENERS' MAGAZINE" OFFICE, 148 & 149, Aldersgate Street, London, E.C.

Mr. R. C. Notcutt, Woodbridge, had a display of flowering trees and shrubs. Messrs. B. R. Cant and Son, Colchester, put up a beautiful display of roses in pots, and also cut blooms, and from a box of seedling blooms of about seven kinds they secured three first class certificates. Messrs. Sutton and Sons, Reading, came along with a brilliant display of cinerarias and winter-flowering stocks. Mr. Daws, of Syderstone, made a good display of his new rhubarb.

Although the show was not patronised to the extent one would like, we are glad to be able to record that the admission money went up nearly £5 over the previous year.

Huntingdonshire Spring Flower Society.

At the fourth show of the above society, held at Huntingdon, there was a record attendance and entry. Messrs. Barr's Daffodil Cup was won by H. R. Darlington, Esq., Potter's Bar; J. Cator, Esq., Woodbastwick, being second, and Miss Linton, Buckden, third. Some splendid trade exhibits included those from Messrs. Barr and Sons, R. H. Bath, Lim., Messrs. J. R. Pearson and Sons, Lowdham; Mr. J. Mallender, Bawtry, with seedling daffodils. Messrs. W. and J. Brown, Perkins, and Laxton sent general spring flowers, and Mr. Reuthe, of Keston, Kent, showed a capital lot of alpines, etc. Lady De Ramsey and Messrs. Laxtons' showed American tree carnations, prominent among which were Harlowarden, White Perfection, and Enchantress, Rose Enchantress, Jessica, and Challenger.

The celebrated Radeski Band discoursed sweet music at intervals with enjoyable results, and altogether it may be said to have been a charming exhibition.

Reading and District Gardeners' Association.

By the kind permission of Sir William Farrer, this association had, on Monday, April 26, the opportunity (a privilege more than once enjoyed before), of visiting the unique gardens at Sandhurst Lodge. A party of between seventy and eighty, which included Mr. Leonard Sutton (vice-president) and Mr. W. Pole-Routh, travelled by the 4.20 p.m. train to Wellington College Station (special accommodation having been provided), several others were picked up at Earley and Wokingham, the number being largely increased at the end of the railway journey by the cycling brigade and members residing in the immediate neighbourhood, until on assembling for tea at the Wellington College Hotel, the party had swelled to about 140.

Tea, provided by the generosity of Sir William Farrer, was at once proceeded with, and at the close of the repast a hearty vote of thanks to Sir William for his hospitality was proposed by the Vice-President, and seconded by the Chairman of the association, the members expressing their appreciation of the kindness shown by giving three hearty cheers. In the unavoidable absence of Sir William Farrer, Mr. Townsend, the head gardener, welcomed the association in the name of his employer, and a move was at once made in the direction of the gardens.

The particular attraction at Sandhurst Lodge at the present season is the unrivalled collection of daffodils, narcissi, tulips, etc., which are grown here, not in the formal fashion one is so accustomed to see them, but by their thousands among the lovely flowering shrubs, under the trees, on the margin of streams and ponds, or grouped in the grass, making a picture that must be seen to be properly appreciated. In the borders, too, daffodils, in conjunction with myosotis and polyanthus, make lovely colour combinations, which clearly indicate the care and skill bestowed by the master hand of the head gardener. When it is mentioned that, apart from bulbs, etc., Mr. Townsend annually plants out, for the adornment of the woodland garden, 3,000 Primula japonica and 6,000 polyanthus, some idea of the lovely effect can be imagined.

Needless to say, no part of the extensive gardens was left unexplored, while Mr. Townsend was ever ready to give the benefit of his extensive knowledge and experience to any member of the party anxious to learn. The time for departure arrived all too quickly, steps being taken in the direction of the S.E.R., compartments having been reserved on the 7.40 p.m. train for those returning by rail. As the train moved off, cheers were given for Mr. Townsend and his staff for the way in which they had contributed to such an enjoyable outing.

RED OR GRIZZLY GRAPES.

There has been no need for me to enter into the controversy raised by Mr. E. Molyneux over an article of mine on the merits of Red or Grizzly grapes, because others with greater experience have shown the value of varieties that, by reason of their red or "foxy" colouring, are, in the main, despised.

Mr. Molyneux must have been a little surprised when he opened his "Journal" of the R.H.S., and turned to page 502, where, among the "Commonplace Notes," is the following:

"There are many indications that the craze for size and appearance in fruit is on the wane, and those possessing first-class flavour are again finding favour. Among new grapes 'Prince of Wales' is sure to take a leading position, because of its splendid appearance, size, and flavour. It originated as a sport from 'Mrs. Pince,' and possesses all the excellent qualities of its parent, with the addition of a handsome bunch of perfect form, a larger blue-black berry of a roundish-oval shape, and a crisp delicious Muscat flavour. At Wisley it has proved a strong, sturdy grower, free bearer, and very free setter. Another remarkably fine grape, by no means new, but seldom seen, is 'Muscat Champion,' one of the boldest berried varieties grown, quite as large as 'Gros Colmar' or 'Canon Hall Muscat,' but of a foxy-red colour, tinged with green; many not only object to this colour, but some might imagine the fruit was not properly ripe; yet, in spite of this, no finer flavoured grape is grown, and where high quality is desired it can be strongly recommended. In the Wisley collection it was much admired for its big bunches, robust habit, and superb flavour. Another red or foxy grape that used to be extensively grown, but is now rarely met with, is 'Grizzly Frontignan'—the best of all the Frontignan varieties—with a long slender bunch of small red berries of the most exquisite flavour. All the Frontignans are delicious, but none will compare with the 'Grizzly.' One of the earliest and smallest berried grapes is 'Ascot Citronelle,' ripening its fruit quite a fortnight before 'Black Hamburgh' growing in the same house; the flavour is excellent, the bunches rather small, but abundantly produced, and the berries a lovely amber tint when fully ripe. For pot cultivation this is a valuable variety. We have nowhere seen or heard of this variety except in the society's gardens. 'Lady Hastings' is another new grape, a sport from 'Muscat Hamburgh,' with all the delicious flavour of its parent, but with a stronger constitution, not so fastidious as to soil and treatment as 'Muscat Hamburgh,' and bearing larger bunches and berries."

Although not all of the note bears directly on the subject of red grapes, I have given it in its entirety, lest I might be accused of omission, and a desire to discredit black and white grapes. As further evidence of the fact that many good flavoured grapes have been set aside by good-looking ones, and that this matter is likely to be put straight in due course, I may say that the request for "eyes" of Muscat Champion grape has been far in excess of the supply.

C. H. CURTIS.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CAUSTIC DRESSING FOR FRUIT TREES. — G., Erdington: You must be a quite new reader of the GARDENERS' MAGAZINE, or you would know that the caustic soda and potash mixture is entirely unsuitable for use as a fruit tree dressing except when the trees are leafless and dormant. Write us again in the autumn, and we will explain how to prepare and use the mixture

STUDENTS AT WISLEY. — H. C. M., Stroud: The Royal Horticultural Society admits a limited number of young men to study gardening in their gardens at Wisley. Most of these students have the advantage of attending some of the society's meetings and shows, and all are thoroughly trained in every branch of practical horticulture, both in the open and under glass. A laboratory has been built in order that they may be well grounded in elementary chemistry, geology, etc. "It is generally easy to find these young men employment on the completion of their training, in fact, the Council are quite unable to meet the demand for energetic, trustworthy young men, but they must all be workers." For full particulars apply to the Secretary, Royal Horticultural Society, Vincent Square, Westminster, S.W.

BIG BUDS ON BLACK CURRANTS.—M. J., Selkirk: The shoots sent prove beyond all doubt that your black currants are badly infested with the dreaded currant bud mite (Eriophyes ribis). In our issue of May 1, p. 346, and also in our issue of April 24, p. 328, we gave particulars of this pest, and how best to deal with an attack. We refer you to these issues.

GRIZZLY FRONTIGNAN GRAPE.—West Surrey: This highly flavoured grape was introduced in 1654 by Sir Wm. Temple, and was at one time very largely grown, but the advent of big-berried black varieties and its own red or "foxy" colouring led to its disuse. It has a tendency to shank if grown in a cool house, and in tenacious soil. It is easily grown, sets freely, and crops heavily and will succeed with Black Hamburgh where the latter is not given cool-house treatment. It is quite likely you have seen this variety grown on house fronts and verandahs in France, where it is known as Muscat Gris and Muscat Rouge. Excessive cropping and overwatering must be avoided, as these tend to produce shanking. A little more lateral growth may also be permitted in Grizzly Frontignan, as compared with Black Hamburgh.

DISEASED TOMATOES.—G. P., Thame: The specimen sent is suffering from the peculiar form of the leaf-rust disease in which the blotched leaves are accompanied by black stripings on the stems. It is a very destructive plague, and infected plants should be removed and burned, those remaining being sprayed at intervals of about ten days with a weak Bordeaux mixture, or a weak solution of potassium sulphide.

PEACH SOLD FOR THE BENEFIT OF THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—M. J., Exeter: You are not quite correct, because it was a nectarine, and not a peach that was sold for the benefit of the institution. Dr. Hogg tells the story of how Lord Prudhoe received stones of a

Do Not Allow Plants Under Glass to be overdone and dried up by excessive sunshine. A 1/- packet will shade 100 square feet of glass.

tarine from the Vice-Consul at Aleppo, and these were sown in March, 1843. The first fruits ripened in 1846, and Lord Prudhoe, who had then become Duke of Northumberland, placed the variety in the hands of Mr. Rivers, of Sawbridgeworth, and on May 15, 1850, the stock of twenty-four plants was sold by auction, and realised £164 17s., which his Grace handed over to the fund. The name of Stanwick was given to the nectarine because it was at Stanwick Park the variety was raised.

KESWICK CODLIN APPLE.—C. K. P., Ipswich: This useful old apple was discovered near Ulverston growing among a lot of rubbish behind a wall at Gleaston Castle. It came under the notice of Mr. J. Sander, a Keswick nurseryman, who propagated it and distributed it as Keswick Codlin. As far back as 1813, he spoke in terms of high praise of this apple, which, he said, had cropped regularly at Rose Castle, Carlisle, for twenty years.

SPOTTED MELON LEAVES.—C. B. C., Exmouth: The dull white, well-defined, roundish spots are a sure indication of an attack of the melon spot mould (Cercospora Melonis), a pest that attacks cucumbers also. What are the causes that contribute to an attack we do not know, but excessive root moisture during dull weather appears to produce conditions favourable to an attack. Cut off and burn infected leaves, spray the plants with weak Bordeaux mixture, and attend very carefully to watering and heating.

DIMORPHOTHECA AURANTIACA.—R. D., Ludlow: This is a beautiful and brilliant South African annual, and one that thrives best in poor soil, and in a very sunny position—at least, that is our experience so far. After making their rough leaves the seedlings should be transferred to small pots, singly, otherwise they seem to make little progress for a long time, but when newly potted they root freely, and grow away well in a greenhouse. Duly harden the plants in a frame, and plant out in early June or at the end of May.

ACREAGE OF FRUITS IN GREAT BRITAIN.—N. R. D., Lyme Regis: It is estimated that there are 308,859 acres under fruit culture in Great Britain, apportioned as follows: Apples, 172,643 acres; strawberries, 27,827 acres; currants and gooseberries, 25,590 acres; small fruits in orchards, 23,492 acres; various small fruits, 19,880 acres; raspberries, 8,878 acres; cherries, 12,027 acres; plums, 14,901 acres; pears, 8,911 acres; and other orchard fruits, 41,694 acres.

PUBLIC PARKS AND GARDENS.—B. S., Plympton: A very complete list of the public parks and gardens in the United Kingdom, with their area, superintendents, etc., is published in the "Gardening Year Book for 1909," which can be obtained from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C., for 1s. 2d. post free. The book contains descriptions of the new plants for 1908, and much other valuable information.

NAMES OF PLANTS.

W. A., Harpenden.—Cattleya Schroderæ.

L. C., Crawley.—Dendrobium Devonianum.

O. B. L., Newport.—1, Cotoneaster horizontalis; 2, Azara microphylla.

"**Small Holders' Guide.**"—This manual, dealing with the subject of small holdings and their successful management, is now being published by Messrs. W. H. and L. Collingridge, 148, Aldersgate Street, London. The book should prove of much value to all who are interested in a subject that is foremost with dwellers in rural districts. The aim of the volume is to afford information on how to acquire a small holding, and on the best methods of working it when in occupation. The price is 1s. (by post 1s. 2d.); or in cloth 1s. 6d. (by post 1s. 9d.).

Solanums.—These useful berried plants for the winter months should not be neglected. Cuttings that were rooted in February or March should by now be nice plants in 60's, and to ensure them being nicely berried they should be planted out, preferably in a frame on an old half-spent hotbed, in a sunny position. They should be planted from 15 to 18 inches apart in fairly rich soil, and kept close in the frame for a few days until root-action commences, when more air may be given, finally leaving the lights off altogether. As soon as they have taken hold of the soil they should be pinched at about three inches high, and if they do not throw out enough side shoots they may be pinched again, but do not aim at too dense a plant or the flowers will not set so freely as in a loosely-grown one, but try and get the wood to grow freely so that there is a good crop of bloom at once, and when it is seen they are setting freely and the plants are large enough, take out the point of each shoot. This treatment will add to the size of the berries. Old plants may also be treated in this way, but as they are larger, the open ground might suit them quite as well. Frequent syringings will be found necessary, as solanums are very subject to attacks of green-fly.—T. STEVENSON.

TRADE NOTE.

An illustrated pamphlet from the Harrow Nursery Co., Harrow, Middlesex, reminds us that the season is at hand when effective shading materials will be in demand. The Split Bamboo Blinds in which the firm deals, are very serviceable, neat, and inexpensive. The pamphlet gives descriptions and prices of blinds for all purposes.

FORTHCOMING ENGAGEMENTS.

MONDAY, May 10.—United Horticultural Benefit and Provident Society.

WEDNESDAY, May 12.—Royal Society of Arts. East Anglian Horticultural Club.

TUESDAY, May 18.—Royal Horticultural Society: Daffodil and Tulip Committee at 11.30 a.m.; Fruit, Floral, and Orchid Committees at 12 o'clock; Lecture at 3 p.m.; Scientific Committee at 4 o'clock.

TUESDAY, May 25.—Royal Horticultural Society's Great Exhibition at the Inner Temple Gardens, three days.

Kew Guild Annual Meeting at the Holborn Restaurant at 7.30, to be followed by the Annual Dinner.
